4. Being is immaterial. This becomes a "content" claim, although it originates in apophatic assertions where God is said repeatedly to be beyond space, time and the Aristotelian categories (*Quod Deus Sit Immutabilis* II; *Quis Rerum Divinarum Heres*, 187).
5. Being is "unchangeable" (*Legum Allegoria* II 9, 33, 24).<sup>24</sup>
6. Being is *Mind*, absolute or universal Intelligence. The Forms are God's thoughts (*De Opificio Mundi* 17-19); their "place" is the Logos of God (*De Opificio Mundi*, 20; *De Cherubim*, 49).<sup>25</sup>
7. The Forms are the cosmic blueprint. They become actualized through the Divine Will rather than by necessity as emphasized by Plato (with some ambiguity in the *Timaeus*) and Aristotle and then Plotinus and his pagan disciples.
8. God's freedom of action is connected to the deeply held premise that "It is the property (*idion*) of God to act" (*De Cherubim*, 24, 77). Impelled by the Biblical account, Philo insists that: "It is impious and false to conceive of God in a state of complete inactivity. We ought . . . to be astounded at His powers as maker and Father" (*De Opificio Mundi*, 2, 7).<sup>26</sup>

9. Moreover, as "Maker and Father," God acts "benevolently" (*Legum Allegoria*, III, 68) and out of His "goodness" (*Legum Allegoria*, I, 15; *De Abrahamo*, 268).

This much then is clear, the principle of ineffability is certainly elastic. Unless one wishes to crush Philo in a logical vise, it must be taken nonliterally.

Beyond this, the exegesis of Philo's large corpus reveals something still more philosophically fecund. His God, however "ineffable," is rooted conceptually in a matrix that is both Greek and Jewish. Philo is at his most philonic in his valiant struggle to do justice to both traditions and in his effort to show their ultimate harmony and congruence. Thus his "apophatic" readings are highly colored, fundamentally shaped, by the inherited problematics of Middle Platonism as they had developed in the Hellenistic age—in particular by the problems of eidetic causation and participation. Yet, simultaneously, Philo's *Weltanschauung* demands the centrality of the Torah, although, conversely, the sinaitic revelation must conform to the truths discerned by the immortal Plato. Thus there is no disjunction between the God of the philosophers and the God of Abraham, Isaac and Jacob. The Philonic One, to use the Platonic/Plotinian terminology, must be understood as a response to specific ontological problems, Greek and Hebraic. The notions of Being, Will, and Necessity that Philo wrestles with come to him with a history and a rich penumbra of meanings. So it was not "being" or "necessary being" in some neutral sense that Philo predicated of the God of Israel, but "Being" understood in a well-defined, channelized philosophical tradition oriented by distinctive conceptions, say of limit and form. And his rendering of God as a subject is consciously and critically shaped by his effort to adjudicate between the Aristotelian principle of necessity and the Biblical insistence on Divine Freedom.

The Jewish Neoplatonists who came after Philo would continue to struggle with their dual inheritance of necessity and freedom. One sees the contradictions resulting from the attempt in Isaac Israeli's obscure, confused and confusing treatment in *The Book of Elements*.<sup>27</sup> Israeli seeks to reconcile the conceptual obligations imposed by the scriptural claims for God's will with the canonical theory of Neoplatonic emanation by distinguishing between the One's

willed creation of the first two simple substances and the "necessary" emanation of all further things. Whether, as Alexander Altmann proposed, this entailed a dual theory of creation—the first two substances and then emanation for the rest—or, as Harry Wolfson contended, a dual theory of emanation, need not detain us.<sup>28</sup> What is significant for our argument is that the One of Israeli, the first important medieval Jewish Neoplatonist, is the resultant of a historical development that decisively influenced its nuanced formulation, even while Israeli claimed the inability to comprehend this God.

Given the prominence of the issue and Israeli's failure to treat it adequately, it is not surprising that Solomon Ibn Gabirol returns to it in his *Mekor Hayyim* (II 17-20), arguing for an emanationist theory while maintaining the Hebraic volitional imperative by attributing the creation of form to the Divine Will and the creation of matter to God's essence, i.e., necessity. Given Ibn Gabirol's close affinity to the mainstream of pagan Neoplatonism,<sup>29</sup> his positing of a Divine Will is striking.<sup>30</sup> Yet Ibn Gabirol, like the Ikhwān al-Ṣafā', the Muslim Sincere Brethren (tenth Century),<sup>31</sup> rejects the Plotinian doctrine of "spontaneous necessity"<sup>32</sup> and the versions of this teaching widely circulated, for example in the *Theology of Aristotle* and its Arabic forms. He opts instead for the reality and repercussive significance of the Divine Will at the origin of the emanative process. Even in the Latin, the *Mekor Hayyim* makes abundantly clear that "The creation of things by the Creator, the going out of the forms from the prime source, is from the will (*voluntate*)."<sup>33</sup> One has only to compare this to Plotinus' treatments of the same stage in the creative process to appreciate its Biblical resonances. Plotinus writes: "There is in everything the act of the essence and the act of going out from the essence: the first act is the thing itself in its realized identity, the second act is an *inevitably* following outgo from the first, an emanation distinct from the thing itself."<sup>34</sup> I am not dissuaded from seeing here a sharp disjunction between Ibn Gabirol and Plotinus, despite Rist's nondeterministic reading, which seems to me anachronistic.<sup>35</sup>

It is illuminating to trace these two 'traditions,' the Philonic and Plotinian, a stage further, among the post *Bahir*-Kabbalists. Those influenced more heavily by the tradition stemming from Plotinus, Proclus, and Pseudo-Dionysius argued not only for the absolute

transcendence and ineffability of the 'Eyn Sof, but also for its impersonality. Others, like Philo before them, were more sensitive to the scriptural imperatives affecting the doctrine of the One. They sought to "personalize" the One, referring to *ha-'Eyn Sof*, the Infinite, rather than just 'Eyn Sof, that which is "Endless" or "Boundless." Both formulations appear in the *Zohar*, but it certainly seems to favor the Philonic view, at least with regard to the question of God's freedom to create. The position was later taken up by Moses Cordovero in his Commentary on the *Zohar* and by Isaac Luria in his remarkable teaching that the first movement of creation was made possible by God's willed self-contraction (*zimzum*).<sup>36</sup> The supernal reality that the *Zohar* calls the *Attika Kadisha* ("the Holy Ancient One") indeed is more than pure negation possessing Will. The exact relation of 'Eyn Sof or *ha-'Eyn Sof* to the *Attika Kadisha* is the subject of widespread debate, but there is no question that the *Tikkunei Zohar* specifically and clearly teaches that the two are identical: "It is called 'Eyn Sof internally and *Keter Elyon* externally."<sup>37</sup> Yet, paradoxically, even as these assertions are being argued over, all the Kabbalists agree that nothing can be known or said about 'Eyn Sof.

Given this philosophical and mystical tradition, we can make two generalizations: (1) 'God,' or the 'One,' or the 'Absolute,' is not only a name, an arbitrary verbal sign, a cipher, but also and necessarily in all meaningful contexts, at least, a "disguised description." The many Philonic excursions on God's names, especially the Tetragrammaton, and the theurgical power of the NAME, of such great importance to Kabbalists, should be reconsidered in light of this recognition. (2) Even the One about whom one can offer only negations, who transcends all predicates, is a definite individual: the 'disguised descriptions' establish a meaning-giving context that shapes the content of their descriptiveness. Thus, for example, in Philo, in the Plotinian tradition,<sup>38</sup> in the Spanish Jewish Neoplatonists, and in the *mekubbalim* (masters of the Kabbalah), there is agreement that the negation of all attributes is *not* an indication of negativity *per se*, of nothingness or meaninglessness. Nor is it an indication that at the center of being there is only randomness and chaos. Rather, in contradistinction to a negative reading of negation, it must be recognized that the One is intrinsically

good, as both Plato (*Republic* VI 509C) and Scripture taught. This Good is *the* creative origin and designing *telos* of all that is. All comes from and returns to the One/Good.

Thus, Isaac Israeli attributes creation-emanation to the One's goodness alone. The identity of the One is informed by the meaning-giving context of a tradition which imputes goodness to the One. The co-incidence of the One with the Good as the Source of creation is a profoundly charged and content-ful *assumption* of classical Western thought. In no way is it an assumption that is necessary *a priori*. Certain Buddhist schools and certain modern scientific accounts attribute no such positive status to the One that they posit as the point of cosmic origination.

Ibn Gabirol expresses this affirmative presumption with paradigmatic clarity in his *Keter Malkhut*. At the end of stanza 3 he proclaims the apophatic dogma:

Thou existeth, and Thy secret is hidden, and who shall attain to it?  
*Atiah nimza', ve-sodkha ne'elam; u-mi-yasigenu.*  
 So deep, so deep, who can discover it?  
*'Amok 'amok, mi yimza'enu?*

Yet in stanza 6, the *Ehad*, the One of stanza 2, is, as the God of Israel must be, the One "Who forbearst long with sinners" (*ta'arikh l'hata'im*) and Whose "mercies are upon all thy creatures, yea upon all of them" (*rahamekha 'al kol beru'ekha, khulam*). The secret and hidden One is not only existent but knowably concerned with human sin, forbearing, ultimately forgiving, and merciful to all. These attributions of grace and mercy are positive construals of the Goodness of the One, despite the obligatory negations entailed by the mature Neoplatonic schema. And this movement from ineffability to positive attribution is no mere poetic image suitable to the *Keter Malkhut* but inapposite in the more rigorous domains of Neoplatonic philosophy. For in the rigorously philosophical *Mekor Hayyim* Ibn Gabirol calls the One *ha-Po'el ha-ri'shon ve-ha-kadosh* ("First Author, sublime and holy").

A third conclusion about the work of most Jewish and other Neoplatonists, inextricably connected with what I shall call the logic of emanation, appears warranted as well. This conclusion follows from the logical, ontological and linguistic implications of the process

of emanation and the relationship of the One to the realities that flow from It and can be summarized as follows: Given the definition of emanation there is a particular and informative reciprocity between the One and the many. For example, Philo can point to the outcome of Divine action, creation, as affording some inferential awareness of Him. Likening the Platonic Forms to Biblical "causes," i.e., to Divine Action, he argues, glossing Moses' prayer in *Exodus*, that "He himself alone is incomprehensible—but He may come to be apprehended and known by the powers that follow and attend Him." Philo immediately adds the qualification: "These make evident not His essence but His existence,"<sup>39</sup> but his remark is especially provocative given the ontological implications of an emanationist metaphysics, i.e., that cause and effect are in some primal and definitive sense the same.

Plotinus tells us, despite all his negations, that the central concept of ontic participation unfolds against the background of the emanationist principle: "The One is all things and no one of them; the source of all things is not all things; and yet it is all things in a transcendental sense, all things, so to speak, having run back to it; or more correctly, not all as yet are within it, they will be."<sup>40</sup> Thus, "The One remains intact . . . since the entities produced in its likeness . . . owe their existence to no other." "Just as there is, primarily or secondarily, some form or idea from the monad in each of the successive numbers—the later still participating though unequally, in the unit—so the series of Beings following upon the first bear, each some form or idea derived from the source."<sup>41</sup> Thus things incorporate, reflect and reveal that from which they derive. Indirectly, then, insofar as we can speak of 'things' we are describing or naming something of the One. Plotinian emanation implicates the One cataphatically as a consequence of its ontological choreography.

Similarly, R. Azriel of Gerona, explaining the emanation of the *Sefirot*, writes:

I have already informed you that 'Eyn Sof is perfect . . . that the agent which is (initially) brought forth from Him must also be perfect. Thus the dynamic of emanation is fittingly the beginning of all creation, for the potency of emanation is the essence of all things.

And extending this exegesis he affirms:

The One is the foundation of the many, and in the many no power is innovated—only in Him . . . although this first is the dynamic order of the other . . . the metaphor for this is the fire, the flame, the sparks . . . they are all of one essence.<sup>42</sup>

The emanation of the *Sefirot* is a process within the Godhead, not a descent into space-time, but R. Azriel's description does lead us to ask what it is that we may potentially come to know, to say, of the 'Eyn Sof. Given that "that potency of emanation is the essence of all things" and that the *Sefirot* (by definition) "are all one essence" with the One ('Eyn Sof) does it not follow that our unquestioned ability to know the *Sefirot* entails that we can in some sense know the 'Eyn Sof? As Gershom Scholem writes, "The hidden God in the aspect of the 'Eyn Sof and the God manifested in the emanation of the 'Eyn Sof are one and the same viewed from two different angles."<sup>43</sup> Analogously, among later Kabbalists, whatever the hermeneutical and metaphysical ambiguities, there emerges a Kabbalistic consensus that the emanative process continues downward and is responsible for the sublunary and material worlds. So these lower realms also participate in and reflect the *Sefirot* from which they emerge. Even if at a remove, they are continuous with the 'Eyn Sof. Even in the '*alma de-peruda*, the world of separation, when things are seen mystically, i.e., properly, "everything is revealed as One."<sup>44</sup> As a consequence, at a far lower level, we can learn about the 'Eyn Sof (through the mediation of the *Sefirot*) by way of the things in our world. By knowing and naming these we know and name the 'Eyn Sof, obliquely but authentically. Moses de Leon, the author of the *Zohar*, notes in his *Sefer Ha-Rimmon*:

Everything is linked with everything else down to the lowest ring of the chain, and the true essence of God is above as well as below, in the heavens and on the earth, and nothing exists outside of him. . . . Meditate on these things and you will understand that God's essence is linked and connected with all worlds, and that all forms of existence are linked and connected with each other, but derived from His existence and essence.<sup>45</sup>

Correspondingly, the inherent dialectic of return to the Source, seeking felicity by reversing the ontic process of differentiation and

procession that is central to both Kabbalah and philosophical Jewish Neoplatonism, is rooted in the metaphysical unity of all things from above to below. The elemental doctrines of *nizozot* (sparks), *bittul ha-yesh* (annihilation), *hithpashtuth* (egression), and *histalkuth* (regression) are all connected with and to be deciphered by reference to the primordial participation of all that is in the 'Eyn Sof through the "mediation" of the *Sefirot*, which are manifestations of the Godhead itself. In this way the theory of regress, the inversion of the metaphysics of emanation, like emanation itself, raises profound ontological, linguistic and logical questions. For it casts new light, perhaps some would say shadows, over the status of the 'Eyn Sof's transcendence of all conceptual and linguistic forms.

The regressive accessibility of the One allows the possibility of *devekut* or union beyond intellection or language, of which the Kabbalists and philosophers speak. The recommendation and the hope which seeks this end are predicated on the assumption that ultimately there is a commonality, a shared ontic nature, that will become apparent and dominant once linguistic and categorical restraints have dropped away in the ascent, or return, of the soul to its source. In the Neoplatonic expression of R. Ezra: "Everything issues from the first cause and everything returns to the first cause"; or, in a more messianic form, in the end we will experience "*hashavat kol ha-devarim le-havvayatam*" ("the restoration of all things to their original being.")<sup>46</sup> Given the possibility of *devekut* and of the return of the *Sefirot* to *Ayin*, can we say that we know nothing and can say nothing of 'Eyn Sof?

Similarly, the doctrine of emanation has profound implications for Jewish and other Neoplatonic moral theories that, like Bahya's and Ibn Zaddik's, and even more like Ibn Gabirol's in his *Tikkun Middot ha-Nefesh* (*Improvement of the Moral Qualities*),<sup>47</sup> presume that the human capacity for ethical perfection resides in our derivation from the One through the creative devolution operative in the universe. Once again, then, more is "sayable" about the essential Goodness of Being than the overt declarations of the Neoplatonists would suggest. Insofar as moral theories implicate and depend upon anthropological conceptions—including the much favored doctrine of the microcosm—for all the qualifications they would introduce at this juncture, the Neoplatonic moralists point to still further venues in

which the 'Eyn Sof/One, incarnate in men, is available to cognitive scrutiny and linguistic description.

Still more generally, the emanationist model presumes a hierarchial descent from the 'Eyn Sof and correspondingly relates "degrees of being" to one's place in the hierarchy: the "higher" and closer to the 'Eyn Sof, the more "spiritual"; the "lower" and further from the 'Eyn Sof, the more "material." This scheme is unescapably conceptual and linguistic. It depends for its cogency upon an order of beings, "beyond which," although somehow related, is the One. The egress of meta-Being/'Eyn-Sof to Being/*Sefirot*, i.e., the emanation of 'Olam ha-*azilut*, down to the emanation of material beings in the 'Olam ha-*'asiyyah*, our terrestrial world, and the regress from 'Olam ha-*'asiyyah* to the Sefirotic realm and then to *Ayin* is a process that is, in a real sense, cataphatic. This is evident, for example, in the first systematic use of the notion of 'Eyn Sof by R. Isaac the Blind. In his teachings on the first *Sefirah*, i.e., his views relating to *mahshavah* (thought) as co-incident with 'Eyn Sof and *mahshavah* as the desired, and potentially available, object of contemplation and relation, the following expressible connection is described: Through *hitbonenut*, mystical contemplation, one proceeds from the isolated things of the 'olam ha-*nifradim* to the *Sefirot*, up to *hokhmah*, and from there to *mahshavah*, which is inseparable from 'Eyn Sof.<sup>48</sup> For all his restraint, that is, R. Isaac is here deconstructing and reconstructing the egress-regress spiral of the *Sefirot*, and their inherent ontic connection with 'Eyn Sof, in a form that is both intelligible and informative. A similar 'truth,' in poetic form, is likewise expressed in the following formulation from the *Keter Malkhut*:

Thou art the God of Gods, and the Lord of Lords,  
Ruler of beings celestial and terrestrial,  
For all creatures are Thy witnesses  
And by the glory of this Thy name, every creature is bound to Thy service  
Thou art God, and all things formed are Thy servants and worshippers  
Yet is not Thy glory diminished by reason of those that worship aught beside Thee,  
For the yearning of them all is to draw nigh Thee . . .

But Thy servants are as those walking clear-eyed in the straight path,  
 Turning neither to the right nor the left  
 Till they come to the court of the King's palace.  
 Thou art God, by Thy Godhead sustaining all that hath been formed,  
 And upholding in Thy unity all creatures.  
 Thou art God, and there is no distinction 'twixt  
 Thy Godhead and Thy Unity, Thy pre-existence and Thy existence,  
 For 'tis all one mystery.  
 And although the name of each be different,  
 "Yet they are all proceeding to one place."<sup>49</sup>

Ibn Gabirol, now through the tropes and magic of poetry, conveys the essential Neoplatonic piety, shared with R. Isaac: God and His creation are one. The *mekubbal* or philosopher may not know how the transcendental ontic interactions occur, but he does seem to know at least that they take place. And in knowing this he knows more of the "x of x's" than would at first seem possible given the systematic negations of Neoplatonic epistemology.

#### 4. Concluding on a Positive, if Paradoxical, Neoplatonic Note

Let me conclude by congratulating the Jewish Neoplatonists of all schools, mystical and philosophical, for their "inconsistency." They intuited, despite the intellectual fashions of their day, that the One of classical pagan Neoplatonism could not be the God of Israel. It might serve as a formal limit to an infinite regress, linguistic and otherwise, but it could not serve the religious and existential requirements of Jews and Judaism. To redeem the negations-of-negations that are Neoplatonism, to instill into these denials the breath of life and meaning, Jewish, Muslim and Christian Neoplatonists, like Plotinus himself in his more intuitive moments, sought, however contradictorily, to recreate the asymptotic approximation that a literal reading of Neoplatonic apophatic theory renders impossible. At the same time, they did learn the epistemic lesson that Neoplatonism teaches, that the God of Israel must always be more than we can say—although this does not require repeating the error of the Neoplatonists in supposing that we can say nothing of the Absolute. In the expressive phrase of the Kotzker Rebbe:

"Pfui, I am not interested in a God that any Tom, Dick or Harry can understand!"

## Self-Contraction of the Godhead in Kabbalistic Theology\*

David Novak

### 1. Kabbalah and Rabbinic Theology

In the mid-sixteenth century, when Kabbalah had already become a staple in Judaism, the leading Jewish legal authority in Egypt, Rabbi David ibn Abi Zimra (Radbaz, d. 1573), was asked whether there was any basis in the classical Jewish sources for the relatively new practice of putting on *tefillin* (phylacteries) at home and wearing them into the synagogue, as opposed to the usual practice then of wearing them only in the synagogue itself. He answered as follows:

One of the later sages wrote in the name of Rabbi Simon ben Yohai of blessed memory [traditional author of the *Zohar*] that since one must say when entering the synagogue, "I bow towards Your holy sanctuary in awe of You" (Psalms 5:8), if there are no *tefillin* on his head, where is the reverence? It is as if he were testifying falsely about himself. . . . Anywhere you find that the books of the Kabbalah

run counter to the ruling of the Talmud (*pesaq ha-gemara*), follow the Talmud and the codes. But anywhere it does not dispute them, as in this case, which is not mentioned either in the Talmud or in the codes, I have seen fit (*'ani ra'iti*) to rely on the words of the Kabbalah.<sup>1</sup>

This responsum epitomizes the deep inroads Kabbalah made into Rabbinic Judaism over the centuries. For Kabbalah presented itself as a deeper manifestation of Rabbinic Judaism, not as an innovation that might challenge it. In the case at hand, *tefillin* were worn, at least by scholars, outside the synagogue, certainly during the early Rabbinic period. The Kabbalistic practice, then, could be seen as a return to purer Rabbinic practice and higher piety. Kabbalah asserted its authority where the Rabbinic sources were silent or ambivalent, and by so doing deeper into common Jewish practice and belief than did the rationalistic theology of the medieval Jewish Neoplatonists and Aristotelians. It rarely presented its problematic in general philosophical terms, and was quite circumspect especially in exposing the influence of Neoplatonism on its development. As a result, for many Jews, Kabbalah was seen as a solely Jewish doctrine, indeed, as Judaism's most profound and original manifestation. In fact, one could argue convincingly that the waning of the hold of Rabbinic Judaism on the allegiance of modern Jews and the waning of the hold of Kabbalah on their imagination were almost simultaneous.

The important Kabbalistic doctrine of *zimzum*, what Gershom Scholem called *Selbstverschränkung Gottes*, "the self-contraction of God,"<sup>2</sup> has significant Rabbinic precedents upon which Kabbalah built. There may also be some affinity with Neoplatonic modes of addressing the problem of the One and the many, but I shall argue that the affinity is real only at one particular point in the development of this doctrine in the theology of Rabbi Isaac Luria (Ari, d. 1572). The main body of the doctrine, held by virtually all Kabbalistic thinkers was at odds with what Plotinus and his followers thought about the relation of the One and the many. This paper cannot cover all the various ways the doctrine of *zimzum* was enunciated in Kabbalistic literature. Rather, I shall try to represent a single synthetic theory of *zimzum*.

Rabbinic theology is much more loosely constructed than Rabbinic law. So here Kabbalah found significant openings for its

own doctrines. The most important issue for Rabbinic theology is God's giving the Torah to the Jewish people and their acceptance of it. And it was about the problem of revelation that the Kabbalists were most persistently concerned. The doctrine of *zimzum* plays a crucial role in the Kabbalistic metaphysics of revelation.

The earliest Rabbinic use of the term *zimzum* seems to be in a midrash about revelation as a relationship that involves active giving and active receiving:

You find that when the Holy-One-blessed-be-He gave the Torah to Israel, had He come to them with His full strength, they would have been unable to endure, as it says in Scripture, "If we continue to hear [the voice of the Lord our God anymore, we shall die]" (Deuteronomy 5:22). So He only came upon them according to their strength, as it says in Scripture, "the voice of the Lord in strength" (Psalms 29:4). It does not say "in His strength" (*be-kokho*), but "in strength" (*ba-koah*): according to the strength of each of them.<sup>3</sup>

In the Torah, Israel's inability to bear the voice of God in its full strength is addressed by the people's proposing Moses as their intermediary and God's acceptance of this compromise (Deuteronomy 5:24-25). But in the midrash, God limits His own power. Where Scripture invokes an intermediary external to God, the midrash perceives God's reflexive Self-confinement. The midrash develops this idea as follows:

When the Holy-One-blessed-be-He said to Moses, "make for Me a sanctuary" (Exodus 25:8), he was amazed and said, "The glory of the Holy-One-blessed-be-He fills the heavenly and earthly realms, yet He says 'make for Me a sanctuary'?!" . . . Said the Holy-One-blessed-be-He, "I do not think as you think . . . but I shall descend and contract (*ve'azamzem*) My presence (*Shekhinat*) within the cubits of the sanctuary."<sup>4</sup>

From this text and others like it, it can be inferred that there are two aspects of the divine life: One relates to what lies beneath it; the other transcends all relations.<sup>5</sup>

According to other midrashim, God's concentration and descent are needed because without His direct involvement the Jewish people

would inevitably misinterpret the Torah.<sup>6</sup> In effect, God has descended to the human level by giving the Torah as a human possession, binding Himself to what is now humanly interpreted and adjudicated law. As one seminal aggadah put it:

Rabbi Eleazar said that ordinarily (*be-noheg she-ba'olam*) a king of flesh and blood makes a decree (*gozer gezerah*), and if he wants to keep it he does; if not, it is kept by others. But with the Holy-One-blessed-be-He it is not so. Rather, He makes a decree and He Himself keeps it first. Thus it is written in Scripture, "Before the aged shall you rise and you shall honor the elderly, and you shall fear the Lord" (Leviticus 19:32). I am the One who first kept the commandment to stand before the aged.<sup>7</sup>

The Palestinian Talmud asks, "What is the basis of this? 'And they shall keep My charge (*mishmarti*); I am the Lord' (Leviticus 22:9), that is, I am He who kept the commandments of the Torah first."<sup>8</sup> This motif runs through Rabbinic literature from the tannaitic period on. A famous tannaitic aggadah expresses the point vividly:

Rabbi Eliezer said to them again, "If the law is according to my view, Heaven will so attest." A heavenly voice (*bat qol*) came forth and declared, "Why do you hold a position against that of Rabbi Eliezer? The law is according to him!" Rabbi Joshua rose to his feet and said, "It is not in heaven!" (Deuteronomy 30:12). . . . Rabbi Jeremiah said that the Torah was given at Mount Sinai already and we do not regard a heavenly voice as authoritative, for You already wrote at Mount Sinai, "Incline after the majority" (Exodus 23:2). It happened that Rabbi Nathan met Elijah. He said to him, "What did the Holy-One-blessed-be-He do at that time?" He said to him that He smiled and remarked, "My children have vanquished Me indeed (*nizhuni*)."<sup>9</sup>

All of this opened up the possibility for the subsequent metaphysical development of the theme of divine dependence on Israel by the Kabbalists.<sup>10</sup>

## 2. The Post-Rabbinic Problematic

From these representative texts it is clear that the rabbis regarded the price of active divine involvement in human affairs to be a bifurcation of divinity into a nonrelational priority and a relational posteriority. God, for them, was conceived as both *Deus absconditus* and *Deus revelatus*. God's accessibility is actively and freely initiated by God Himself and freely accepted by Israel. God's absolute oneness and absolute transcendence are thus modified by divine and human freedom. Plotinus addressed the corresponding problem in a radically different way:

So if there is a second after the One it must have come to be without the One moving at all, without any inclination or act of will (*oude boulethentos*) or any sort of activity on its part. How did it come to be, then, and what are we to think of as surrounding the One in its repose (*peri ekeino menon*)? It must be a radiation (*perilampsin*) from it while it remains unchanged, like the bright light of the sun which, so to speak, runs round it, springing from it continually while it remains unchanged. . . . If anything comes into being after it (*met' auto ginetai*), we must think it necessarily (*anankaion*) does so while the One remains continually turned towards itself.<sup>11</sup>

The contrast between these two views of the divine-human relationship can be seen best when the different verbs and prepositions used by the rabbis and Plotinus are contrasted. The rabbis use transitive verbs like "gave" (*natan*) and "came" (*ba*). They use prepositions like "to" and "for" (both expressed by the prefix *le*). The transitive verbs clearly indicate God's relational activity, which entails temporal succession. The prepositions suggest an active and free mutuality between God and His human creatures. Plotinus, on the other hand, denies that such prepositions pertain to the One: "Everything which is moved must have some end to which it moves (*pros ho kineitai*). The One has no such end, so we must not consider that it moves."<sup>12</sup> Here the key prepositions are "after" (*meta*) and "around" (*peri*). Such relations can involve no reciprocity or mutuality. The many *relate* themselves to the One; the One does not relate itself to the many. The many accept their lower ontological status (*meta*) and situate themselves in the orbit (*peri*) of the One, an

orbit compared to the splendor of the sun. The One, however, simply (*ex haplou*) remains (*menon*) as it has always been "because it seeks nothing (*to meden zetein*), has nothing and needs nothing."<sup>13</sup> Because there is no temporal succession, there is no active freedom; the One and the many have always been so related. Their relation could not be otherwise. Verbs suggesting temporality such as *ginetai*, "came to be," and *pepoieken*, "made," are used only metaphorically.

In view of the contrast between Rabbinic theology and Neoplatonic philosophy, one can see why Jewish thinkers of late antiquity and the Middle Ages, who were seriously committed to the cosmological paradigm of their pre-Galilean age, had a vexing problem with the actively relational God of Rabbinic theology and its closely connected theme of the primacy of *praxis* over *theoria*. The paradigm of Aristotle, Ptolemy and Plotinus regarded the heavens to be of superior substance and activity to anything beneath the moon. Circular orbit was deemed superior to locomotion, intransitive action superior to transitive action, *theoria* superior to *praxis*, and metaphysics superior to ethics.<sup>14</sup> To many Plotinus' model of the relationship of the One and the many looked a good deal more attractive than that of the Rabbis. Indeed, Plotinus claimed that his problematic was not born of his own particular vision, but was, as he put it, "the question repeatedly discussed also by the ancient philosophers, how from the One (*pos ex henos*) . . . anything else . . . came into existence (*hypostasias eschen*) . . . which we think it right to refer back to the One."<sup>15</sup>

Although the Kabbalists were immensely successful in concealing whatever philosophical sources they used in the construction of their own theology, it seems that they accepted the general problematic of Neoplatonism concerning the One and the many. But then they reinterpreted Judaism, not according to a Neoplatonic solution of this problem, as did most of the rationalist theologians, but as bearing a superior solution. The Kabbalists attempted this daring project through their development of the closely related doctrines of the divine multiplicity (*sefirot*) and divine self-contraction. The problem remains whether Rabbinic Judaism can bear the stretching of its categories this far. But the influence of Neoplatonism here is much less direct than it is in the openly philosophical approach of many of the rationalist theologians.

Capitulation to philosophy cannot readily be charged against Kabbalah. For the appropriation of Neoplatonic themes is covert, and the philosophic mode of argument and exposition remain external to the Kabbalistic texts. In fact, in the early days of its appearance, Kabbalah was not accused of being too philosophical but of resembling Christian trinitarianism.<sup>16</sup> Yet, unlike rationalistic theology, Kabbalah was adopted by many Rabbinic authorities. So the criticisms were mostly muted even at the beginning and gradually disappeared almost entirely. In the great controversy between the Hasidim and their opponents (*mitnagdim*) in the late eighteenth century, the two leading Rabbinic antagonists, Rabbi Elijah of Vilna and Rabbi Shneur Zalman of Liadi, were both Kabbalists.

If the Kabbalists accepted the general problematic of Neoplatonism, they had to deal with the following questions: (1) What is it within the Godhead (*'Elohut*) that makes possible for it an active relationship with finite beings? (2) Does the relational theology of Rabbinic Judaism seem to make God ultimately dependent on His human creatures? The irony is captured in the Talmudic phrase, "the native-born is on earth and the sojourner is in heaven?"<sup>17</sup> In other words, is not the proper hierarchy essentially reversed? (3) How can God be bound by (or even involved with) the commandments revealed to Israel in the Torah when most of them seem to address quite mundane issues? This concern parallels Parmenides' challenge to Plato's theory of Forms: "And are you undecided about certain other things, which you might think rather ridiculous (*geloia dokseien*), such as hair, mud, dirt, or anything else particularly vile and worthless? Would you say that there is an idea (*eidos*) of each of these . . . things . . . or not?"<sup>18</sup> Yet the Torah is concerned with the hair of the Nazirite (Numbers 6:18), the mud of an afflicted house (Leviticus 14:42), and even dirt, as in the ordeal of the Bitter Waters (Numbers 5:17).

### 3. The Foundation in the Zohar

It is often pointed out that the doctrine of *zimzum* as such is not found in the *Zohar*.<sup>19</sup> Yet one can see it as a logical development of the *Zohar's* doctrine of the *Sefirot*, the exfoliation of the Godhead

from solitary infinity ('Eyn Sof) to its ten supernal manifestations. The difference between the realm of the 'Eyn Sof and that of the *Sefirot* is pointedly expressed in this passage from the *Zohar*:

Behold in one word everything is connected, and that mystic word (*ve-raza de-millah*) is I AM ('*ehyeh*, Exodus 3:14). This includes all. When the highways are closed and are not spread out (*ve-la mitparshan*) but are together in one place, He is called I AM. Everything is sealed (*satim*) and not revealed ('*itgalayya*). But after the beginning (*shayruta*), when that river has been impregnated to draw everything forth, then He is called WHAT ('*asher*) I SHALL BE. This means, therefore ('*al ken*), I SHALL BE ('*ehyeh*). I will be prepared for the future (*zamim*) to draw forth and give birth to everything. I AM means, now (*hashia*) I am He who includes everything as an undifferentiated whole (*kellala*) without any parts (*perata*). WHAT I SHALL BE means that the 'mother' will be impregnated and be prepared for the future to bring forth all the particulars and to reveal the exalted Name.<sup>20</sup>

The *Zohar* finds a finitizing element in the word '*asher*'—'what.' This *what* marks the transition from absolute transcendence to transcendent relationality in God. The process of emanation ('*azilut*) is a preparation for the act of creation (*beri'ah*). For it is in creation that the relationality of God will find the objects which it intends and in which it will become immanent.

The distinction between *Deus absconditus* and *Deus revelatus* is especially clear in the following passage from the *Zohar*:

He (*hu*) is concealed and not revealed, for the Torah comes from the upper world (*me'alma 'ila'ah*) and in every place He is the upper world which is not revealed. . . . That is why He is called "He" and not "You" (*hu ve-la 'attah*). . . . Everywhere there are two worlds: that which is revealed and that which is concealed (*ve-da b'itikasya*). And we indeed declare God blessed in these two worlds, as it says in Scripture, "blessed be the Lord God of Israel from world to world" (*me'olam 'ad 'olam*, Psalms 106:48). For the upper world we call "He" and the lower world we call "You."<sup>21</sup>

This passage builds upon a peculiarity of Hebrew, especially the liturgical Hebrew of the rabbis. For a blessing (*berakhah*) begins in

the second person, as a direct address: "blessed are You, Lord" (*barukh 'attah, Ha-Shem*), but concludes in the third person, as an assertion, for example: "who has ('*asher*) given the true Torah to us."<sup>22</sup> On this peculiarity, it seems as though the author of the *Zohar* has built a major theological point: that the human response to God's blessedness intends both divine relationality and divine aseity. For it is clearly in the world of creation alone that God allows Himself to be addressed as "You," that is, He allows human creatures to be related to Him and thus brings Himself into a relationship with them.<sup>23</sup> But human worshippers must always be aware that God is never exhausted by this relationship.<sup>24</sup> Paul Tillich (d. 1965) analyzed the same theological question as it appears in the metaphysical thinking of the West, from which Kabbalah cannot be divorced:

Theological criticism of these attempts is easy if the concepts are taken in their proper sense, for then they make God finite, dependent on a fate or accident which is not himself. . . . But this is not the way in which these concepts should be interpreted. They point symbolically to a quality of divine life which is analogous to what appears as dynamics in the ontological structure. The divine creativity, God's participation in history, his outgoing character, are based on this dynamic element. It includes a "not-yet," which is, however, always balanced by an "already" within the divine life.<sup>25</sup>

Tillich's distinction between the "not-yet" and the "already" in the divine life can be useful, it seems to me, in analyzing the Kabbalistic distinction between God as 'Eyn Sof and God as *Sefirot*.

#### 4. Finitization and Freedom

Some Kabbalists saw a basic opposition between divine effusion (*hitpashtut*) and divine contraction (*zimzum*). But others saw the two as complementary aspects of the divine descent into relationality.<sup>26</sup> For any differentiation entails limitation. Such inner divine preparation for relationship with human creatures is described by the sixteenth-century Safed Kabbalist Rabbi Moses Cordovero:

Through ten utterances, that is, *sefirot*, was the world created. The Holy-One-blessed-be-He caused ten *sefirot* to emanate, and He combined within them the effusion of revelation (*shef'a gilluy*) of His splendor in the most complete unity (*bi-takhlū ha-yihud*) to create the world through them. By means of them [He created] all the worlds and the creatures which are limited and determined (*ba'alei gevul ve-takhlū*). And the ten *Sefirot* of emanation shine and are linked together (*u-mishtalshalot*) . . . for creation, formation (*yezirah*) and making (*'asayah*), through a mighty *zimzum*. For if between the Source-of-emanation-blessed-be-He and the world there were not the order (*sefer*) of the *Sefirot*, it would be impossible for the world, because of its lowliness (*pehituto*) to be led by the 'Eyn Sof.<sup>27</sup>

Here *zimzum* seems to take place not between the *Sefirot* and the 'Eyn Sof, but between the *Sefirot* and creation.<sup>28</sup> The *Sefirot* are not the result of a process of *zimzum* above them. Rather they themselves perform a process of *zimzum* in relation to what is beneath them, namely, the created world. But even here the differentiation and separation are already present in the process of emanation between the 'Eyn Sof and the *Sefirot*. Thus the early sixteenth-century Kabbalist Rabbi Meir ibn Gabbai spoke of the realm of the *Sefirot* as "the power (*ha-koah*) stored and sealed to go forth from potentiality to actuality (*'el ha-po'el*)."<sup>29</sup> If the actuality to be achieved is relationship, then a *zimzum* is present even before creation. For relationship presupposes the limitation of the ego.

In the theology of Rabbi Isaac Luria in sixteenth-century Safed *zimzum* was definitely seen within the Godhead itself. It was not just a condescension required for the process of emanation to lead into finite creation. Rather, it became the very foundation of emanation from the 'Eyn Sof into the ten *Sefirot*. Luria's disciple, Rabbi Hayyim Vital expressed his master's theory as follows:

The essence of this *zimzum* is to reveal the root of judgments, in order to place the attribute of divine judgment (*middat ha-din*) in the worlds. . . . And after this *zimzum*, it seems to me that there remains a vacant place (*meqom he-hallal*), an open and empty space within the light of the 'Eyn Sof itself. It seems to me that this indeed was originally (*kevar*) a place where the emanations, and the created beings, and the beings formed, and the beings made, exist.<sup>30</sup>

The primordial process of finitization was the making of vessels (*kelim*) to hold the diminished light of the emanations. "For in the beginning the light needed to be condensed (*zimzum*) and diminished (*ve-mi'uto*), and by means of this the existence of the vessel would be revealed . . . so that the vessel would be able to subsist and not be destroyed."<sup>31</sup>

For Kabbalists there is no real difference between creation and revelation. Creation is itself an act of revelation. It is not the bringing into existence of something really external to God, but rather God's making room within His own being for a greater diversity. In the theology of Luria and those who followed him, the "vessels" in which God's self-contraction allowed some of His light to be contained are seen primarily as the commandments (*mizvot*) of the Torah. God's ineffable Name is differentiated and finitized in the Torah as divine self-revelation. Thus God's binding Himself to the commandments of the Torah, as it were, does not entail a reduction of God to the control of humans or His confinement within the categories of our world. On the contrary, this binding is now an inner divine act prior to the creation of the world. Our keeping of the commandments with proper intention (*kavvanah*) elevates us as active participants in the inner divine drama. The commandments, despite their mundane phenomenality, are in truth symbols pointing to and participating in a transcendent reality. Here the Kabbalists revived the ancient Rabbinic interest in "the reasons of the commandments" (*ta'amei ha-mizvot*) with a powerful new impetus.<sup>32</sup> By introducing the doctrine of the ten *Sefirot* and the seemingly endless possibilities of relation among them, the Kabbalists multiplied without limit the possibilities for interpreting what the various commandments of the Torah truly intend.

The concern with the inner, spiritual meanings of the commandments is present in Kabbalah from its earliest manifestations. But Luria's theology focused appreciation of the commandments as acts of concentration and spiritual discipline by stressing their cosmic significance on the grandest scale. Rabbi Isaiah Ha-Levi Horowitz, a late sixteenth-century Safed Kabbalist who did much to spread Kabbalistic teachings among a wider mass of Jews, speaks about the significance of the commandments in the same vein:

And the Torah, which is light, subsists through knowledge of the reasons of the commandments and their inner mysteries (*ve-sodeihen*) . . . for the intention of the commandment (*kavvanat ha-mizvah*) is His mysterious Name, may He be exalted. For were it not for this, there would be no connection (*devequt*) of the material aspects of the act to spirituality (*le-ha-ruhaniyut*). . . . And it is evident in the *Zohar* and in the sages of the Truth [that is, Kabbalah] that from the material aspects of the commandment (*me-gashmiyut ha-mizvah*), the Torah and prayer . . . there is no taking hold of (*'ahizah*) and connection to the higher Garden of Eden . . . except through the intentions of the mystic knowledge of His names, may He be exalted.<sup>33</sup>

In the theology of the Hasidic masters, beginning in the eighteenth century, these Kabbalistic doctrines took hold of the imagination and devotion of the largest masses of Jews, those in Eastern Europe. The doctrine that the life of the commandments involves a real participation in the life of God gave an enormous incentive to increased observance and deeper piety. And the doctrine of *zimzum* developed by Luria and his immediate disciples played a key role in this explication of the commandments. We see this in a passage from the writings of one of the most important of the first generation of Hasidic masters in eighteenth-century Poland, the Maggid of Mezeritch:

What it means is that the Holy-One-blessed-be-He contracts Himself and makes Himself manifest (*shoreh*) in this world by means of the Torah and the commandments, which are here in contracted form (*be-zimzum*) and subject to various limiting conditions (*she'urin*). . . . Just as a father who loves his son even though very far from him, concentrates his mind and imagines as though his son's image stood before him, so, as it were (*ki-ve-yakhol*), the Holy-One-blessed-be-He contracts Himself.<sup>34</sup>

By insisting that God, the *'Eyn Sof*, transcends all particularity yet relates Himself to all things through the *Sefirot*, the Kabbalists preserve the Scriptural and Rabbinic theme that all God's acts are freely performed. God's self-contraction to make room for multiplicity is a free act. The relative non-being of *zimzum* is not something eternally existent like Aristotle's relative non-being (*me on*), which is potentiality (*dynamis*) in relation to actual being (*to*

*on*).<sup>35</sup> Both the relative non-being of *zimzum* and the actual being of creatures (*nivra'im*) are the results of God's free will. Vital (presumably following Luria, his teacher) does assert that it was "necessary" (*mukhray*) for God to bring His potential goodness into actuality by creating the world. But he also asserts that this is an act of God's will (*ke-she'alah bi-rezono*). Hence one might say that although God has a compulsion to give forth of His plenitude, it is still His choice *how* and *when* to exercise it. But it must be admitted that Luria and his school, of all the Kabbalists, came closest to the Neoplatonists in their metaphysical qualification of God's freedom.

The Kabbalistic continuation of the classical Jewish doctrine of God's absolute freedom sustains a corresponding doctrine of human freedom of choice. Where Luria saw God as limiting His omnipotence to make *space* for created being, later Kabbalists saw God as limiting His omniscience as well. The eighteenth-century Kabbalist Rabbi Hayyim ibn Attar saw this as a *temporal* limit. For human freedom is the capacity to act into an open future. That future cannot be known in advance, even by God, or it would not be the future—it could not be other than it *already* is known to be. Knowledge follows its object; it does not produce it. Even God can know objects only *after* He has created them. The doctrine of human freedom assumes that God does not create human actions *before* we actually perform them; therefore, even God cannot know them in advance. Present knowledge presupposes an existing object. So the future as such cannot be an object at all. Having no presence/existence (*mezi'ut*, "foundedness") the future *cannot be found*. Thus it is determined by action, not vice-versa.

At this level there seems to be an antinomy between divine omniscience and divine freedom.<sup>36</sup> With their new metaphysical doctrine of *zimzum*, the post-Lurianic Kabbalists had a way out of the apparent antinomy of human freedom versus divine omniscience.<sup>37</sup> It is not that God cannot know the future; rather, God wills not to know the future—so as to allow human freedom, lest the open future collapse into an "eternal now." As Ibn Attar writes:

For I inform you that the Lord is able to cancel (*lishlol*) knowledge that His intellect apprehends, that is, not to know it, when the Lord so wills. Human beings do not have the capacity to do this. . . . Now we can say that at the time of the creation of human beings,

the Lord canceled from His knowledge the [future] sins of man . . . so that the contention of the wicked would have no basis, when they say that God's knowledge necessitates (*makhrahat*) that what it knows will be—Since He already knew that this person would sin as he did, it was necessary (*yithayyev*) that it be so.<sup>38</sup>

Although Ibn Attar uses the term *shellilah* (cancellation) rather than the Lurianic term *zimzum*, *shellilah* is the temporal equivalent of spatial *zimzum*. God limits His power for the sake of creation, especially of human beings, and He limits His knowledge for the sake of human freedom. Divine freedom and human freedom are not just posited, they are correlated in a nexus of complementarity within the Kabbalists' metaphysical articulation and elaboration of Scriptural and Rabbinic themes.

A problem remains in Ibn Attar's formula. Literally, he states that God *had* omniscience and *then* canceled it for the sake of human freedom and responsibility. How does anyone choose to *not-know* what he had previously known? If what is known must be existent, even if the knower chooses to forget the object of knowledge, that object does not cease to exist just because it was forgotten. Even to posit that God's knowledge is *praxis* and not *theoria*, treating it as knowledge *before* the act rather than after it,<sup>39</sup> would not solve Ibn Attar's problem. For such *practical* knowledge can only be that of the actor. For God to have such *practical* knowledge of human acts would require that He, not man, be their author. God's omniscience as theoretical knowledge eliminates the futurity which human freedom presupposes; it makes what must be essentially future past. But God's omniscience as practical knowledge even more directly eliminates human freedom by denying that man is the author of *his own* acts.

I can only suggest the following solution to Ibn Attar's difficulty. One cannot assume that God was omniscient, then created the world, and then chose not to be omniscient about it. But one can say that God chose not to be omniscient *before* He created man in order for man to have the authorship of his own acts and the open future required by freedom and responsibility. In terms of *zimzum*, this would mean that God chose to cancel potential rather than actual knowledge of human action. Power rather than actual deeds is what can be restrained in advance.

### 5. *Zimzum* and Platonic Teleology

I have attempted to show that the Kabbalistic doctrine of *zimzum*, although sharing in the general Neoplatonic problematic of the One and the many, expresses Scriptural and Rabbinic doctrines of divine and human freedom and God's relation to creation. These distinctive Jewish doctrines are at variance with what Plotinus taught. They imply that God's covenantal relationship with His creatures is a good, not a detriment to be overcome or an embarrassment to be explained away. The initial concern is with God's relation to His creatures and, then, correspondingly, with how this relation enables creatures to relate themselves back to God. For Plotinus the ultimate end of this relationship is that it be overcome, that relationality lead to identity, and the many become absorbed into the One. He says:

The One is all things and not a single one of them: it is the principle (*arche*) of all things, not all things, but all things have that other kind of transcendent existence (*ekeinos*); for in a way they do occur in the One (*hoion endrame*); or rather they are not there yet (*oupo estin*), but they will be (*estai*).<sup>40</sup>

For Plotinus, all things do not come from the One in the sense that the One created them. Rather, "a great multiplicity flowed from it as that which is seen to exist in beings, but which we think it right to refer back to the One (*anagein de auto pros ekeino*)."<sup>41</sup> All things are related *to* the One in the sense that they do not truly exist and cannot be understood outside this relation. But the One is not itself related *to* all things in that way at all. It does exist apart from them and in no way requires their existence. The relation is wholly nonreciprocal; there is no genuine interaction between the parties: One side is solely absolute and the other solely contingent. We see much the same in Plato. In the *Timaeus*, the Demiurge creates the cosmos in order to relate unintelligible matter to the intelligible Forms. But the Forms, not the Demiurge, are ultimate reality, and they do not relate themselves actively or reciprocally to anything beneath them.<sup>42</sup> The same can be said of the God of Aristotle, who is not an efficient cause in the Aristotelian scheme.<sup>43</sup>

Some Kabbalists seem to have accepted this Platonic-Aristotelian-Plotinian teleology. They asserted that the purpose of all

human striving is the overcoming of multiplicity and limitation. For Rabbi Hayyim Vital, Luria's chief disciple, the ultimate purpose of all human striving, through the commandments properly intended, is the return of human souls to their pre-*zimzum* union with God.<sup>44</sup> But acceptance of this teleology poses a severe problem for Jewish theologians. For if God created finite multiplicity, why is it His and our goal to overcome it? Did God make a cosmic mistake? Is creation not really good after all, as the Gnostics maintained? Why should God have created it in the first place? Subordinating present relationality to future unification seems to negate the original goodness of God's act of creation and to cancel the worth of created beings.<sup>45</sup> If creation is good, why should it be returned to its source? If creation is to be overcome, why create at all? Why should God have not left everything in its primordial unity? The challenge of Gnosticism is particularly telling for the Neoplatonism of Jews, Christians or Muslims, since their traditional theologies affirm *creatio ex nihilo*. When Kabbalah comes to share the same teleology, which animates so much of medieval theology, more theological problems arise than are solved. It is the demand for a return to pristine unity, I would argue, whether in Kabbalah or in the rationalist theology it attempted to surpass, that must now be set aside or bracketed as a failed experiment.<sup>46</sup> Once this is done, perhaps Kabbalah can be returned to its own true origins as a development of the tradition of Scripture and the rabbis.<sup>47</sup>

### Notes

1. *Responsa Radbaz* (Warsaw, 1882), 4, #1111. Cf. #1151. In #1315 Radbaz calls this the practice of "the sages of Safed," the great center of Kabbalah in his time. I have been unable to find the exact statement in any of the writings ascribed to R. Simon bar Yohai, but the practice seems to be implied in *Zohar*: *Shelah*, 3:175b. See also, R. Moses Isserles, *Darkhei Mosheh* on *Tur*: 'Orah Hayyim, 25, #2, quoting R. Menahem Recanti's *Commentary on the Torah*: *Shelah*, end; R. Abraham Gumbiner, *Magen 'Avraham* on *Shulhan 'Arukh*: 'Orah Hayyim, 25.1, referring to the practice of R. Isaac Luria (Ari). For the Rabbinic practice of scholars wearing *tefillin* all day, see B. Megillah 28a; Maimonides, *Hilkhot Tefillin*, 4.25 and R. Joseph Karo, *Kesef Mishneh* ad loc. The usual reasons given for now wearing

*tefillin* only during weekday morning prayers are as follows: the need for great bodily cleanliness precludes their continual wear by most people (B. Shabbat 49a); *tefillin* were worn by certain charlatans to trick people into believing that they were pious and honest (ibid., Tos., s.v. *k'Elisha*); when wearing *tefillin* one's mind was not to be distracted from their sanctity (R. Nissin Gerondi, *Ran* on *Alfasi*: Shabbat, ch. 4, ed. Vilna, 22b, s.v. *garsinan* and *u-me-d'amar*, quoting B. Sukkah 26ab; *Tur*: 'Orah Hayyim, 37, and R. Joseph Karo, *Bet Yosef* ad loc. Cf. B. Berakhot 30b. Louis Ginzberg in his *Payrushim ve-Hiddushim Bi-Yerushalmi* on Y. Berakhot 2.3/4d (New York: Jewish Theological Seminary of America, 1941) 1.257-63 suggests very plausibly that the practice ceased to be so public because of Jewish fears of Roman persecution. For later halakhic considerations, see R. Obadiah Yosef, *Yabi'a 'Omer* 1, #36, sec. 15 (Jerusalem: n.p., 1954) 1.127; Jacob Katz, *Halakhah ve-Kabbalah* (Jerusalem: Magnes Press, 1984).

30. 'Ez Hayyim (Jerusalem: n.p., 1910) 1.11b. See S. A. Horodetzki, *Torat ha-Kabbalah shel 'Ari ve-Rabbi Hayyim Vital* (Tel Aviv: Ha-Hevrah le-Mif'alay ha-Sifrut, 1947), 35 ff.; Adin Steinsaltz, *The Thirteen Petalled Rose*, tr., Y. Hanegbi (New York: Basic Books, 1980), 21-24.
31. 'Ez Hayyim 1.13a.
32. A whole Kabbalistic literature developed on this subject, one of the most popular books in it being R. Menahem Recanti's *Ta'amei ha-Mizvot* (Basel, 1580). An early and seminal version of this new interest is found in Nahmanides (d. 1267), an important precursor of the *Zohar* and subsequent Kabbalah. See, e.g., his comment on Exodus 29:46.
33. *Shenei Luhot ha-Berit* (Jerusalem: n.p., 1963), 2b.
34. *Maggid Devarav le-Ya'aqov* (Satmar: n.p., 1905), 26, 29.
35. See Aristotle, *Metaphysics* 1089a 25.
36. 'Ez Hayyim 1.5a, 11a. See Horowitz, *Shenei Luhot ha-Berit* 14a; Scholem, "Schöpfung aus Nichts und Selbstverschränkung Gottes" 100, 117. For the history of this basic issue in Western philosophy, see A. O. Lovejoy, *The Great Chain of Being* (Cambridge: Harvard University Press, 1936), 48 ff.
37. The tendency to present divine omniscience and human freedom as forming an antinomy is seen as early as M. Avot 3.18 (see Maimonides ad loc.). It was later expressed most explicitly by Maimonides in his *Commentary on the Mishnah*: "Eight Chapters," 8, end, ed., Kafah (Jerusalem: Mosad Ha-Rav Kook, 1965) 2.265-66; *Hilkhot Teshuvah* 6.5; *Guide* III 20. Cf. L. E. Goodman, "Determinism and Freedom in Spinoza, Maimonides, Aristotle."
38. 'Or Hayyim ad Gen. 6:5. In medieval Jewish philosophy, *shellilah* has a stronger negative force than Ibn Attar gives it here: It has the force of absolute negation (*ouk on*; see Aristotle, *Metaphysics* 1089a 15-30). See Maimonides, *Guide* I 58.
39. Cf. David Burrell's paper in this volume.

40. *Enneads* V 2.1, 5.58-59.
41. *Enneads* V 1.6, 5.28-29.
42. See *Timaeus*, 29E ff.; D. Novak, *Suicide and Morality* (New York: Scholars Press, 1975), 33-35.
43. See *Metaphysics* 1072a 25 ff.; W. D. Ross, *Aristotle* (New York: Meridian, 1959), 177 ff. Cf. Henri Bergson, *Creative Evolution*, tr., A. Mitchell (New York: Random House, 1944), 350-53.
44. See 'Ez Hayyim 2.66b; also, Gershom Scholem, *Sabbatai Sevi*, tr., Werblowsky, 15 ff.
45. In Scriptural-Rabbinic anthropology, the human person is essentially mortal (see 1 Chronicles 29:15), whereas rationalist and Kabbalistic anthropology assign the soul a potentiality for immortality. Death is real and an inherent liability in created goodness (see *Bereshit Rabbah* 9.5 ad Genesis 1:31). Even the Rabbinic doctrine of the resurrection does not imply any human potential for immortality. We do not return to some infinite divine origin. Being embodied, the human person has no such potentiality; see Genesis 3:19. Rather, resurrection manifests God's grace (*Targum Yerushalmi* ad Genesis 30:22; B. Berakhot 34b ad Isaiah 64:3; B. Ta'anit 2ab; B. Sanhedrin 91b ad Deuteronomy 32:39). The life of the world-to-come portends God's power even over death, not man's.
46. For modern Jewish attempts to interpret *zimzum* more psychologically than metaphysically, see Joseph B. Soloveitchik, "The Community," *Tradition* 17 (1978): 15; M. Rotenberg, *Dialogue with Deviance: The Hasidic Ethic and the Theory of Social Contraction* (Philadelphia: Jewish Publication Society, 1983), esp. 8-16.
47. For a contemporary philosophical argument that divine contraction and divine creativity entail each other, see Robert Neville, *God the Creator* (Chicago: University of Chicago Press, 1968), 83.

## Jewish Kabbalah and Platonism in the Middle Ages and Renaissance

Moshe Idel

### I. Plato in the Kabbalah: An Overview

At the end of the twelfth century Jewish thought underwent several radical changes. The regnant Neoplatonism expressed in the work of such philosophers as Isaac Israeli, Solomon ibn Gabirol, and, in a less explicit manner, Moses and Abraham ibn Ezra and Abraham bar Hiyya, lost its dominance in favor of more Aristotelian ways of thinking like that of Maimonides and Abraham ibn Daud. Later European Jewish philosophy progressed under the aegis of Maimonidean Aristotelianism. But concomitantly with Maimonides' floruit, another speculative trend in Jewish thought began its career as a historical factor, the Provençal Kabbalah. In Provence, the stronghold of this incipient movement, the *Guide of the Perplexed* was translated into Hebrew and began to exercise its impressive influence over Europe. But the nascent Kabbalah was simultaneously emphasizing the Platonic elements in medieval philosophic texts, holding the Maimonidean version of Aristotelianism religiously suspect. The fiery controversy around the Maimonidean writings in Provence and Spain centered on non-philosophical, Halakhic and theological issues.<sup>1</sup> But a need was clearly felt for an alternative to Maimonidean Aristotelianism, and the main, indeed unique,

speculative alternative in the environment of the Maimonidean controversy in Europe was the early Kabbalah, a fountainhead of Neoplatonic concepts, imagery, and mystical cum mythical speculations.<sup>2</sup> The early Kabbalists welcomed ideas explicitly rejected by Maimonides, but even exploited the *Guide* itself to lend credence to a Platonic view actively combatted by Maimonides. R. Ya'akov ben Sheshet, a Catalan Kabbalist, wrote:

God was contemplating the Torah<sup>3</sup> and saw the essences (*havvayot*)<sup>4</sup> in Himself, since the essences were in Wisdom (*Hokhmah*) and discerned that they are prone to reveal themselves. This tradition I heard in the name of R. Isaac son of R. Abraham, of blessed memory.<sup>5</sup> And this was also the opinion of the Rabbi [Moses Maimonides], the author of [*The Book of*] *Knowledge*, who said that He, in knowing Himself, knows all existent creatures.<sup>6</sup> Yet the Rabbi was astonished in Part II, ch. 6 of the *Guide*, at the dictum of our Sages that God does not do anything before He contemplates His retinue (*Pamalia*), and he quoted there the dictum of Plato, that God, blessed be He, does contemplate the intellectual world and causes to emanate therefrom the emanation [which produces] reality.<sup>7</sup>

The Kabbalist here juxtaposes two discussions of Maimonides: in the *Mishneh Torah* the author presents his view, stemming ultimately from Themistius, about God containing the forms of all existents and thus knowing them by way of self-knowledge;<sup>8</sup> discussing a different issue in the *Guide*, Maimonides sharply opposes a simplistic interpretation of the Midrashic dictum that God created the world by contemplating the Torah as the blueprint of reality. To the Kabbalist the two views seem to be equivalent. Thus his surprise at Maimonides' inconsistency in accepting the first while rejecting the second. Since the position of R. Isaac the Blind, cited before Maimonides' views, must be the truth for Ben Sheshet, Maimonides' critique is implicitly rejected, and the Platonic view mentioned in the *Guide* is deemed correct. R. Ezra of Gerona was similarly anxious about "misinterpretation" of Maimonides' Midrashic view.<sup>9</sup> The Ben Sheshet passage, to which we shall return, illustrates the eagerness of the Kabbalists to exploit the hierarchical structure of Neoplatonism in mediating between the divine and the lower realms.

The Aristotelian transcendent theology of Maimonides is unwelcome in view of these motivations.

Concurrently with the rise of the early Kabbalah, Neoplatonic themes were exerting their influence on the mystical movement that developed in Ashkenazi esoteric theology, although penetrating through channels that escape modern scholarship.<sup>10</sup> The geographic areas of the two centers of Jewish learning in which Neoplatonism reverberates are not remote from each other. Perhaps some influences penetrated before the Ashkenazi and Provençal types of Jewish mysticism went their separate ways.<sup>11</sup> But the two movements independently underwent further Neoplatonic influences.

As Maimonidean thinking spread in Spain, fears about its implications fostered a more negative attitude toward Maimonides and his source, Aristotle. From the thirteenth century examples can be collected in which Aristotelian views adopted in the *Guide* were criticized obliquely, attributed only to Aristotle or to Maimonists like Samuel ibn Tibbon.<sup>12</sup> If Epicurus was the *bête noire* of the ancient sages, conservative medieval Jews conceived of Aristotle as the root of theological errors. This image of the Stagirite opened the way for the positive reception of Plato. At the beginning of the fourteenth century we find an adaptation of a legend dealing with the history of Greek medicine,<sup>13</sup> in which the Italian Kabbalist R. Menahem Recanati inserts the name of Aristotle:

There are several testimonies as to persons burned by the "path of the turning sword," and all of them were masters of the ancient philosophy. Most of their sayings were close to those of our sages, of blessed memory. And since then [the burning] they disappeared, and Aristotle came with his wicked disciples, and deviated completely from the way of the Torah, following their own speculations and demonstrations, which the masters of Kabbalah recognized as illusory (*ahizat 'eynayyim*).<sup>14</sup>

The ancient philosophers are anonymous and forgotten; the watershed is Aristotle, who is responsible for the ruin of knowledge.

By the end of the first third of the fifteenth century, Greek philosophy was epitomized among the Kabbalists in a manner highly sympathetic to Plato:

The views of the ancient philosophers like Plato seem to be close to the views of the Torah, but those who came later did not understand his thinking. For they were as insignificant as the heretics of our nation.<sup>15</sup>

Like his fourteenth-century predecessor Menahem Recanati, R. Shem Tov ben Shem Tov, who formulated this admiring view of Plato, was clearly anti-Aristotelian. He relates that he became acquainted with Plato through followers of Aristotle,<sup>16</sup> whose views diverge from Plato's. But Plato's thought was seen as consonant with Jewish piety, not through a profound study of the Platonic corpus (which was unavailable to Jews in the West, as it was to their Christian contemporaries), but precisely because Plato's works (unlike those of Aristotle) were inaccessible and therefore, according to R. Shem Tov, could not possibly have influenced Kabbalistic thought. From an anonymous hand in the generation of the Expulsion from Spain, we read:

those books [the *Sefer Yezirah* and *Sefer Enoch*] in their entirety fell into the hands of the Greeks, who took them from the academy of Solomon in Jerusalem. And the sayings of the early Greeks, up to Plato, were almost religious views, taken from there. In vain did they attribute every science and tradition to their own investigations. In fact they found them written in these books. Then came Aristotle and his companions and they plagiarized them in their flattering language, and all the world followed them.

Aristotle was seen by R. Shem Tov and by the anonymous author just quoted as the source of a pernicious shift in Greek thought: The ancient Greek sages held views close to those of the Torah, and Plato is the paragon of sound theology.

With the coming of the Renaissance and the translation of the bulk of the Platonic and Neoplatonic corpus, Platonic philosophy became a live option for the elite. Christians and Jews alike could now enjoy the writings of the ancient philosopher, who moved to the center of intellectual life in many circles all over Europe. The impact of this Platonic revolution shaped European thought for more than a century, but Jewish intellectuals in close contact with the Florentine thinkers were the chief catalysts. The main body of Jewish thought

underwent only a tangential influence from the luxuriant growth of Neoplatonic literature now available in Latin or Italian. Steeped in the medieval Aristotelianism that was already constitutive to the speculative patrimony of Judaism, most philosophically inclined Jews remained relatively indifferent to the disclosure of the authentic Plato. The Neoplatonic corpus translated by Marsilio Ficino remained untranslated into Hebrew. In a period when Jews were key translators of Aristotelian material into Latin, as with the translations of Eliahu del Medigo, Abraham de Balmes, and Jacob Mantino, the Jewish elite were only rarely interested in the Neoplatonic trend of thought that was expanding its influence among Christian intellectuals.

But at the close of the fifteenth century the pejorative mentions of Platonism common among Jewish Aristotelians gave way to much more positive attitudes. R. Yehudah Messer Leon, a committed Aristotelian, compared Platonism contemptuously to Kabbalah. But his son was interested in Kabbalah and described Plato as the divine master, just as his Christian contemporaries did.<sup>17</sup> The number of printed quotations by Jews from the Latin Platonic corpus in the last quarter of the fifteenth century is minuscule. But there was another type of influence of Ficino's translations: If direct quotations from the Latin are rare, the interest in medieval Jewish and Arabic Neoplatonism was incomparably greater, and was paralleled and supported by heightened interest in the Kabbalah.<sup>18</sup> Derided by the Aristotelian intellectual establishment of the fifteenth century, the Kabbalah gradually became the center of Jewish culture. The same trend is evident in Christian thought in Florence, where the deep interest in Neoplatonism was coupled with the introduction of Kabbalah as an exotic graft onto Christian theology. The Christian interest marks a sharp departure from medieval reticence about pagan philosophy and magic on the one hand and Jewish mysticism on the other.<sup>19</sup> Among Jews the renewed interest in the Neoplatonic legacy is a return to the medieval tradition, at least partially motivated by the Christian rediscovery of Platonic thought.

Why the slight response, then, to the translations of Ficino? Jews active in Florence, close to the circle of Ludovico de Medici, deliberately refrained from immersing themselves in the new world cultivated by their neighbors. Apparently, late fifteenth-century Jews retained a certain medieval selectivity about the sources they would

quote explicitly. They openly cite the Arabic authors, who provide the problematic and background of medieval Jewish philosophy. But they tend not to mention Christian philosophy, even when it influences them. This hypothesis was proposed by Shlomo Pines in discussing the use or abuse of scholastic thought by medieval Jewish thinkers, and mooted again in the case of Leone Ebreo,<sup>20</sup> to whom we shall return. I propose to expand this point to the relationship of Renaissance Jewish thinkers in general to the Platonic, Neoplatonic and Hermetic literatures and the related writings of Pico and Ficino. The material quoted explicitly may be rare, but the impact of the intellectual movement is profound. Rather than focus only on explicit materials, I propose to work inductively to assay the influence of Christian thought on Jews in the first stages of the Renaissance.

Strangely enough, Plato, the philosopher who for some medieval Kabbalists seemed closest to the Jewish religion, became suspect in the eyes of most of the Renaissance Jews who could benefit from study of his works. Evidently he was much more welcome as a legendary representative of lost Greek lore than as a philosopher to be openly cultivated. But an important exception is the famous *Dialoghi d'Amore* of Leone Ebreo, the key exponent of Renaissance Jewish Neoplatonism, whose influence on the Renaissance in general was wide and profound. More than any other Jewish thinker Leone Ebreo profited from Renaissance Christian Neoplatonism.<sup>21</sup> So consideration of his response to Plato may contribute to a more nuanced description of Jewish Renaissance Neoplatonism. Pines emphasizes the medieval Arabic philosophical sources of the theory of love enunciated by Ebreo, and I have suggested another possible Arabic source.<sup>22</sup> I find much less openness to the Christian Neoplatonists than is often supposed, and Arthur Lesley has come to similar conclusions.<sup>23</sup> Ebreo knew Florentine Neoplatonism but did not consider it the apex of philosophy, and, as I shall show elsewhere, he criticized Ficino's handling of some Platonic issues. Following medieval Jewish sources, Ebreo saw Plato as dependent on Mosaic revelation and even as a disciple of the ancient Kabbalists; Aristotle was a disciple of Plato who did not understand clearly all that his mentor had learned from his Jewish masters.<sup>24</sup> The story is reminiscent of Kabbalistic treatments.

With the establishment of Neoplatonism as a major focus of

European thought, from the beginning of the sixteenth century, its influence on the interpretation of Jewish Kabbalah becomes more and more visible. By the end of the sixteenth century and the beginning of the seventeenth, Neoplatonic speculations dominate the thinking of many Italian and other European Kabbalists, eager to quote substantially from Platonic and Neoplatonic sources, ancient, medieval and contemporary.<sup>25</sup> Let me explore one point of impact of Neoplatonic thought on Kabbalah during the medieval and Renaissance periods.

## II. The *Sefirot* and Hebrew Letters as Neoplatonic Ideas

### A. Neoplatonic Influences in the Early Kabbalah

A key source of Kabbalistic theosophy and cosmology is the short treatise known as the *Sefer Yezirah*. Tantalizing its many commentators for centuries, the work remains an enigma for modern scholarship. At the very beginning of the work Kabbalists found reference to two basic elements necessary to the creation of the world: the ten *Sefirot*, originally ten mythic numbers, and the twenty-two letters of the Hebrew alphabet. According to the medieval Kabbalists, these elements are important not only as instruments of the act of creation, but also, perhaps especially, in constituting the Kabbalistic *Deus revelatus*, God revealed as and through the *pleroma* of the ten *Sefirot*. The mystic numbers preceded creation and were crucial not only to the world's emergence but also to its continued existence. In the early Kabbalah the *Sefirot* and letters were active forces appointed over the universe and susceptible to influence by human activity. The events of their dynamic formed the life of God.<sup>26</sup> The history of Kabbalistic theosophy is to some extent the history of various understandings of the *Sefirot* and the letters. The fortunes of the *Sefirot* are an index of the growth of Neoplatonism in the Kabbalah.<sup>27</sup>

The view of R. Isaac the Blind cited by Ben Sheshet affirms the existence of all essences in the second *Sefirah*, *Hokhmah*, which plays the role of the divine intellect and thus comprises the world of ideas. The same Provençal master is quoted elsewhere by Ben

Sheshet about the nature of the *havvayot*: "The beginning (*hathalar*) of the *havvayot* is one."<sup>28</sup> 'Beginning' here points to the first *Sefirah*, referred to by Ben Sheshet as a subtle and fine *havvayah*. Thus, passage from the first to the second *Sefirah* is passage from unity to multiplicity, although the multiplicity is realized fully as such only in the third *Sefirah*, *Binah*. Ben Sheshet thus places the essences or ideas in a container that is neither wholly "extradeical" nor wholly "intradeical." For the second *Sefirah* is identical with God's thought, yet distinct from the Highest phase of the divine, the 'Eyn Sof or Infinite. According to the Kabbalist, Maimonides is perfectly right to agree that God contemplates all things by an act of Self-knowing. But the "great eagle" was wrong to oppose the recognition of a certain distance between the contemplator and the realm of the ideas.<sup>29</sup>

Ben Sheshet's conception of the second *Sefirah* as the container of the essences is part of a broader Neoplatonic scheme. Explaining the word 'Ayn, nothingness, he writes:

*Alef* points to the Will, which [reaches] the 'Eyn Sof. . . . *Yod* points to *Hokhmah* . . . and the *Nun*, to the emergence of things from *Hokhmah*.<sup>30</sup>

So the divine will is the starting point of emanation, the *alpha* of the whole process of expansion in the divine world; it is identical to the first *Sefirah*. The *Yod*, pointing to *Hokhmah*, symbolizes the intellectual; the third letter refers to the multiplicity that emerges from the essences comprised in the second *Sefirah*. Although the text does not state it explicitly, the numerical value of the Hebrew letters hints at the emergence of multiplicity from unity: *Alef* (one) is unity; *Yod* (ten) is the decad of primary essences in *Hokhmah*, and *Nun* (fifty) stands for the full fledged multiplicity of the third *Sefirah*, *Binah*, traditionally connected to this number in a long series of texts. Ben Sheshet writes:

This is the statement of the philosopher who arranged four [things]: the Intellect, the Will, the spiritual (*ha-nafshi*), and the natural (*ha-tiv'i*). The Will is the divine will; under it is the Intellect, that is, the Active Intellect; under that, the Soul, i.e., the intellectual soul; under it, the natural. We see that *Alef* in our terms (*bi-*

*leshonenu*) corresponds to the divine Will in their terms, and *Yod* in our terms corresponds to the Active Intellect in theirs, etc.<sup>31</sup>

Thus the Kabbalist was aware of a philosophical position paralleling his own and quite like the Plotinian scheme of the Arabic Long Version of the *Theology of Aristotle*, with the divine will placed above *Nous*.<sup>32</sup> The scheme is reinterpreted in Kabbalistic terms, with Will as the first *Sefirah*, Intellect as the second, Soul apparently identified with the third, and Nature consigned to the lower *Sefirot*. This Kabbalist is well aware of the foreign source of the doctrine and acknowledges the difference in terminology but remains convinced that the concepts correspond. A similar view is found in Ben Sheshet's compatriot and contemporary R. Azriel:

The words of the wisdom of the Torah and the words of the aforementioned masters of investigation (*ba'alei ha-meqar*) are as one (*sheneihem ke'ahat*). Their way is one, and there is no difference between them but the terms alone, since the investigators did not know enough to give the proper name to every part.<sup>33</sup>

Only the Kabbalists, R. Azriel urges, who received traditions from the Prophets, know how to designate each entity appropriately. But the philosophers are not to be cast aside—at least not all of them. Aristotle and Plato approximated the wisdom of the Kabbalists.<sup>34</sup> The views quoted in their names are, of course, purely Neoplatonic and have little to do directly with the actual teaching of the two Greek philosophers.<sup>35</sup>

The stance of the two Geronese Kabbalists as to the congruence of Kabbalah and Neoplatonism is not found earlier. But a similar cosmology surfaces in the theosophy of R. Azriel. He too conceptualizes the *Sefirot* in a distinctly Plotinian manner. At the highest level is an Unseen or Invisible world ('*Olam ha-Ne'elam*'), paralleled in Ben Sheshet and elsewhere in Azriel, by the divine Will.<sup>36</sup> Next comes the Intellectual World ('*Olam ha-Muskal*'); then, the sensory ('*Olam ha-Murgash*'), paralleling the world of the Soul in the Plotinian scheme; and finally, the Natural World ('*Olam ha-Mutba'*').<sup>37</sup> In postulating the existence of all the worlds in the divine realm, these Kabbalists seem to intend the idea that all

perfections are contained in the divine and then displayed in the emanative process.

By identifying *Hokhmah* with the Universal or Active Intellect, Ben Sheshet is assuming that all the forms, or ideas, exist there. Yet he rejects the Neo-Aristotelian view of the Active Intellect as given charge over the sublunar world and places it on a higher level, as in the Plotinian cosmology. The second *Sefirah* is identical with the Torah and God's Throne, the essence of which is grasped intellectually.<sup>38</sup> Thus the second *Sefirah* is an intellectual entity, and a conscious one, the object of its thought being the *dimyonot*—visions, images, archetypes, or forms.<sup>39</sup> Here the last may be the best rendering: The divine intellect thinks the forms, much as the human mind does. In a passage reminiscent of Ben Sheshet, R. Azriel, explains:

The 32 wondrous paths of *Hokhmah* are the ten *Sefirot* of *Belimah* and the 22 letters. Each has its own distinctive path, and their beginning is the Will, which precedes everything. Nothing is outside it, and it is the cause of Thought (*Ma'hashavah*). The *Sefirot* and the paths, and all that will be created out of them in the future—everything—is hidden in the *Ma'hashavah* and revealed in its paths: in the paths of Speech (*Dibbur*) and the paths of Deed (*Ma'aseh*). 'He contemplates the Torah' means that He contemplated the *Ma'hashavah*—the paths included in it, and drew each one from the beginning . . . and in the forms (*dimyonei*) of that *Ma'hashavah* the words and deeds were prefigured (*niztayyru*), since the *Ma'hashavah* is the root.<sup>40</sup>

The pre-existence of the roots of speech and deeds in divine thought is compared by R. Azriel with the pre-existence of form and *hyle* in divine thought according to the Neoplatonic sources he quotes. But the philosophers deal only with entities; the Kabbalist is concerned as well with speech and deeds as dynamic processes comprehended in the *Ma'hashavah*. The verb *niztayyru* means both figured and imagined. The same root occurs again, along with the term *dimyon* in relation to deeds, in the work of another Geronese Kabbalist who might have known the work of R. Azriel, R. Moses ben Nahman, the famous Nahmanides:

Whatever occurred to the Fathers is a sign to the sons (Genesis Rabbah 40, 8). When Scripture expatiates on the story of their travels, the digging of wells, and other events, one may think it redundant or otiose, but all is there to teach of the future. For whenever something happens to a prophet or the three Patriarchs, he may understand from it what is predestined for his progeny. Know that every divine decision, wherever it turns from the potentiality of a decree into the actuality of a *dimyon*, will be fulfilled, regardless of the circumstances. . . . Thus God kept [Abraham] in the land [of Israel] and created for them *dimyonot* of whatever He purposed to do to his progeny.<sup>41</sup>

Here the destiny of the Patriarchs is linked to a *dimyon*, just as deeds were connected to a *dimyon* by R. Azriel. The root *z-y-r* is used again in a similar context in Nahmanides:

Scripture here concludes the Book of Genesis, which is the Book of Formation, concerning the creation of the world and all created things, and the events in the lives of the Fathers, which were formative for their progeny—for all their experiences are prefigurations (*ziyyurei devarim*) that hint and presage all that will come to pass in the future.<sup>42</sup>

Here, as in R. Azriel, everything is contained in the Torah, an assumption of which Ben Sheshet was especially fond.<sup>43</sup> Nahmanides does not elaborate on the relation between future events and the creation but leaves obscure just how the acts of the Fathers determine the fate of their progeny. Amos Funkenstein proposes that the Christian term *figura*, indicating the prefiguration of later events by earlier ones, is the basis of Nahmanides' *ziyyur*. He gives 'similitude' as the correct translation of *dimyon*.<sup>44</sup> But since the metaphysical background of Nahmanides' usage is corroborated in the discussions of his compatriots and contemporaries Rabbis Azriel and Ben Sheshet, I think we should understand his terms and views in the light of their discussions. The *Sefirah* of *Hokhmah*, or *Ma'hashavah* in Azriel's text, includes the forms not only of the things to be created but also of all future deeds and words. The specifically Kabbalistic conception of prefiguration would be underlyingly Neoplatonic, although the Neoplatonism is of a distinctive type. It involves not only the classical correspondence of terrestrial objects to ideas, but also the prefiguration of acts and utterances in the divine

intellect. Nahmanides supplies an example from the realm of deeds.

Turning to the realm of speech, we find that Ben Sheshet interpreted the *intellecta* of *Hokhmah* as the roots of the Hebrew letters:

*Hokhmah* emerges from the Nothingness (*me-'Ayn*),<sup>45</sup> and *Binah* from the *Alef*, and the *Alef* points to a subtle entity (*Havvayah daqqah*) out of which the *Hokhmah* comes into existence . . . it is the beginning of all the essences (*havvayot*) . . . the *Yod* points to the *Hokhmah*, which is the Beginning. . . . And out of the *Hokhmah*, the letters were emanated and engraved in the spirit of the *Binah*, and the essence of the letters is that they are the forms of all creatures, and there is no form which has not a likeness in the letters or in the combination of two or three of them or more.<sup>46</sup>

The Plotinian ideas are the essences of all things, existing in an intellectual container, the second *Sefirah* according to the Kabbalists, and are identical with the roots of the Hebrew letters. Moreover, these letters, as forms, have an important Neoplatonic characteristic: Following the view of R. Isaac the Blind, Ben Sheshet indicates that "each letter comprises all the others."<sup>47</sup> This formulation is reminiscent of the Proclean view applied to the Platonic ideas, that "all is in all."<sup>48</sup> The view of the letters as the ideas in *Hokhmah* harmonizes with the view, expressed several times in Ben Sheshet's writings, that identifies the second *Sefirah* with the Torah, which is in turn conceived as containing all the sciences.

R. Ya'akov ben Sheshet and R. Azriel of Gerona do not mention each other, but their work seems to be distinctive in the Geronese Kabbalah—distinct even from the thinking of R. Ezra of Gerona and Nahmanides. The latter were less interested in philosophy in general and in Neoplatonism in particular; they lack the fourfold cosmology and do not mention an affinity between philosophy and Kabbalah. Ben Sheshet need not have innovated these views, but the integration of the scheme may result from his work, perhaps together with that of R. Azriel. The view that *Hokhmah* includes the letters that contain each other can be reconstructed from the writings and fragments of R. Isaac the Blind. So we may assume that the Plotinian view of the second *Sefirah* and of language as a prototype was already present in the Provençal Kabbalah. A similar view is found in a text of R.

Asher ben David, nephew of R. Isaac the Blind: "for the power of one (*Sefirah*) is in the other, since each *middah* is contained in the other."<sup>49</sup> Thus it seems that the principle of Proclus is applied, at the very inception of the Kabbalah, not only to the letters but also to the *Sefirot*.

The affinity between Neoplatonic and Kabbalistic conceptions, then, reaches far beyond the residues of Neoplatonism found in the nascent Kabbalah. For we see it in the adaptation of philosophical terminology in the writings of at least two important Kabbalists. Both R. Azriel and Ben Sheshet were innovative authors who openly exposed Kabbalah, apparently for the first time, to an audience beyond that of immediate disciples.<sup>50</sup> Perhaps they were ready to acknowledge the correspondence between Kabbalistic and Neoplatonic concepts because of their commitment to propagating the Kabbalah. Again, an author who believed that an ancient philosopher acknowledged the same ontological structure as the Kabbalah may have been less inclined to keep to himself the previously esoteric doctrines. What was disclosed would not be wholly novel to his audience.<sup>51</sup> Thus the first author to mention the affinity between the Platonic ideas and the *Sefirot* was R. Yehudah Romano, an Italian thinker well acquainted with scholastic theology and so with the Platonic ideas.<sup>52</sup>

### B. Platonic Ideas and Renaissance Kabbalah

Faced with the more elaborate Platonic views presented in the translations of Ficino and his followers, the Kabbalists' response is less positive than that of R. Ya'akov and R. Azriel at the beginning of the thirteenth century. These compared one view of Plato, as quoted by Maimonides, with a central doctrine of the most important early Kabbalist, in the case of Ben Sheshet, or with the analogous treatments drawn from authentic Neoplatonic texts, in the case of R. Azriel, and they did so without disparagement of Plato. On the contrary, it was Maimonides who was criticized for resisting the Platonizing notion of archetypal essences in divine thought. R. Eliahu del Medigo, a late fifteenth-century Aristotelian who rejected both Platonism and Kabbalah, sees the Platonic background of Kabbalistic thinking as a detriment. His commentary on *De*

*Substantia Orbis* reports on the Kabbalistic doctrine of the *Sefirot* and concludes that, "These opinions were taken from the propositions of the early philosophers, particularly from Plato." On this basis, he questions the orthodoxy of Kabbalah and the legitimacy of its provenance as Jewish lore.<sup>53</sup> A more balanced appraisal is found in Isaac Abravanel:

For of necessity things exist as a figuration<sup>54</sup> in the mind of the agent before they come into being. Indubitably this image is the world of the *Sefirot* mentioned by the Kabbalistic sages of true wisdom, [who said] that the *Sefirot* are the divine figurations with which the world was created. Thus they said that the *Sefirot* are not created but emanated, and that all of them are united together in Him, blessed be His name, for they are the figurations of His loving-kindness and His willing what He created. In truth, Plato set down the doctrine of separate universal forms not as Aristotle understood them.<sup>55</sup>

The affinity between Plato's "separate universal forms" and the *sefirot* is presented without any historical claims. The similarity is simply observed. But Isaac Abravanel believed that Plato studied with Jeremiah in Egypt and received his knowledge from the prophet.<sup>56</sup>

As long as a Kabbalist could present Plato as a more venerable alternative to the pernicious doctrine of Aristotelianism, Plato served as a valuable foil, paralleling and in a way corroborating Kabbalistic themes. But when the Platonic corpus becomes a potential rival to traditional views, Jewish authors begin to stress not Plato's affinity to Kabbalah but his discipleship of a prophet. Rather than allow for two independent sources of knowledge, Mosaic and Greek, they preferred to see the truth and the highest insights as one, stemming ultimately from the Mosaic revelation, accepted by Plato, but distorted by Aristotle. Aristotelianism, in any case, was less influential among Renaissance Jews than among their medieval forebears, and so less threatening. R. Yohanan Alemanno, a companion of Pico della Mirandola, writes:

The ancients believed in the existence of ten spiritual numbers. . . . It seems that Plato thought that there are ten spiritual numbers of which one may speak, although one may not speak of the First Cause,

because of Its great concealment. However, [the numbers] approximate its existence so closely that we may call these effects by a name that cannot be ascribed to the movers of corporeal bodies. Indeed, in the opinion of the Kabbalists, one may say this of the *Sefirot*. . . . This is what Plato wrote in the work *Ha-'Azamim ha-'Elyonim*, as quoted by Zechariah in the book *Imrei Shefer*.<sup>57</sup> From this it follows that in Plato's view the first effects are called *Sefirot* because they may be numbered, unlike the First Cause, and therefore he did not call them movers.<sup>58</sup>

Alemanno here links the terms *Sefirot* and *Misparim*, numbers. Both were considered "separate," i.e., spiritual, beings, so he could assume that their apparent common root was no accident. The passage implies that "Plato" (sc., Proclus, in the *Liber de Causis*, quoted here in an otherwise unknown translation) presented a doctrine of disembodied numbers similar to the Kabbalistic *Sefirot*, and that he held these views independently. But elsewhere Alemanno repeats the view that Plato studied with Jeremiah.<sup>59</sup>

Alemanno is interested in the *Sefirot* mainly for cosmological reasons. In a roundnote of his in the margin of a quotation from the commentary of R. Yehudah Hayyat, a Spanish Kabbalist, on *Ma'arekhet ha-Elohut*, we read:

They said that the *Sefirot* are intermediary between the world of the eternal rest that is *'Eyn Sof*, and the world of motion, that is, the world of the spheres. This is why they are sometimes in a state of rest and sometimes in motion—as is the nature of the intermediary, composed as it is from the extremes.<sup>60</sup>

The Spanish Kabbalist copied by Alemanno held a dynamic view of the *Sefirot*, as linked to human activity and the fulfillment of the commandments. But Alemanno preferred to see the *Sefirot* as intermediary, their motion caused by their ontic status and not influenced by human acts.

In the works of R. Yehiel Nissim of Pisa, whose grandfather was Alemanno's patron, and whose uncle, R. Isaac of Pisa, was Alemanno's student, we find a similar stance, but with a peculiar emphasis:

The upper creatures are a model for the lower. For every lower thing has a superior power, from which it came into existence. This resembles the relationship of the shadow to the object that casts it. . . . Even the ancient philosophers such as Pythagoras and Plato taught and expounded about this. But the matter was not revealed to them clearly; they walked in darkness and attained but did not attain (*noge'a ve'eino noge'a*), since the universals and the forms indicated by Plato only hinted at this. . . . And since they did not receive the truth as it is but groped like the blind in darkness, such were their speculation and their sayings. But we shall hold to the words of our ancient sages, which are true and were received from the prophets, blessed be their memory. And we shall conclude that if this is so, and the lower things need the higher, this being a strict necessity, and the higher beings need the lower, to a limited extent, the entire world proves to be one individual (*ke'ish ehad*), and in this manner each particular thing will be attributed to the ten *Sefirot*, as if you were to say that a particular creature were to be attributed to a certain *Sefirah*.<sup>61</sup>

The nexus between the *Sefirot* and lower beings is seen as similar to that proposed in the Platonic and Neopythagorean theories of ideas and numbers. But the pagan philosophers did not receive the clear truth but a dim glimmering, inferior to the vision of the Jewish sages and prophets. The limited dependence of the upper on the lower is the obvious difference: The *Sefirot* need human acts of worship to function perfectly, a view that is alien to Plato. R. Yehiel ascribes the possibility of influencing the supernal powers to the anthropomorphic structure of the Sefirotic realm. Man reflects this structure in his shape and so can influence it by his deeds. This central claim of the theosophical-theurgical Kabbalah is elaborated by the Italian Kabbalist in the discussion that follows the passage just quoted. Elsewhere R. Yehiel soundly portrays the affinity and the distance between the two types of thought:

From the words of Plato it seems that he is close to the view of the Sages, of blessed memory, when he says that the lower and corporal world is in the likeness and image of the upper world. He also said that there are forms in the divine mind called universals (*kelalim*), which resemble the individuals. Still it seems to me that he did not penetrate deeply enough to know truly the profound sense of the Torah and her sages, blessed be their memory, but remained

outside the court: He attained and he did not attain. Thus he and the other ancients could not know the true quintessence of things, although they came close, as it was said in the *Midrash ha-Ne'elam*: They are close to the path of truth.<sup>62</sup>

Here too there follows a lengthy discussion on the centrality of man in ensuring the unity of the world. The deepest knowledge is not the awareness of the paradigmatic relations but the grasp of the dynamic influence on the higher world of religious acts fulfilling the *mizvot*. Plato knew the starting point of Kabbalah, the structural parallel of the higher to the lower, but the ultimate significance of the parallelism in practical and religious life escaped him. It is as though the Kabbalist were locating Plato in the cave, as one who had not received the clear revelation of the truth from its source. He is still dependent on the shadows, unlike the Kabbalists, whose knowledge of the truth is complete. Thus the reference to the palace of Maimonides' *Guide* (III 51), indicating that Plato lacks the inmost secrets of theology.

The dynamic interaction characteristic of Jewish theurgical mysticism disappears in another comparison of the Platonic ideas with the *Sefirot*, in R. Abraham Yagel's encyclopedic *Beit Ya'ar ha-Levanon*:

And the power that is in the lower beings is found in the upper worlds in a subtler, more exalted and sublime way. It is found in great purity and clarity in the holy, pure *Sefirot*, which are the truth, the *ideae* for all things.<sup>63</sup>

Yagel does not pursue the historical significance of the relation between the Ideas and the *Sefirot*. But elsewhere he does represent Plato as dependent on the Mosaic tradition. No major difference is mentioned. The Renaissance theory of *prisca theologia* and multiple sources of truth influenced him, and the older notion of a Jewish source for Plato's teachings was still active. R. Joseph del Medigo of Kandia, a younger contemporary of Yagel's, seems to hold this theory of Plato's Jewish instruction. In his *Mazref la-Hokhmah* he contests the view of his ancestor, R. Eliahu del Medigo, who had contemptuously compared Kabbalah with the teachings of the ancient philosophers rejected by the moderns:

My heart does not concur, since the ancient philosophers spoke more truly than Aristotle, who aimed to blame them only to vaunt himself alone. This is obvious to anyone who has read what is written on the philosophy and principles of Democritus, and especially on Plato, the master of Aristotle, whose views are almost those of the Sages of Israel, and who on some issues almost seems to speak from the very mouth of the Kabbalists and in their language, without any blemish on his lips. And why shall we not hold these views, since they are ours, inherited from our ancestors by the Greeks, and down to this day great sages hold the views of Plato and great groups of students follow him, as is well known to anyone who has served the sage of the Academy and entered their studies, which are found in every land.<sup>64</sup>

Del Medigo repeatedly quotes from the whole Neoplatonic corpus as disseminated by the Renaissance translations. He considers the Neoplatonic treatment of the Ideas as fully in accord with the Kabbalistic theory of *Sefirot*, and he calls attention to other congruences between the two systems.

Quite different is the attitude of Simone Luzzato, the Venetian rabbi who wrote at the beginning of the seventeenth century. In his treatise on the Venetian Jews he writes:

The second part [of the Kabbalah] is more speculative and scientific; it deals with the dependence of the physical world on the spiritual world, the supersensory world being the paradigm. They assume all corporeal things are grounded in primary roots and seeds which are like inexhaustible wells from which springs the power of the divine *dynamis* directed toward our material world as if through channels and pipes. This is the function of the ten [*Sefirot*]. . . . These ten *Sefirot* are somewhat similar to the Ideas posited by Plato, but in my opinion the reasons that influenced the theory of the Kabbalists are different from those of Plato.<sup>65</sup>

According to Luzzato, Platonic thought addressed an epistemological problem: how to comprehend the changing world. The ideas afford stability and so ensure the possibility of knowledge. The Kabbalists were seeking to explain the transition from the complete spirituality of God to the corporeality of the world. The *Sefirot*, viewed as "the Ideas of the Kabbalists," are differentiated from one another by their functions and by their spirituality. Luzzato mentions the four worlds

of the Kabbalists, each composed of ten *Sefirot*, which enable a gradual transition to the lower world. This cosmological role, widely assigned to the *Sefirot*, was emphasized by Yagel, who reinterprets the four worlds in Neoplatonic terms.

A contemporary of Luzzato, R. Abraham Cohen Herrera,<sup>66</sup> was deeply immersed in Neoplatonic thought and offered a speculative interpretation of the Lurianic Kabbalah according to Neoplatonic and scholastic principles. He proposes to understand the formative elements of the "*malbush*" or divine garment of the Kabbalah of R. Israel Sarug, by reading its Hebrew letters as pointing to Platonic Ideas. According to his special version of the Sarugian Kabbalah, the garment is not transcendent and does not precede the Primordial Man, *Adam Kadmon*, but is identical with him.<sup>67</sup> The Platonic Ideas refer to the elements that constitute the anthropomorphic archetype of all the worlds. R. Menasseh ben Israel, writing at the same time and also in Amsterdam, regards the Ideas as numbers and letters:

Plato recognized that the world . . . was not produced by chance. . . . It was formed by wise understanding and intelligence. . . . So these plans of the universe, which pre-existed in the divine mind, are termed by him Ideas. . . . Now these ideas or plans . . . are the letters [of the divine language]. This is treated in various ways in the *Sefer Yezirah*. . . . R. Joseph ben Carnebol explaining in his *Sha'arei Zedek* . . . Nahmanides . . . in the *Sefer ha-Bu'ahon*. . . . R. Barachiel in his *Perakim*.<sup>68</sup>

Early Renaissance authors were reticent toward Plato, even when perceiving the affinity between the Kabbalah and the theory of ideas, or they attributed a Jewish teacher to him. But by the last third of the sixteenth century, Plato and his Renaissance followers like Pico, Ficino and Cornelius Agrippa of Nettesheim became part of the spiritual patrimony of Jewish thinkers who were ready to accept the Platonists' influence even though they recognized its clear independence of Judaism. Perhaps the caution evident in the earlier Kabbalists reflects concerns lest there be a reduction of the Jewish mystical tradition to a mere recapitulation of Platonic views. But the impassivity of the Ideas, even in their Neoplatonic metamorphoses, restrained a more positive reception—even as the Kabbalah matured and continued to integrate Platonic, Neoplatonic, and Neopythagorean

thinking. The earlier Kabbalists were interested in the Platonic ideas at the level of the second *Sefirah* alone. But in the Renaissance the interest was more general, comparing the whole Sefirotic system to the realm of the Ideas. Renaissance Jews confronted an articulate Neoplatonic philosophy that could deeply affect the inner structure of Kabbalistic theosophy, and they absorbed, rejected, or responded critically in a fashion informed by awareness of that fact.

The most extreme expression of anti-Platonic feelings is found in the answer R. Yehudah Arie'el of Modena, that is, Leone Modena, addressed to a Christian correspondent:

E se Philone ha troppo Platonizzato in questa et altra grave materia, per cio non e stato accettato da noi, ne mai sono stati tradotti in hebreo.<sup>69</sup>

One of the fiercest anti-Kabbalists, Modena says that the deep influence of Plato is the reason for the rejection of the theology of Philo by the Jews. His statement sums up the concern of Jewish theologians not to permit too great an influence to Greek philosophy. The same concern may help to explain why Kabbalists like Yagel and Herrera, who did absorb a deep influence from the Greeks, remained outside the mainstream of the Kabbalah. But Modena's anti-Kabbalistic attitude was stronger than his anti-Platonism. For he uses a text of pseudo-Dionysius as a counterforce to the Kabbalistic view of prayer.<sup>70</sup>

### III. Negative Theology and Kabbalah

Medieval Jewish thought produced two major types of negative theology: the philosophical, which has both Neoplatonic and Aristotelian expressions, and the Kabbalistic. The former was formulated in the two classics of medieval Jewish philosophy, the *Fons Vitae* and the *Guide of the Perplexed*. The negative theology of the philosophers was not completely novel but was influenced by Islamic philosophies, which in turn were influenced by Greek Neoplatonic sources. In the Kabbalah, the major realm described in negative terms is the 'Eyn Sof, the source of the ten *Sefirot*. The affinity between the Kabbalistic views of the 'Eyn Sof and the Neoplatonic theology was emphasized by Gershom Scholem, who

understood some of its expressions in purely Neoplatonic terms.<sup>71</sup> He did not accept the view of some earlier scholars that the term 'Eyn Sof originated as a translation from the Greek<sup>72</sup> but envisioned it as a semantic mutation of the adverbial phrase, 'ad 'eyn sof.<sup>73</sup> Yet he still tended to present the concept as basically Neoplatonic in nature, finding nothing antagonistic to philosophical negative theology in the Kabbalistic understanding of the *Deus absconditus*. He saw clashes between the Biblical and Plotinian concepts of God, but was inclined to see them in terms of an opposition between philosophical and Scriptural modes of thought.

I would like to qualify Scholem's diagnosis by emphasizing some of the more positive conceptions of the Kabbalistic Infinite—the anthropomorphical rather than philosophical-theological concepts connected to the 'Eyn Sof. I believe that Neoplatonic negative theology was presented by some Kabbalists as an exoteric theory, while an anthropomorphic theology of the 'Eyn Sof was in their eyes more esoteric and thus closer to the truth.

In one of the texts of R. Azriel of Gerona's *Commentary on Sefer Yezirah* we learn of the possibility of contemplating the 'Eyn Sof:

Here he mentioned that all is from the 'Eyn Sof, and although the entities (*devarim*) have a measure and size, and they are ten, that attribute which they possess is infinite (*Eyn lah sof*). For the natural (*ha-mutbba'*) emerges from the sensory (*murgash*) and the intellectual from the heights of the Hidden (*Rom ha-ne'elam*), and the Hidden is infinite. Thus even the natural and the sensory and the intellectual are infinite, and the attributes (*middot*) were made in such a manner as to allow contemplation through them of the 'Eyn Sof.<sup>74</sup>

R. Azriel is one of the most important exponents of the early Neoplatonizing Kabbalah. But his reliance on the *via negativa* in some writings<sup>75</sup> does not preclude his assigning a material content to the concept of the Infinite. The gist of the above text is that infinitude is conceivable through the *Sefirot*, which actually preserve some of its infiniteness. Later in the same commentary R. Azriel applies the name 'Unique Lord,' *Adon Yahid* to the 'Eyn Sof, a description far removed from purely negative theology,<sup>76</sup> and he refers to the 'Eyn Sof as the *Dynamis* of the *Causa causarum* (*Koah*

'Illat ha-'illot), another positive characterization of the Infinite.<sup>77</sup>

R. Azriel grounds the contemplative process in meditation upon the structure of the human body, which corresponds to the ten *Sefirot*: Contemplation of the revealed and manifest (*ha-galui*) leads to the unseen—"You must contemplate from the manifest to the Hidden."<sup>78</sup> The anthropomorphic starting point leads, strikingly, to the *Sefirot*. Is anthropomorphism relevant there too? The answer is not simple. The *middot*, that is, *Sefirot*, were created to aid the contemplation of the 'Eyn Sof, just as the human body was made to enable us to contemplate the *Sefirot*. R. Azriel's colleague, R. Ezra of Gerona, states that emanation had a beginning, whereas the essences, the *havvayot*, are preexistent.<sup>79</sup> It is not clear whether these primordial essences are arranged in a human form, but the possibility cannot be neglected. A detailed analysis of the texts may clarify the situation. In any case, the influence of the Neoplatonic negative theology is far less important in the early Kabbalah than modern scholarship has supposed. Positive views of the Neoplatonic worlds and the theory of the letters and *Sefirot* as ideas are much more prominent, as we have seen.

Clearly in some late thirteenth-century Kabbalists there is an esoteric theosophy of the 'Eyn Sof, reliant on an anthropomorphic structuring of ten entities that are supernal, static roots of the ten dynamic *Sefirot*, the *Deus revelatus*.<sup>80</sup> The static nature of these roots seems to counter the personalistic tendency of some Zoharic anthropomorphic discussions of the highest level of the divine world. The post-Zoharian Kabbalists sometimes call the static entities *Zahzahot*, *Zihzuhim*, or inner *Sefirot*.<sup>81</sup> Such a theology seems to represent an attempt to maintain the ancient Jewish notion of the *Shi'ur Komah*, the anthropomorphic body of the deity as spoken of in the Heikhalot literature, by projecting it into the deepest divine realm in Kabbalistic theosophy. Here we can hardly speak of a dominant influence of Neoplatonic negative theology. It is hard to say how central the anthropomorphic theosophy may have been, since it was treated as especially esoteric and has only recently been analyzed in scholarly studies. In time we may discover more instances of a "deeper" positive understanding of the 'Eyn Sof, and the relationship of Kabbalistic theosophy to Neoplatonic negative theology may undergo some significant changes.

The anthropomorphic conception of the 'Eyn Sof was surely influential in the *Zohar* and later on, especially in the works of R. David ben Yehudah he-Hasid, who wrote under the profound influence of this book. He located an anthropomorphic configuration in the bosom of the 'Eyn Sof: ten *Zahzahot* which seem to found, for him or his sources, an esoteric interpretation of the *Shi'ur Komah*.<sup>82</sup> Yet immediately after the appearance of the *Zohar*, another type of Kabbalistic theosophy emerged, which strove to purify the highest realm of the divine from all anthropomorphic attributes. Using the term *Causa causarum*, 'Illat kol ha-'illot in the case of the author of the *Tikkunei Zohar*, or 'Illat ha-'illot alone in the case of R. Menahem Recanati, these Kabbalists employed explicitly negative attributes to reinterpret the theosophy of the *Zohar*.

After the expulsion from Spain, the concept of super-*Sefirot* within the 'Eyn Sof was propagated by the exiles. A clear expression of this view is found in the commentary of R. Yehudah Hayyat on *Ma'arekhet ha-Elohut*. The latter work, an anonymous classic of the early fourteenth century contains one of the most explicit statements of negative theology in the Kabbalah, arguing that the 'Eyn Sof is not mentioned in the Torah because there is no way even to hint at Him.<sup>83</sup> The commentator, an exponent of classical, post-Zoharic Spanish Kabbalah, uses the term *Zihzuhim* to designate the super-*Sefirot* in the bosom of the 'Eyn Sof.<sup>84</sup> The Italian Kabbalist R. Elhanan Sagi-Nahor echoes this approach.<sup>85</sup> But in time this type of theosophy disappears from the Italian Kabbalah, probably eclipsed by the negative theology accepted by Italian Jews from medieval Neoplatonism and corroborated by the work of Renaissance Christian thinkers influenced by the translations of Marsilio Ficino.

We find an example of the elimination of a reference to the roots of the *Sefirot* in the 'Eyn Sof in Yohanan Alemanno's summary of the stance of R. Yehudah Hayyat:

Hayyat<sup>86</sup>

Although you will find in the *Tikkunei Zohar* in several places that the name *Yud He Vav He*, *Yud Hi Vav Hi* refers to the 'Eyn Sof, it is to be understood as

Alemanno<sup>87</sup>

It is said in the *Zohar*<sup>88</sup> and in the *Sefer ha-Tikkunim* that the name *Yud He* is said of the 'Eyn Sof. But He has no known name because if He had a known name

explained above: these ten letters are the ten *zihuhim* hidden within Him, and they are the ten *Sefirot*, comprised in the name YHVH. But He has no known name. This is hinted at by Elijah, of blessed memory . . . that You have no known name, since you fill all the names, and You are the perfection of all of them, etc. The meaning of this is that if He had a name that can be known He would be limited to that name alone, and it would be impossible to take Him away from it, and He would emanate only to that name.

Here and elsewhere where he might have used Hayyat's view of the supernal *Sefirot*, *zihuhim* as roots of the traditional *Sefirot* in the 'Eyn Sof, Alemanno suppresses the words of his source. Study of the way Alemanno quotes Hayyat's Zoharic sources shows that the exclusion is not accidental. Moreover, the terms Alemanno uses to describe the First Cause or *Causa causarum* are plainly taken over from the *Liber de Causis* in its Hebrew translation.

The theosophy of the *Zahzahot* was likewise rejected by R. Moses Cordovero, who accepted only the view that there are three *Zahzahot* in the 'Eyn Sof, which are not understood anthropomorphically. However, R. Isaac Luria was influenced by the doctrine of the ten supernal *Sefirot*, which in his system became the *Adam Kadmon*, placed above the *Sefirot*.<sup>89</sup> While it was not identical with the 'Eyn Sof, it was called by that name, to point to the exalted status of the figure above all other things.

At the beginning of the seventeenth century, the negative theology disseminated in Renaissance translations and original writings made a deep impression on many Kabbalists. R. Abraham Yagel,<sup>90</sup> R. Menasseh ben Israel,<sup>91</sup> and R. Joseph del Medigo bear testimony to the depth of penetration of the Neoplatonic negative theology. Although pursuing discussions that began in the medieval Kabbalah and continued in the Renaissance,<sup>92</sup> the seventeenth-

which designates His essence, He would operate only according to that name.

century authors owe much to the Christian and pagan sources, as they openly acknowledge.

The attenuation or even obliteration of that trend of theosophy which attributes anthropomorphic characteristics to the 'Eyn Sof represents a retreat from the dynamic and mythical Kabbalah prevalent in the Spanish tradition and the cultivation of a much more philosophical theosophy consonant with the Christian Neoplatonism of the Renaissance. The shift is paralleled by a new willingness to interpret the *Sefirot* in Platonic terms. After reducing the mythical elements inherent in the dynamism of the *Sefirot*, there was no need to look for static roots beyond or behind them. The *via negativa* preoccupied Jewish authors in the first half of the seventeenth century much more than in previous periods, as is evident from the writings of Herrera, Menasseh ben Israel, and Joseph Shelomo of Kandia. There is evidence that R. Joseph Shelomo devoted a treatise to negative theology, which he planned to print. The printer of his *Novelot Hokhmah*, R. Shemuel ben Yehudah Leib Ashkenazi, noted in publishing the latter work:

The Rabbi the author wrote a treatise to show that there is no name which reflects the essence of the 'Eyn Sof, and I plan to print it, if God so decree.<sup>93</sup>

Unfortunately the plan was not carried out.

It seems that in the whole history of the Kabbalah negative theology never enjoyed the interest among Kabbalists that it had in the period when Renaissance Neoplatonism was already in decline, at the beginning of the seventeenth century. For some Italian Kabbalists, the more mythic the Kabbalah they encountered (as in various versions of Lurianic Kabbalah), the more they inclined to accentuate the mythic elements by imposing a philosophical significance upon the authentic Kabbalah of Safed. It was in Italy, the stronghold of the Neoplatonism of the Renaissance, that the Kabbalah underwent the most powerful impact of negative theology.

But negative theology found its way into Kabbalah from another source as well: Ismā'īlī theology. Following up on the assumption that God is wholly beyond the reach of the human mind, this Islamic sectarian school treated the "first creature" as the being to be addressed in worship. Any attempt to direct one's thought to the

Transcendent was regarded as heresy.<sup>94</sup> God was described as beyond existence and non-existence.<sup>95</sup> By the thirteenth century we find the theory of the "first creature" playing an important role in the religious life of the Kabbalah, alongside the view that God transcends both existence and non-existence.<sup>96</sup> A reverberation of the negative theology implicated with the concept of the "first creature" is heard in the works of a Kabbalist who wrote in Spain before the expulsion and later in Jerusalem, R. Abraham ben Eliezer ha-Levi. He writes that higher than the ten *Sefirot* there is an entity different from the First Cause, called "the first Simplicity," *Peshitut Rishon*.<sup>97</sup> In other writings he calls it "the first creature" or three lights higher than the *Keter* and lower than the First Cause. These, he says, are beyond the comprehension of anyone. The assumption that anything below the level of the First Cause is incomprehensible seems to reflect the *Ismā'īlī* emphasis upon negative theology. The Kabbalist was apparently acquainted with concepts or fragments of the *Theology of Aristotle*, the medieval abridgement of Plotinus' *Enneads*. For he describes Aristotle, in his "later" period as almost a Kabbalist, who received his doctrine from R. Simeon the Righteous. According to this late Aristotle, the ancient philosophers believed in a deity who coexisted with an eternal world, but he himself, Aristotle the Kabbalist, knew that above that deity was a higher deity who is the source of the lower one.<sup>98</sup> The lower deity, connected to the world through the act of emanation, would be the *Ismā'īlī* "first creature," mediating between the First Cause and the *Sefirah* of *Keter*.

To sum up our findings: In the medieval Kabbalah the influence of the Neoplatonic theory of Ideas is easily traced, and the positive ideas of Neoplatonism recur in Renaissance Kabbalah. But the influence of negative theology is marginal in medieval Kabbalistic texts. It comes to the fore by the end of the fifteenth century and reaches its apogee in the seventeenth. Neoplatonic reinterpretations of the Kabbalah, especially those of the early seventeenth century Kabbalists, mediated its penetration into European culture, through the translations of Knorr von Rosenroth, as Professor Popkin's paper illustrates.

28. *Sefer ha-Emunah ve-ha-Bitahon*, 364.
29. I emphasize that the essences in the *Sefirah* of *Hokhmah* are not identical with the *Sefirot* in general, which for most Kabbalists are dynamic entities quite unlike the static Platonic ideas. As paradigms of all creatures, the essences are found only in *Hokhmah*, and the other *Sefirot* behave quite differently from Platonic ideas.
30. *Sefer ha-Emunah ve-ha-Bitahon*, loc. cit.
31. *Sefer ha-Emunah ve-ha-Bitahon*, 386. See Scholem, *Origins*, 429, pointing out the affinity of this peculiar view of the Active Intellect to Neoplatonism. The Kabbalistic discussion of the 'Ayn as a symbol of the highest triad is reminiscent, as Professor John Dillon has kindly pointed out to me, of the view attributed by Proclus to Theodotus of Asine. Note the correspondence of the *spiritus asper* and the *Alef*.

- See Proclus, *Commentaire sur le Timée*, tr., A.-J. Festugière (Paris, 1967) 3.318; Asi Farber, "On the Sources of Rabbi Moses de Leon's Early Kabbalistic System," in J. Dan and J. Hacker, eds., *Studies in Jewish Mysticism, Philosophy, and Ethical Literature, presented to Isaiah Tishby* (Jerusalem, 1986), 96, n. 65 (Hebrew). R. Isaac the Blind, following an even earlier tradition, interpreted *Ehad*, One, similarly as suggesting the *Sefirot*: *Alef*=*Keter*, *Het*=Eight *Sefirot*, and *Dalet*=the last *Sefirah*; see my "The *Sefirot*," 279-80.
32. See S. Pines, "La Longue recension de la théologie d'Aristote dans ses rapports avec la doctrine ismaélienne," *Revue des Études Islamiques* 22 (1954): 7-20.
  33. *The Commentary on the Talmudic Aggadot*, ed. I. Tishby (Jerusalem: Magnes Press, 1945), 83.
  34. *Commentary*, 820.
  35. See Alexander Altmann, "Isaac Israeli's 'Chapter on the Elements' [MS Mantua]" *JJS* 7 (1956): 31-57.
  36. See Scholem, *Origins*, 418, 436-39. The emergence of the Will as the highest divine manifestation in the works of these two Kabbalists and to a lesser degree in those of R. Asher ben David, the nephew of R. Isaac the Blind, preceded the similar development in the writings of R. Isaac ben Abraham ibn Latif, who seems to have been influenced both by the Neoplatonic sources and by the Ismā'īliyya; see Heller-Wilensky.
  37. See R. Azriel's *Sha'ar ha-Sho'el* in Meir ibn Gabbai's *Derekh Emunah* (Berlin, 1850) fol. 3a. On the early Kabbalistic views of the spiritual worlds, see Scholem's important essay, "The Development of the Doctrine of the Worlds in the Early Kabbalists," *Tarbiz* 2 (1931): 415-42; 3 (1932): 33-66 (Hebrew). The source that influenced R. Azriel's view seems to echo the Neoplatonic terms *cosmos noetos* and *cosmos aisthetos* reflected in Azriel's use of 'Olam. Thus Scholem may overstate the impact of the Gnostic *aion* as the basis of the Kabbalistic *pleroma*; 416-17. He inclined to minimize the influence of Neoplatonic sources on early Kabbalah as to this issue.
  38. See his *Sefer Meshiv Devarim Nekhoḥim*, ed., G. Vajda (Jerusalem: Israel Academy of Sciences and Humanities, 1969), 78, 100-101.
  39. See Israel Ta-Shema, "On the Commentary on the Aramaic Piyyutim from the Mahzor Vitry," *Qiryat Sefer* 57 (1982): 707-08 (Hebrew).
  40. *Commentary*, 82; for the ontic division of *Maḥashavah*, *Dibbur*, and *Ma'aseh*, 110, where also the origins of the *Sefirot* are located in the Divine Will; cf. Scholem, *Origins*, 438-39. At *Commentary* 108 the second *Sefirah* is called the "beginning of Speech."

## Love and Intellect in Leone Ebreo: The Joys and Pains of Human Passion

Reflections on his Critical Panpsychism and  
Theory of "Extraordinary Reason"

Hubert Dethier

Ordinary (practical) reason fluctuates between extremes, its goal being the preservation of life; extraordinary (contemplative) reason disregards the normal conventions of prudence and often leads to alienation and self-sacrifice. Comprising both disinterested love and the desire to "acquire" or "attain" the beloved, its ambivalence is personified in the figure of Sophia, the reluctant mistress of the *Dialogues*. The ordinary reasonableness of the day to day world is challenged here by the radical intransigence of a higher love, which bears with it a higher standard of reason. This philosophically exalted blend of love and desire is the source of Philo's paradoxical desire to both live and die.

---

\* I am deeply indebted to Lenn Goodman for his critical reading of an earlier draft of this paper and for suggesting a number of pertinent revisions and improvements. The responsibility for any remaining shortcomings lies with the author. My thanks are also due to Mrs. Margaret Lee for her help in preparing the typescript.

### 1. The Achievement of Leone Ebreo

Leone Ebreo's achievement resides in his effort to present a syncretic philosophy elaborated in all aspects, from metaphysics to ethics, in a truly coherent and systematic manner. Philosophy in his view seeks to give the soul an awareness of its higher destiny, an assurance of its ultimate union with God. This "*pia philosophia*" affirms the identity of rational and religious truth, the harmony of the logical-metaphysical order with the testimony of Revelation. The focus of this paper is Leone Ebreo's encounter with the theories of Avicenna and Averroes on the interactions of human and divine intelligence. For here he recaptured the profound inner sense of Platonic idealism, and, through his rediscovery of Plato and Plotinus, brought to life a pantheistic aspect of the thinking of Averroes, discovering an interdependence of God and man within a higher unity. Of course not just any kind of unification of the cosmos is tantamount to pantheism. It is the particular strategy that Ebreo adopts in behalf of his project of unifying the cosmos that will justify our characterization of his philosophy as pantheistic.

In his introduction to the Italian *editio princeps* of the *Dialoghi*, Carl Gebhardt characterizes the unitive perspective that attracted Leone Ebreo as follows: In itself, the Intellect—potential as well as actual—is of no specific sort, but is identical with the totality of things, which are here potential, there actual. In its actuality, however, the intellect comprises all grades of Being in perfect unity and simplicity.<sup>1</sup> From this Neoplatonic thesis, Leone draws an inference long latent in Averroism and one which has often led to his rejection as a heretic: He identifies the *intelletto attuale* (actual intellect) with the Deity and thus reaches a Pantheism or, more precisely, a Panlogism. For he had already identified the Intellect with the totality of things: "The idea of the world does not really exist in the divine understanding, but is the divine understanding and the divine spirit itself. For the idea of the world is the highest wisdom, through which the world was made. And the divine wisdom is the Word" (III, 121a). Although the Word here still appears to differ somewhat from God, Leone's reading of Logos as Nous urges complete identification of God with His wisdom. Gebhardt cites *Dialoghi*, III, 122b-123a: The first Intellect in Aristotle's sequence

of disembodied Intelligences, is one and the same with the highest God and in no way different, except verbally. The essence of the Divine is nothing other than the highest wisdom and intelligence. As the purest and simplest Unity, God/Intellect produces the universe with all its parts, which are ordered into a whole; and, in producing it, He knows the whole and all its parts, and the parts of its parts in a supremely simple act of knowing. Knowing Himself, as the highest wisdom, on which everything depends as image and likeness, He is, while remaining one in Himself, the knower, the known, the knowing and the wisdom—the one who understands, the act of understanding, and the thing understood. This is the most perfect knowledge of the whole universe and of all created things, far superior, far more perfect and far more definite than knowledge drawn from things. For that knowledge is caused by the things known and so is divided, manifold and imperfect. But this knowledge is the ultimate cause of all things and so is free of the deficiencies of mere effects. The unity and simplicity of the Intellect allows infinite and supremely perfect knowledge of the whole universe.

The pantheism of the Vedanta argues that since God is All and One, what is many must be illusory. The pantheism and near pantheism characteristic of the European Middle Ages evolved, by contrast, from the view that because God alone truly is, all that is must in some sense be God. The ancestry of this view is Platonic or Neoplatonic, relying on the notion of true being. It would be misleading to call Neoplatonism itself pantheistic, although it conceives the material world as an emanation of the Divine. For the fallen and radically imperfect character of this world is always emphasized. Yet the translation of Neoplatonic themes of emanation into Christian terms by John Scotus Eriugena (ca. 810 - ca. 877) led to condemnation of his work as heretical precisely because of its apparent break with monotheism. Eriugena may not seem to be completely pantheistic, in that he does not treat every aspect of nature as being part of the divine in the same way and to the same degree. But by this criterion no thinker could ever be judged a pantheist! In every medieval case after Eriugena, the imputation of pantheism is at best inconclusive. It is only since the sixteenth century that genuine pantheism has become a familiar European phenomenon. Yet we shall argue that Ebreo resorts to a kind of pantheism, that is, the

identification of God and nature, in order to ensure God's access to nature as Knower and as Creator. A prototype of this approach is clearly present in Eriugena.

According to Eriugena, the whole, "natura," consists of four species of being:

what creates and is not created  
 what is created and creates  
 what is created and does not create  
 what is not created and does not create.

The first is God as Creator; the last, God as that to which all created beings return. The second and third comprise the created universe, which is passing from God in His initial form to God in His final form. Eriugena states that each class of beings belongs to a different phase in a historical flow, but he also views this expression as a misleading, if necessary, figure of speech. "Natura" is eternal; the whole process is eternally recurrent; and everything is a theophany, a manifestation of God.

## 2. Resistance to the temptations of pantheism

Suzanne Damians<sup>2</sup> argues that Leone Ebreo resisted the temptation of pantheism inasmuch as he preserved the relative independence of created beings. Thus the work of salvation, which is open to the most intelligent creatures, acquires a sense of personal conquest or achievement, and one can conceive God in more personal terms than in, say, Spinoza. God's love will not be strictly necessary, but will represent "a grace and benevolence more in keeping with the scriptural images of God as father and king." Further, what motivates creatures for Ebreo is final causes, which stimulate their desires and lead them to their ultimate perfection. This view is hardly in keeping with a necessitarian pantheism. Yet there is a pantheistic tendency in Abarbanel which recalls and in some ways exceeds the pantheism of the Stoics! For even Marcus Aurelius, when he addressed the Universe as a deity, did not simply address all that is, but rather the ordering principle (*hegemonikon*) that informs all that is.

The pantheism of the Stoics, like that of Eriugena or Bruno, is founded on the view that the universe must be a single, all-inclusive system, if it is to be intelligible. Thus their pantheism is derived from their ideal of explanation. Leone Ebreo similarly derives his metaphysical unity from purely intellectual premises:

1. Every being, especially every intelligent being, is united and unites itself with the world in such a way that it is in harmony with all other creatures.<sup>3</sup> Thus the world forms a single, harmonious system, reflecting the harmony of the intellectual world.
2. Thus, the perceptible world is emblematic of the intelligible world. This correspondence is fraught with pantheistic significance. Causally, the intelligible world is the unity that underlies the observable unity of nature. But from an experiential point of view the phenomenal unceasingly bears witness to its divine source. Since the phenomenal and the intelligible are counterparts, "Natura" is eternal, the whole process is eternally present, and everything, as in Eriugena, is a theophany.
3. Ebreo moves away from Stoic materialism, for instance when he objects to the notion of harmony as a "matter of dimension" and states that it is "formal grace." But he does not give a purely Platonic account (III 4). Rather he offers an almost Baconian view of the perceptible, remarkably expressed in the language of Platonism: Physical beauty is a mere shadow or image of the intellectual "splendor" of the underlying Forms or Ideas. But such shadows are necessary, since Ideas are first known as images of sensible objects, just as the concept in the mind of an artist is known through the work of art.
4. If Ideas are the original patterns of all created things, do they not, perforce, share the enormous diversity and even, to some extent, the multiplicity of these things? Leone answers this objection by recalling two Plotinian premises:
  - a. an effect is always inferior to its cause, and
  - b. corporeal substance is caused by intellectual matter.

So, Leone returns to the idea of the universe as an organic whole, its many parts unified in a single body. In the mind of the divine artist the multitude and diversity of his creation is "pure unity

and true identity." The unity-in-multiplicity of Ideas is appropriate to their intermediate position between the artist and his work. Reliance on the Plotinian notion of the unity of the Ideas as thoughts of the divine is what makes Ebreo a pantheist. For such a view intentionally blurs the distinction between the One and the many.

For Ebreo's relation to Stoic materialism, Dialogue Two is of great importance. It expands the discussion to cosmological scope by showing that love is a principle that governs the entire created universe: the world below the heavens, the heavens themselves, and the disembodied intellects or angels. In the crucial final section Ebreo shows how love is the force, or principle of interaction and unification connecting these three levels. Such unity or love between higher and lower is imitated in lower beings as well, proving that without love the universe as a whole and all the creatures in it would not exist.

The closing section of Dialogue Two discusses love among the heavenly intelligences. Here Leone addresses what is perhaps the critical problem of his entire system: How does one explain the love of a superior for an inferior? Why would the intelligences care to move the lower spheres; why would a perfect God love a sinful world? Leone explains that a generous love is better than a selfish love. A father loves his son in order to improve him, not for any personal benefit. Moreover, a defect in creation implies a defect in the Creator. The immediate inference would be that God loves and blesses His creation for the sake of His own perfection, which does not contradict His loving it for its own sake. But the further implication is that human sin may adversely affect God himself. Leone frequently returns to the view that God himself depends on man's righteousness, a notion common to many Kabbalistic writers and often based on the saying that the Just Man is the foundation of the universe (Proverbs 10:25).<sup>4</sup> Not wanting to distress religious sensibility by the boldness of this concept, Leone prefers to emphasize the positive side of the argument: that the mutual love between superior and inferior leads to their union, which is "the principal end of the highest Maker and Sovereign God in the production of a world of ordered diversity and unified plurality."

After a brief discussion of the love of the intelligences for God, the author elaborates on his theme of the universe as a single organism:

The entire universe is like an individual or person, and each of these corporeal and spiritual or eternal and corruptible things is a member or part of this great individual, the whole and each of his parts having been produced by God for the common end of the whole, together with an end proper to each of its parts. . . . The end of the whole is the unity and perfection of the entire universe . . . and the end of each of the parts is not only that it be perfect in itself but that it may thereby contribute to the perfection of the whole; and this universal end is the prime intention of the Deity.<sup>5</sup>

The argument, also found in Bernard Silvestris' *De universitate mundi* or *Cosmographia* (circa 1143),<sup>6</sup> seeks in part to legitimize a compromising of the intellect's crucial contemplative activity. For the proper act of the Intellect is to know itself and thus all things within itself, as the divine essence shines within its clear vision like the sun in a mirror. But Intellect must also consent to "move a material heavenly body, an act extrinsic to its own true essence."<sup>7</sup> A corollary for the human case is the recognition that the joys of contemplation may best be enjoyed after death.

It is love that imparts the unity at each level and thus explains the existence and active functioning of each thing in the universe and each level of the celestial hierarchy: Just as God is united with His creation through love, the angels join with the celestial bodies, the world soul with the sphere of generation, and the intellectual soul with the human body. The poles of these syzygies are familiar: upper and lower, spiritual and physical, active and passive, light and darkness—and, especially meaningful in a discourse on love, male and female. We are now prepared for Ebreo's broaching of the Kabbalistic insight that "all creation is female with respect to God the Creator" and for the next Dialogue, which will elaborate on the mystic theme of the cosmic union of God with His creation.<sup>8</sup>

### 3. Noesis

Leone maintains that only the intellect in man is eternal and capable of approaching the Divine. He discerns five levels of intellect, each of which reflects the divine beauty according to its own nature or capacity: (1) human intellect *in potentia*, (2) human

intellect *in actu*, (3) human intellect coupling or in "conjunction" (cf. Ibn Bājjah) with pure or angelic intellect, (4) angelic, and (5) divine intelligence. Man's quest is for union with the Active Intellect. The Philosophers regard it as the lowest of the angelic intellects, but true believers identify it with God Himself.<sup>9</sup> The two views are complementary rather than contradictory according to Leone. The first describes the limits of man's natural reason, but the second describes the glory conferred by divine grace, the angelic vision of God.

Great difficulties are involved in the notion of an Active Intellect separated from the minds it actualizes and able to actualize them only through such human faculties as memory, imagination and abstraction. But Leone succeeds in reconciling the transcendence of the Active Intellect with its action upon the individual intellects of angels and men. His detailed commentary on the functioning of "noein" places him among the Neoplatonic commentators of Aristotle's *De anima* and with Alexander of Aphrodisias' *On Intellect*.<sup>10</sup> Intellection, in its imperfect, human form, cannot be explained without recourse to that which is absolutely perfect. The transcendent intellect is what the human mind thinks, because that intelligence both thinks and creates the human mind. But even the distinction between the two is misleading. For in the intelligence in the act of thinking, the object of thought and the act itself are one. The words are Aristotle's in the *De Anima* (III 5). But Leone's Neoplatonic idealism carries their implications far beyond what Aristotle envisioned when he enunciated them as a psychological and epistemological insight.

Ebreo cleaves to the Neoplatonic tradition in holding that forms are the determinants of nature and thus that genera are conceptually and ontologically *richer* than species. That his inspiration is from Plato and Plotinus is evident in the role he ascribes to light, both literally and symbolically. For physical light symbolizes the operation of the Active Intellect which makes us understand and allows us to become what we understand. This higher light makes us intelligent beings in the "exercise of our essence." The idea of the good is the sun of the intelligible world. It accounts for the harmonious organization of the universe as the ontological and epistemological principle of the Ideas, ordering all by logic and finality. The highest genera of Being emerge from the Idea of the

One or the Good, whose truth does not require conformity to any other object. For that truth is not *secundum rem*. Rather, as Plotinus would say, "Intellect provides it (the soul) with the forming principles, as in the souls of artists the forming principles for their activities come from their arts."<sup>11</sup> The same Neoplatonic position had been held by Maimonides.<sup>12</sup> As Plotinus himself explains: "Intellect therefore really thinks the real beings, not as if they were somewhere else: for they are neither before it nor after it; but it is like the primary lawgiver, or rather is itself the law of being. So the statements are correct that 'thinking and being are the same thing' and 'knowledge of immaterial things is the same as its object' and 'I searched myself' (as one of the real beings); so also are 'recollections,' for no one of the real beings is outside, or in place, but they remain always in themselves and undergo no alteration or destruction: that is why they are truly real."<sup>13</sup> In the same vein, Leone remarks that in a single act of intellection, if it is sufficiently complete, knowledge of all things can be comprised (*Dialoghi* I 41).

Although God is perfectly one and simple, a mysterious multiplication occurs within Him. Just as Eve is said to have sprung from the body of Adam, the original active entity, God's beauty or simply essence, produces a feminine entity. Thus we can distinguish: (1) God's beloved, beauty or goodness, (2) His wisdom or intellect, the active lover, (3) the love that arises between the two. Since the beloved is always superior, Leone concludes that God the beloved is superior to God as lover, contradicting the Christian view that Father and Son are equal. Yet, since God is pure act, beloved, lover and love are identical in Him—an interesting extension of the traditional Aristotelian notion of the identity of knower, known and knowledge in the act of knowing.<sup>14</sup>

Beyond his original, intrinsic love, God also loves extrinsically. For, in loving himself, God also desires to reproduce his beauty. Thus God has two loves: (1) the first towards himself, (2) the second towards his images or creatures. The crucial role is played here by the divine Intellect, which, in addition to loving God in perfect contemplation, also contains all the Ideas or patterns of creation. The emanative process, as described here differs slightly from Bernard Silvestris' description in *De universitate mundi*. In the *Dialoghi*, the Intellect is female in its love toward God, but active or male in its love towards creatures. The original dialectic of love is repeated on

this lower level: The divine Intellect contemplates itself as well as God, and from this contemplation a female entity is produced, again on the pattern of Eve from Adam. This new female element is chaos or Prime Matter. These two, Intellect and Chaos, are conceived as male and female, Prime Form and Prime Matter, the original parents of creation. From their mutual love emerges all generation.

#### 4. Leone Ebreo and Spinoza

Leone's description of the intellectual love of God and his differentiation of five levels of intellect, each of which reflects the divine beauty according to its own nature or capacity (III, third question) leads us to inquire after connections between Spinoza's conception of intellectual love of God and Leone's related Neoplatonic conception. In both philosophers the link between man and God is intellectual, critically dependent on knowledge. Yet in Leone Ebreo awareness of a lack is central. In Spinoza the intellectual love of God involves a recognition of necessity, not of the order of causes outside us, but of the sequence of causes affecting us. To attain true love, we must know ourselves and the affections of our soul insofar as these follow from the necessity of the eternal essence of God. But in both philosophers attainment of the love of God involves knowing our own essence in God and the essence of all things. It is by knowing the immensity of God that we can love Him, actualizing our essence as a part of the infinite essence of God.

For both philosophers the intellectual love of the soul for God is the very love by which God loves himself. In Spinoza this is because the human soul, insofar as it is the idea of the body under the form of eternity, i.e., insofar as it has knowledge of the second and third kinds, forms a part of the Idea of God. It "understands in God, and does so through the very intelligence of God." It is therefore the very joy of God, apprehending the plenitude of his being in the logical sequence of his infinite modes:

it is apparent that our mind, in so far as it understands, is an eternal mode of thinking, which is determined by another eternal mode of thinking, and this again by another, and so on to infinity: so that

together they all constitute the eternal and infinite intellect of God. (*Ethics* V, Prop. 40)

The joy of the soul taken up in God is a finite mode of the joy of God and is taken up for ever, the part identifying itself with the whole. Thus the famous corollary of Proposition 36 in Part V of the *Ethics*:

Hence it follows that God, in so far as he loves himself, loves men, and consequently that the love of God for men and the mind's intellectual love towards God are one and the same thing.

Here we find under another guise the famous circle of Leone Ebreo: The arc of "reductive" loves, that turn back to God, can exist only by virtue of the original arc of "productive" loves.

For Spinoza, however, the unitive knowledge of the soul yearning towards God is not knowledge of a lack that commands aspiration toward sovereign perfection. Rather our upward reaching only expresses in duration what we are in fact throughout eternity. For we are always in God and through God. Duration for Spinoza is only an appearance. So the intellectual love of God is not a kind of progress but an inner nature constituted for all eternity. It is for us to enter it, or rather find it. But it is a kind of intellectual grace that cannot be withheld.

In both philosophies, there is a way for man to achieve beatitude, and this is above all through the transformation of knowledge. To conceive this achievement as a kind of personal adventure is far more difficult in Spinoza than it is in Leone Ebreo, because Spinoza holds time to be only an appearance; and an individual personality, merely a transitory mode. This contrast may seem a bit unfair to Spinoza, because it presses his monism too hard, ignoring his seriousness about the drama of the moral life and equally ignoring, for example, the opening passage of *De Intellectus Emendatione*. Nevertheless Suzanne Damien argues that in the framework of Spinoza's intellectualism the reactions of a will that would respond to the circumstances of an individual destiny so as to achieve self-mastery, while unceasingly challenged by the solicitations of an animal nature, are hardly conceivable. The source of our salvation in Spinoza is the act of understanding in a certain

way, a task of pure intellection, which detaches us from an inadequate apprehension of the actuality of things and ourselves and brings us at once the experience of eternity:

We conceive things as actual in two ways: either insofar as we conceive them to exist in relation to a certain time and place, or insofar as we conceive them to be contained in God and to follow from the necessity of divine nature. But the things we conceive in this second way as true or real we conceive under a certain aspect of eternity, and to that extent their ideas involve the eternal and infinite essence of God, as we showed in Prop. 45, Part II.<sup>15</sup>

It is from this that Spinoza goes on to argue: "Insofar as the human mind knows itself and its body under the aspect of eternity, it necessarily has knowledge of God, and knows that it exists in God and is conceived through God" (*Ethics*, V, Prop. 30).

It is only through the realization of our intellectual capacity to see things in God that we experience eternity. So everything seems to happen as though, on the level of the intellection of the second and third kinds, a radical change takes place in man. We suddenly become independent of the sensory. The third kind of knowledge takes over, dependent on the mind as its formal cause insofar as the mind is eternal (*Ethics* V, Prop. 31). The progress of the soul towards beatitude does not find its true cause in the effort itself from which it seems to result or in the desire to attain a greater perfection or power, since in the long run this effort expresses only what we are throughout eternity, in God and through God. It is for this reason that Spinoza can affirm: "Blessedness is not the reward of virtue, but virtue itself; nor do we enjoy it because we restrain our lusts; on the contrary, because we enjoy it, we are able to restrain our lusts."<sup>16</sup> In Spinoza, as Victor Delbos remarks, it is always the knowledge of our rational union with God that is the means of salvation, "and not the pretension of our will to exceed what we are by relying on the transitory modalities of our present life."<sup>17</sup>

It is easier in the perspective of a creationism like Leone's to account for the love that moves us from awareness of our imperfection to the appeal of an ideal that arouses us. Here we dramatically envisage real progress toward beatitude. Yet while progress in time cannot define ultimate felicity, Spinoza does see

temporal duration as a means to the achievement of happiness. It seems he arrives at this possibility in two ways: (1) through the notion of the anteriority of an intelligible nature,<sup>18</sup> (2) through conferring an ontological status upon the tendency (*conatus*) to be and to persist in being, the desire for power which truly manifests itself only in the realization of our intellectual nature, and yet which is the common principle of all life, whether in those who are not wise men or in those who are wise and have found the intellectual way of living in God. The first of the two alternatives privileges the attribute of thought over that of extension; the second discloses the common basis of the affections which are passions and those which are no longer passions but actions, because they are caused in man by the rational sequence of his ideas. It is perhaps not too brash to consider that it was the reading of the *Dialogues of Love* that enabled Spinoza to develop his conception of the dialectic of the salvation of man.

Spinoza is akin to Leone and through him to Neoplatonism in his mistrust of Aristotelian abstraction. The universal idea drawn from experience of the multiplicity of things is not the purest reality. The generic representation of the secant is not the essence of the secant, for this depends on the relation of the secant to the circle. The essence of the tangent is not all the common characteristics of all tangents but the definition of the tangent as limit of the secant. The essence of man is not the general idea drawn from the individuals met in experience; rather it is determined in the relation of the individual mode to God. In Spinoza, as Léon Brunschvig has clearly shown, reality is totality, envisaged not as a whole depending on its parts but as a unity that bears the reason for its existence within itself.<sup>19</sup> This totality is the ultimate source of determination in all that is. As Spinoza makes clear, a being does not exist by virtue of its limit, which is only an extrinsic definition, but through its inner principle, which gives it being and the force to persevere in its being.<sup>20</sup> Thus: "Every idea of every body or individual thing actually existing necessarily involves the eternal and infinite essence of God."<sup>21</sup> Here in Spinoza's distinctive application of Neoplatonism we find a clear parallel with the thought of Ebreo. The point that needs to be emphasized is that it is from the supreme intelligible that the finite modes of infinite substance derive their determination.

### 5. The intellectual love of God in Leone Ebreo

In the Neoplatonic scheme of Leone Ebreo, the One, in its infinite energy, sends forth a radiation that brings forth the second substance, the Intelligence. This in turn brings forth another, lesser being, the Soul. The Soul, unlike the Intellect, is capable of moving towards things other than itself. It too can contemplate itself; and, through the intermediacy of the Intelligence, it can recognize the light of the One. But when it produces a reflection of itself, the outcome is ■ still lower being, an animated body. In producing it, Soul acquires the desire and the power to incline towards it and provide for its sustenance. As a result Soul diverges from Intelligence.

Leone takes up the Neoplatonic formula: 'The soul is formed from the same and the other.' Its movement towards the intelligible is invisible. But its other movement is visible; it is the motive force of the physical. The human soul and the world soul are a mixture of spiritual intelligence and bodily change. Both are needed to animate body (III 179). Its movement, now towards the intelligible essences, now towards corporeal things, reveals the figure of the circle.

Following Plotinus,<sup>22</sup> Leone compares the intellect to the sun and the soul to the moon, the intermediary between the sun and the earth. The celestial comparisons that seem to fascinate him fit the taste of the time. They are found as well in Marsilio Ficino and Pico della Mirandola and recur often in the iconography of the Renaissance, in stained-glass windows, painting and sculpture.<sup>23</sup> Leone represents all the movements of the soul in terms of the relations of the moon to the sun and earth. The moon sometimes turns a lit-up face to the sun and darkness to the earth. Its light is borrowed. The soul similarly reflects the clarity of the intellect, and is now full of the light of the intellect, now deprived of it, but most often, a mixture of intellectual radiance and corporeal darkness. We shall not examine in detail Leone's comparison of the phases of the moon to the movements of the soul. But two examples should be given: When the soul is wholly preoccupied with matter and oblivious to contemplation, it is like the full moon, full of light for us earthdwellers, but full of darkness towards heaven. At the eclipse of the moon, the face of the moon, darkened by the interposition of the earth between moon and sun, corresponds to the loss of

consciousness of the soul. This occurs when sensuality places itself between the intellect and our soul. The soul loses all the light it receives from the intellect, not only in its superior part, but also in its inferior, active and corporeal part. It becomes comparable to the soul of wild beasts and brutes (III 194). It is no longer truly human.

Even in a solar eclipse the sun is never deprived of its light, as the moon can be; when the soul receives the light in its intellectual part only, and its lower part is wholly deprived of light, the body loses its being: "This is the happy death caused by the coupling of the soul with the Intellect, which our blessed ancestors Moses and Aaron tasted, as well as those of whom the Holy Scriptures speak saying that they died through the mouth of God by the kiss of God."<sup>24</sup>

Since Soul receives the light of Intellect, it too radiates and produces a reflection inferior to itself, the body it animates. If it inclines too far towards the body, soul can break away from its moorings and lose itself. But if it turns completely inward and towards its principle, it will reject the care of its body and endanger its survival. We find the source of Leone's analogy in Plotinus:

The First, then, should be compared to light, the next (Nous), to the sun, and the third (Psyche), to the celestial body of the moon, which gets its light from the sun. For Soul has intellect as an external addition which colors it when it is intellectual, but Intellect has it in itself as its own, and is not only light but that which is enlightened in its own being; and that which gives it light is nothing else but a simple light giving Intellect the power to be what it is.<sup>25</sup>

Leone has told us that the soul can turn in two different directions. How does it choose which way to turn? Here we confront the question of love. The cause of the changes of the moon lies in the local movement of the moon. But the ground for all the changes of the soul resides in the love inherent in it. Leone discerns a double aspiration of the soul. As an effect of the divine intellect it seeks the Beautiful beyond the sensible, and when it encounters intellectual beauty, it actively desires it: "It falls in love with this sovereign intellectual beauty, its higher source, as an imperfect woman falls in love with the man who makes her perfect." But the soul is also seized "by another love, linking the soul to the corporeal world

beneath it, like the love of the male for the female, seeking to make the corporeal world perfect, by imprinting on it the beauty which it derives from the Intellect by way of the first love."<sup>26</sup> This conception of twofold love echoes Plato's references in the *Symposium* to the heavenly and vulgar Aphrodite. By combining the two aspects of love, Leone seeks to protect what is unique in beauty, which is a reflection of what is above, and what is unique in that other love, which, even when it is led astray into carnal union, still finds a means to attain Form, drawn from above, to imprint it on matter:

just as the soul, made great by the beauty of the intellect, desires to engender it [this beauty] in the corporeal world and either gathers the seed of this same beauty to make it germinate in the body or, like an artisan, gathers specimens of intellectual beauty to sculpt them from life, in bodies.<sup>27</sup>

Since the love of the soul is twofold, it is sometimes more inclined toward intellectual beauty, to the point of leaving the body in "the happy death of coupling." But in other cases the opposite occurs. The soul is more inclined towards the body and loses sight of the higher beauty. Most often, however, reason comes to a compromise with sensuality, inclining perhaps towards the body or perhaps towards the intellect, as in the waxing and waning of the moon. Here one can differentiate the man who is merely chaste from the man who is temperate. Chastity is the lesser virtue. In temperance, the activity of the intellect can be discerned more clearly. Conversely, unchastity is a less serious fault than intemperance. Each soul must use its potentialities to work out what balance it will strike between the intellectual and the sensuous.

In such a scheme, does destiny depend on the external forces that bestow our faculties and sensibilities, or on ourselves? Does Leone leave room for individual freedom? All depends on his conception of God's love for his creatures. This love is not the recognition of a lack. Rather God's immense perfection makes Him love and desire his creatures, allowing them to reach the highest degree of their own perfection, and, once they possess it, to enjoy it eternally (III 215). Divine love is the principle that explains both creation and the sustenance of creation. Without love no father

would beget or provide for the preservation of his offspring. Similarly, no master would tirelessly impart science and wisdom to his pupil, and no friend would act to make another happy.

Man must pass through two stages to gain happiness: (a) the attainment of virtue and the moral life, and (b) the work of the understanding, dianoetic activity, which finds its highest fulfillment in contemplation. The first stage demands an asceticism which Leone depicts as a sequence like the phases of the moon. Only the temperate soul lives well. But virtue cannot be defined through temperance alone. Like Aristotle, Leone characterizes virtue as the exercise of a faculty or disposition appropriate to every situation, and as a means towards achieving the universal goal of felicity.

Every being belongs to a whole, and the perfection of the whole is the highest good (Dialogue Two, 162). But in realizing its proper perfection, every being serves the perfection of the whole:

It follows that the more the whole and the parts are perfect and happy, the more correctly and completely will they follow the duties to which they are subjected by the divine artisan. The ultimate end for all is the unified perfection of the whole universe, designed by the divine architect. So the aim of each part is not only the perfection of that part in itself, but that it thereby directly contribute to the perfection of the whole, which is the universal goal, the prime intent of the Deity. It is for this common goal, rather than solely for its own sake that each part was made, destined and dedicated. . . . So a part failing in such service, in acts pertaining to the perfection of the universe, would be more at fault and would become more unhappy than if it had failed in its own act.<sup>28</sup>

Virtue so understood has two main effects:

1. It contributes to the continued creation of the universe and to the order of the world as a whole:

Since our soul is only spiritual and intellectual, nothing occurring in the corporeal, ephemeral and corruptible state could benefit it more than its own pure intellectual act already does; but it applies to our body only for the love and service of the Sovereign Creator of the world, drawing life and knowledge and the divine light of the higher eternal world towards the inferior corruptible, lest this lower part of

the world be deprived of divine grace and eternal life, and so that this great animal shall have no part which is not alive and intelligent like the whole.<sup>29</sup>

2. Secondly, virtue maintains the existence of love in the world in both senses: both the yearning toward higher perfection and the impetus to give light to the lesser. The soul which is inclined towards the intellect that can perfect it has no less love for the body which it desires to perfect. Twofold virtue in the service of the whole sustains love in the world and thus strengthens the unity of the world:

For the more being there is in the world and the things in it, the more united and joined together are the world and all its members, like the limbs of an individual. Otherwise the disharmony would cause its total perdition. And just as nothing unites the universe with all its various realities, except love, it follows that this love is the cause of the being of the world and all its realities.<sup>30</sup>

Just as the soul must gain the ethical virtues to acquire happiness, it must make itself beautiful by the exercise of its intellectual faculties to open up the dianoetic way. There are two intellectual faculties: *dianoia*, which uses rational discourse to reach clear knowledge of the forms and their interrelations, and intellection:

The first "aspect" of the soul towards the Intellect is intellectual reason, with which it discourses by way of a universal and spiritual knowledge which abstracts the forms and intellectual essences from particular sensory bodies, constantly converting the corporeal world into the intellectual. The second "aspect," which is turned towards the body, is sense perception, particular knowledge of corporeal things.<sup>31</sup>

For each of these two ways of knowing a different form of love is engendered. The love of sensible things alienates the soul, by subjecting it to multiplicity. Only spiritual love leads man to happiness. The universal, spiritual knowledge of *dianoia* is assimilated to the world soul. For "all abstract forms in the unitive order are found spiritually in the world soul of which our rational soul is the image" (III 331). Thus discursive intelligence, using the

knowledge of the forms, attains comprehension of the ideal archetype, upon which the world is founded. As a result, the order of the universe is represented in our souls under the form of the ordered relations of the ideas. The highest degree of such intellection is intuitive intelligence, which is compared to the ineffable vision of the One, itself, the consummation of all rational knowledge.

That the intuition of the forms should be tantamount to the beatific vision is not surprising, for in the Divine Intellect we find the ideal essences of all things in a unique and perfect union:

The pure intellect which shines in us is at the same time the image of the pure divine Intellect, marked by the unity of all the ideas. At the end of all our discursive reasonings, it reveals the ideal essences in a unique and utterly abstract intuitive knowledge, when our well-trained reason so deserves.<sup>32</sup>

Leone adds:

Once we can see with the eyes of the intellect, we can see in one single intuition the sovereign beauty of the first intellect and the divine ideas: and seeing it we are delighted and we love it; and with the eyes of our rational soul, with its ordered discourse, we can see the beauty of the soul of the world and in it the whole system of forms whose beauty delights us again greatly and moves us to love.<sup>33</sup>

Before specifying how Leone envisages this intellectual love, we note his acknowledgement of the inequality of souls in attaining knowledge—a result of the unequal obedience of bodies to souls (III 329). Leone describes in Platonic terms the situation of souls which appear to enjoy corporeal beauties but fail to discern true beauty or formal grace, sensing only physical pleasure or utility. If in the end we find sensual pleasures or utilitarian profits inadequate, we have only the imperfection of our desires to blame. For sensuous pleasures rob us of higher goals that could bring real satisfaction, and sensuous desires disturb our quiet contentment by succumbing to "restless matter, the mother of sensory beauties" (III 332 f.). Leone stigmatizes those who favor lasciviousness, because they fail to find spiritual beauty in corporeal things. Such persons turn the accessory into the essential, prefer shade to light. At the end of the third

dialogue, Sophia is advised by her lover not to take delight, as Narcissus did, in a mere image of beauty, losing sight of the original, and drowning in its reflection. It is in the realization of our intellectual essence that the highest form of love occurs, when rational intuition grasps the essences latent in the divine wisdom.

The love of God for his sovereign wisdom is the primal love that produces the world, holding forth the first beauty, toward which the loving God draws in the first expression of love, through which the world was ordered out of chaos. But this primal love is identical with the love of creatures that leads this world to its final perfection. The perfection or virtue of a glass is that it is made in likeness to the form and design in the mind of the maker. But its final perfection is that it be used for the proper purpose for which it was made. We recognize here an Aristotelian distinction, applied by Leone to the universe at large.<sup>34</sup>

Sophia asks: "What then are the activities that contribute to perfecting the generated universe?" Philo answers that many such acts are found in the universe at diverse levels. The ultimate perfection is the most perfect, and the rest are only means of attaining it. These means are physical actions, but by rising through them to the purest intellectual acts one can discover and communicate to the world what leads to the ultimate perfection for the world. The highest of the intellectual acts is that of understanding, which has as its goal the divine essence and its sovereign wisdom,

For this level includes and comprehends every intellectual matter and every degree of intellection; and this is what can make the potential intellect wholly actual and the other produced intellects actual in the highest degree of their perfection?<sup>35</sup>

The ultimate perfection is achieved by means of three acts: thought, love, and unitive pleasure. Sophia asks Philo if thought uses any act other than understanding once it reaches love and unitive pleasure. Philo answers: "No, love at the intellectual level is in essence no different from thought itself." Love and intellection remain one, and it is only "according to reason" that they are distinct. Unitive pleasure is the highest and most perfect thought, because the more perfect an intellectual act is, the more perfect is the union of the intellect that understands and the matter understood.<sup>36</sup>

The intuitive knowledge of divine wisdom is love. For it is knowledge of the sovereign beautiful and good and this knowledge is as much a prerequisite of love as an outcome of it. Indeed, if it were the kind of knowledge that implies desire, this desire would disappear with the possession of the object and pleasure would not endure! But there is a love beyond desire, which has recognized its object and united with it. To understand this we must refer to an illustration that Leone uses as early as the first Dialogue: He who has no child longs for one; but he who has one does not desire one, but loves and enjoys the offspring he has. Another comparison is used in the third Dialogue:

A certain knowledge precedes the wish for food, but once the food has been enjoyed, the perfect knowledge of nourishment that is unitive, creates a love which is no longer caused by the lack of union, but by a desire to preserve it.

God's paternal love for his creatures, which corresponds to the order of production of the universe, is answered by "the reductive love" of his creatures resulting from the realization of their essence in virtue, the highest phase of which is intellectual virtue. The counterpart of the half-circle of loves from the Perfect to the imperfect is that which runs from the least perfect to the most perfect.<sup>37</sup> Leone's image of the circle from God to the least of creatures and back, by the road of love, to God in his supreme intelligible and intellectual perfection, like Marsilio Ficino's, was doubtless inspired by the Alexandrian mystics and such thinkers as Dionysius the Areopagite. Ficino writes:

If God fills the world with delight and the world is filled with delight by him, there is a certain continual attraction between God and the world which begins in God and passes through the world and finally ends in God, as a circle returns to where it began. So there is one single circle that runs from God to the world and from the world to God and is named in three ways: insofar as it begins in God and has power of attraction: beauty; insofar as it is transferred to the world and fills it with delight: love; insofar as it returns to the Creator and unites his works: delight. . . . And it is necessary that love is good: born from the Good, it will return to the Good.<sup>38</sup>

The circle represents the pattern of outflow and return, dear to all Neoplatonists. Marsilio says:

The Sovereign Creator, God, first created all things, secondly filled them with delight in himself, thirdly gave them perfection. God is therefore beginning, middle and end.

Leone takes over this formula almost completely. In union with the divine principle, we encounter the goal of all love. Indeed, without love and the yearning for sovereign beauty, it would have been impossible for things to emanate and become detached from the Deity. And it is precisely for this reason that love and the desire to return to their divine origin manifest themselves under the form of a desire for and a love of the beautiful which leads them toward their ultimate perfection.

Sophia, in the presence of this great conception, raises three objections:

1. How is it possible for delight to be the goal of intellectual love, since delight is a passion, and the intellect, being separated from the matter, is not susceptible to passions?
2. Can delight be the goal of productive love? Does it not seem impossible to rejoice while approaching the non-beautiful or the less beautiful?
3. Is it not difficult to admit that the love that leads the universe to its perfection is the reductive love of creatures for sovereign beauty, and not the productive love of God for the world He produced?

Leone answers:

1. Intellectual delight is not a passion in the intellect. Thus there can be a delight that is not a passion. It is an intellectual act and nothing else.
2. Delight can be the goal of productive love: God rejoices in His works, as many texts from the Torah confirm. True, neither sadness nor joy are found in God. But the delight here is "the agreeable fitness of the perfection of the effect, and the sadness is privation on the part of the effect."<sup>39</sup> Divine delight consists in the union of the not beautiful or the less beautiful with what makes them beautiful. It is not a union of the sovereign beautiful with the not beautiful or the less beautiful.

3. There is no difficulty in admitting that the love that leads the world and God to their perfection is the "reductive" love rather than "the productive love of God." For there is no beauty or perfection that does not grow when it is communicated; the fruit-bearing tree is always more beautiful than the sterile one.

The universe was produced by God "not just to keep it in its primal state of production but also and more truly to lead it to its ultimate perfection through its happy union with sovereign beauty."<sup>40</sup>

Indeed, there is no doubt that our eyes and visual powers with the desire of perceiving the light lead us to see the light and the body of the sun in which we rejoice. And their knowledge and enjoyment would not exist if our eyes were not at first illuminated by the sun and by the light.<sup>41</sup>

Our intellectual love, which is the highest form of love for the sovereign beauty in the universe and which leads us to unite with it, would never be capable of such a union "if our intellectual faculty were not assisted and illuminated by the sovereign beauty and by the love God has for the universe. It is this love that rouses and revives the love of the universe. It illuminates the intellectual faculty of the human soul to lead it to happiness in union with sovereign beauty."<sup>42</sup> Hence a true reciprocity is established between the "productive" love of God which conditions the order of existence and the "reductive" love which leads the universe and God himself to ultimate perfection. Here Leone Ebreo comes very close to Marsilio Ficino, who writes in the second book of *Letters*: "to be enraptured, you would never have desired it if He had not desired it." God's love for his creatures is the original force and the impetus that sustains each being and imparts the intelligence to understand and to love God.

Victor Delbos observes, "It is possible that Spinoza borrowed from Leone Ebreo and his *Dialogues of Love* his formula on the relation of knowledge and love, at the source of which we find Plato and Neoplatonism; but the formula was widespread in the language of the philosophers."<sup>43</sup> I think that Spinoza must have been struck by the pertinence of Leone's writing concerning the intellectual love of God, the objections of Sophia and the answers the Jewish philosopher gave to them. In the *Short Treatise* he wrote:

As man is in God together with all that is, he cannot have love for anything else, since all that is forms just one single thing, God himself. (chap. 14)

And in the *Ethics*:

God is free from passions, nor is he affected with any emotion of pleasure or pain (V, Prop. 17).

and

He who loves God cannot endeavor to bring it about that God should love him in return (V, Prop. 19).

Yet the difficulties adumbrated in such propositions are not insurmountable. Leone could aid Spinoza by showing that neither in God nor in a man who loves intellectually is love a passion, since it is the act of the intelligence. With this aid Spinoza can conclude the *Ethics* by stating that God does love Himself and man, since there necessarily exists in God an idea of His own essence and of all that necessarily follows from this essence (*Ethics* II, Prop. 3). This idea, constitutive in the infinite intellect, ensures that God knows Himself through an eternal and infinite mode of His thought. As a result, there can be a love of God for Himself. For the infinite perfection in which God conceives Himself goes hand in hand with the idea of Himself as cause of Himself and this perfection. But that formula, of course, answers to the definition of love. Thus: "God loves himself with infinite intellectual love" (*Ethics* V, Prop. 35).

As for God's love of man: every soul is defined as "the idea of a body." But insofar as our soul uses the knowledge of the second and of the third kinds, the soul understands itself as an eternal essence linked to the eternal essence of God, thus a part of the idea of God. Accordingly, one can understand the intellectual love of souls for God as a part of the infinite love of God for Himself (*Ethics* V, Prop. 36 and corollary).

Here once again we find the famous circle of Marsilio Ficino, but made more explicit by Leone Ebreo. It is through the elaboration of God's infinite essence that the soul exists as a finite mode. But it is only insofar as God can unfold Himself through the essence of

the human soul that he loves Himself. As Victor Delbos remarks: "There is truly no love of God for himself except insofar as finite beings, which are part of his Being, love him."<sup>44</sup> It would be right to add: insofar as these finite beings think of themselves *sub specie aeternitatis*, that is, in the light of the dependence of their essence on the essence of God. But in drawing this conclusion Leone lays the emphasis elsewhere. For after it has completed the dianoetic path, our intellection results in the intuition of our intimate union with God. If there is a kind of mysticism in Leone, it in no way represents a state which exceeds reason, unless on account of the joy or infinite delight of one who ultimately knows God.<sup>45</sup>

In Plotinus the ecstatic intelligence that conjoins with the One is a power the mind possesses eternally, although it seldom uses it: "because it is intelligence (*oti esti nous*) it contemplates the first principle, by means of what in it is not intelligence (*tō eautou mē nō*)." The full text is:

Since the substance generated [from the One] is form—one could not say that what is generated from that source is anything else—and not the form of some one thing but of everything, so that no other form is left outside it, the One must be without form. But if it is without form it is not a substance; for a substance must be some one particular thing, something, that is, defined and limited; but it is impossible to apprehend the One as a particular thing: for then it would not be the principle but only that particular thing which you said it was. But, if all things are in that which is generated [from the One], which of the things in it are you going to say that the One is? Since it is none of them, it can only be said to be beyond them. But these things are beings, and being: so it is beyond being. (*Enneads* V 5.6, Armstrong, 173)<sup>46</sup>

In Leone Ebreo we find nothing of this kind<sup>47</sup>—an intelligence that attains what is beyond itself and which contemplates the first principle by means of what in itself is not intelligence as such, does not exist. Still it is this conception which Proclus, in the footsteps of Plotinus, outlines in his *De providentia et fato*.<sup>48</sup> He calls this ecstatic intelligence the apophatic intelligence as opposed to the normal, cataphatic intelligence. It is Leone Ebreo's more rational and pertinent method of approaching ecstatic intelligence that, it seems to

us, renders his intellectualism much more marked than that of his predecessors in antiquity, and brings it nearer to that of a philosopher like Spinoza.<sup>49</sup>

# Notes

1. Leone Ebreo, *Dialoghi d'Amore: hebraeische Gedichte*, tr., Carl Gebhardt (Frankfurt a.M.: Curis Societatis Spinozanae, 1929), 55 ff., citing *Dialoghi*, I, 26a-b. This edition is a revision of Leone Ebreo, *Dialoghi d'amore, poesie hebraiche*, Ristampati con introduzione di Carl Gebhardt (Heidelberg: C. Winter; Gravenhage: Nijhoff; London: Oxford University Press, 1924). We have also consulted Léon Hébreu, *Dialogues d'amour* (Lyon, 1551; tr. Pontus de Tyard) ed. T. Anthony Perry (Chapel Hill: University of North Carolina Press, 1974), which is of particular interest for its introduction. The Italian edition of Ebreo's work to which we refer throughout is the Santino Caramella edition of *Dialoghi d'amore* (Bari: Laterza e figli, 1929). Beyond its well known influence on such diverse figures as Montemayor, Giordano Bruno, Cervantes, Spinoza and Schiller, Leone Ebreo's *Dialoghi d'Amore* has enjoyed a relatively recent resurgence of interest, judging from the translations in Spanish, German, English and Hebrew and re-edition in Italian. E. Friedberg-Sceley and J. H. Barnes translated it into English as *The Philosophy of Love* (London, 1937); this was not available to me in Belgium, and the translations here are my own. The classic study was H. Pflaum, *Die Idee der Liebe* (Heidelberg, 1926); cf. now Suzanne Damien, *Amour et Intellect chez Léon l'Hebreu* (Toulouse: Edouard Privat, 1971) and Alfred Ivry's splendid "Remnants of Jewish Averroism in the Renaissance," in B. Cooperman, ed., *Jewish Thought in the Sixteenth Century* (Cambridge: Harvard University Press, 1983), 243-65. Ivry shows the infusion of Averroian and Averroist thought (distinguishing the thought of Averroes from that of his interpreters) not only in works of admitted and obvious disciples but also in the compositions of their major intellectual adversaries, the Platonists of the period.
2. Suzanne Damien, *Amour et intellect chez Léon l'Hebreu*.
3. *Dialoghi* III 385 f.
4. See Gershom Scholem, *Les origines de la kabbale* (Paris: Payot, 1966), 165. Similarly, according to the ancients (probably the Kabbalists), "le juste rend la splendeur divine parfaite, et elle est par le méchant tachée" (144). The world is perfect, not sinful. From this we might infer that God's love is not diminished by its manifestation

- in the world but preserved, so that the world remains in some sense divine or an expression of the divine.
5. II 162-63: "Tu hai altra volta inteso da me, o Sofia, che tutto l'universo è un individuo, cioè come una persona, e ognuno di questi corporali e spirituali, eterni e corruttibili, è membro e parte di questo grande individuo, essendo tutto e ciascuna de le sue parti prodotta da Dio per uno fine commune nel tutto, insieme con uno fine proprio in ognuna de le parti. Séguita che tanto il tutto e le parti sono perfetti e felici, quanto rettamente e interamente conseguono gli offizi ai quali sono indirizzati dal sommo opifice. Il fine del tutto è l'unita perfezione di tutto l'universo, disegnata dal divino architetto, e il fine di ciascuna delle parti non è solamente la perfezione di quella parte in sé ma che con quella deservia rettamente a la perfezione del tutto, che è il fine universale, primo intento de la divinità." Cf. Maimonides, *Guide* I 72, II 10. Maimonides called the indirect way through which nature attains its goals a "gracious ruse" of God and his wisdom; he may have taken the expression from Alexander of Aphrodisias' *Principle of the All* (extant only in Arabic translation; see A. Badawi, *La Transmission de la philosophie grecque en monde arabe* (Paris: Vrin, 1968); J. M. Rist, "On tracking Alexander of Aphrodisias," *Archiv für Geschichte der Philosophie* 48 (1966): 82-90; J. van Ess, "Über einige neue Fragmente des Alexander von Aphrodisias . . .," *Der Islam* 42 (1966): 149-54; F. W. Zimmermann and H. V. B. Brown, "Neue arabischen Übersetzungstexte aus dem Bereich der spätantiken Griechischen Philosophie," *Der Islam* 50 (1973): 313-24; P. Thillet, "Un traité inconnu d'Alexandre d'Aphrodise sur la Providence dans une version arabe inédite," *Actes du 1er Congrès international de philosophie médiévale* (Louvain, 1960). The idea is suggestive of Hegel's "cunning of Reason."

See also *The Cosmographia of Bernardus Silvestris*, tr., Winthrop Wetherbee (New York: Columbia University Press, 1973); see also Brian Stock, *Myth and Science in the Twelfth Century: A Study of Bernard Silvester* (Princeton: Princeton University Press, 1972).
  7. II 162: "In questo alto debbe consistere la sua felicità e il suo ultimo fine, non in muover corpo celeste che è cosa materiale e alto estrinseco de la sua vera essenza."
  8. The view that sperm is produced by the entire body is found in the *Zohar*, II 150 b, 82, tr. H. Sperling, M. Simon and P. Leverhoff (London, 1933-34), 5 vols.; *Sepherha Zohar (Le livre de la splendeur) Doctrine ésotérique des Israélites*, tr., Jean de Pauly, ed., Émile

- Lafuma-Giraud (Paris: Leroux, 1906-1911), 6 vols; *Le Zohar*, tr., Charles Mopsik, (Albertville: Verdier, 1981). See also Gershom Scholem, *Les grands courants de la mystique juive* (Paris: Payot, 1960); *Jewish Gnosticism, Merkabah Mysticism, and Talmudic tradition* (New York: JTS, 1960); *Zur Kabbala und ihrer Symbolik* (Zürich: Rhein-Verlag, 1960); Z'ev ben Shimon Halevi (i.e., Warren Kenton), *Adam and the Kabbalistic Tree* (London: Rider, 1974) and François Secret, *Le Zohar chez les kabbalistes chrétiens de la Renaissance* (La Haye: Mouton, 1964).
9. See the important passage on Avicenna and Averroes in the *Dialoghi*, ed., Caramella 283-85, corresponding to 231-39 in the Anthony Perry ed. of the French translation of Pontus de Tyard (1551). That the active intellect is the lowest of the angels was maintained in Italy by such Jewish Neo-Aristotelian philosophers as Yehudah Romano (b. 1292). Its identification with God was defended especially by Christians, including Thomas Aquinas. See Joseph B. Sermoneta, *La dottrina dell' intelletto e la "fede filosofica" di Jehudah e Immanuel Romano* (Spoleto: Ateneo, 1965). On intellection in Leone, see Suzanne Damians.
  10. Alexander of Aphrodisias, *On Fate*, ed. and tr., R. W. Sharples (London: Duckworth, 1983); *Traité du destin*, ed., Pierre Thillet (Paris: Belles Lettres, 1984); Paul Moraux, *Der Aristotelismus bei den Griechen, von Andronikos bis Alexander von Aphrodisias: Die Renaissance des Aristotelismus* (Berlin: De Gruyter, 1973).
  11. *Enneads* V 9.3; Armstrong 5.293.
  12. *Guide* III 2.
  13. *Enneads* V 9.5; Armstrong 5.299. This passage affords an excellent example of Plotinus' practice of collecting texts of varied significance in their original contexts to support his own doctrine: Cf. Parmenides frg. B3, Diels; Aristotle *De anima* III 4, 430a 3-4 and 7, 431a 1-2; Heraclitus frg. B101, Diels; and (for example) Plato, *Phaedo* 72E 5-6.
  14. Alexander Altmann credits this doctrine to the Islamic Aristotelians, and credits Maimonides (*Guide* I 68; *Hilkhot Yesodei-ha-Torah* 2.10) for its currency among Jewish philosophers; see his "Moses Narboni's Epistle on Shi'ur Qoma," *Jewish and Medieval Renaissance Studies* 4, ed., A. Altmann (Cambridge: Harvard University Press, 1967), 265. Cf. Carl Gebhardt, 55 f.: "Mit dieser Lehre von Der Identität Gottes und der Welt als des göttlichen Denkinhalts steht Leone in der Tradition jüdischer Philosophie. Aus des Aristoteles Bestimmung der Gottheit als der noesis noeseos (Metaph. XII, 9) hatten die arabischen Peripatetiker den Satz geformt: Gott ist das Denken, der Denkende und das Gedachte. Ihnen folgend lehrt Abraham ibn Esra im 12.

- Jahrhundert: Er ist allein Verstehender, Verstand und Verstandenes, und im 13. Jahrhundert übernimmt Maimonides die Identitätslehre in de *Yesodè-ha-Torà* un den *More Nebukhim*: Er ist Verstand, Verstehendes und Verstehbares und diese drei sind in Gott nur ein und dasselbe Ding, in dem es keine Vielheit gibt, und er findet die Einheit nicht nur im Schöpfer, sondern in jedem actualisierten Verstand. Auch die Mystiek der Qabbala hat sich die Identitätslehre nicht entgehen lassen; im 16. Jahrhundert ist Mose Corduero ihr Vertreter. Und wie die Mystik des Mittelalters in Meister Eckhart das Auge darin ich Gott sehe, in eines setzt mit dem Auge, darin mich Gott siehet, so kündigt Leone die gleiche Identität: Der Verstehende, das Verstandene und der Verstand sind geschieden, sofern sie potentiell sind, und sind vereinigt, sofern sie aktuell sind (III, 57a). In Gott ist der Erkennende und das Erkannte und die Erkenntnis selbst alles ein und dasselbe." (III, 56a. References to editio Carl Gebhardt: Heidelberg, 1924).
15. *Ethics* V, Prop. 29, scholium, tr., after E. Curley, *The Collected Works of Spinoza* (Princeton: Princeton University Press, 1985), 610.
  16. *Ethics* V, Prop. 42; cf. *Short Treatise* II, Ch. 26.
  17. *Le Spinozisme* (Paris: Vrin, 1916), 171. Such a reading might encourage the notion that because Spinoza writes *more geometrico* he must conceive human life as a geometric deduction. But *Short Treatise* II, ch. 26 shows how aware Spinoza was of the human moral drama; and when he says there are no demons but only our own weaknesses, he echoes Heraclitus' *ethos anthropoi daemon*—hardly a cold or overly monistic point.
  18. Of this Victor Delbos asks if it is not the imperfect substitute, but a substitute nonetheless, for the idea of predestination, *Le Spinozisme*, 166 ff.
  19. Léon Brunschvig, *Spinoza et ses contemporains* (Paris: Alcan, 3rd edition, 1923); see also his "Le Platonisme de Spinoza," *Chronicon spinozanum* 3 (1923).
  20. *Ethics* III, Prop. 6, 7; cf. Def. 6; IV, Props. 3, 5.
  21. *Ethics* II, Prop. 45.
  22. "Again, just as in the number two there is a one and another, and it is not possible for this one with another to be the number one, but it is necessary for there to be a one by itself before the one with another; in the same way it is necessary that, when a thing has immanent in it something simple along with something else, the simple thing should be simple in and by itself, having nothing in itself of all that it has in its association with other things. For what could make it something else in something different, if there was not something before it from which this something else comes? For the simple could not derive

- from something else, but that which is many, or two, must itself depend on something else." *Enneads* V 6.4; Armstrong, 5.209.
23. Cf. Edgar Wind, *Pagan Mysteries in the Renaissance* (London: Faber and Faber, 1968) and *Le soleil à la Renaissance: Science et mythes* (Bruxelles, Paris: Presses universitaires de Bruxelles/Presses universitaires de France, 1965) the proceedings of a colloquium held in April 1963 which include Francesco Negri Arnoldi, "L'iconographie du soleil dans la Renaissance italienne," 519-38, and Francois Secret, "Le soleil chez les kabbalistes chrétiens de la Renaissance," 211-40. See also George Francis Hill, *A Corpus of Italian Medals of the Renaissance before Cellini* (London: British Museum, 1930).
  24. III 19: "E questa è la felice morte che causa la coppulazione de l'anima con l'intelletto, la quale hanno gustata i nostri antichi beati Moisé e Aron, e gli altri de quali parla la sacra Scrittura che morino per bocca de Dio baciando la divinità (come t'ho detto)."
  25. *Enneads* V 6.
  26. III 195: "(l'anima) . . . s'innamora di quella somma bellezza intellettuale sua superiore origine, come s'innamora la femmina imperfetta del maschio suo perficiente, e desidera farsi felice ne la sua perpetuata unione. Con questio si giunta un altro amore gemino de l'anima al mondo corporeo a la inferiore, come del maschio a la femmina, per farlo perfetto imprimendo in lui la bellezza che piglia da l'intelletto mediante il primo amore."
  27. III 195: ". . . come che l'anima, ingravidata de la bellezza de l'intelletto la desidera parturire nel mondo corporeo, o veramente piglia la semenza di essa bellezza per farla germinare nel corpo, ovvero come artifice piglia l'esempli de la bellezza intellettuale per sculpirli al proprio ne'corpi."
  28. II 163: "Séguita che tanto il tutto e le parti sono perfette e felici, quanto rettamente e interamente conseguono gli offizzi ai quali sono indirizzati dal sommo opifice. Il fine del tutto è l'unita perfezione di tutto l'universo, disegnata dal divino architetto, e il fine di ciascuna delle parti non è solamente la perfezione di quella parte in sè, ma che con quella deserva rettamente a la perfezione del tutto, che è il fine universale, primo intento de la divinità. E per questo comun fine, più che per il proprio, ogni parta fu fatta, ordinata e dedicata. Talmente che, mancando parte di tal servitù negli atti pertinenti a la perfezione de l'universo, le sarebbe maggiore difetto e più infelice verrebbe a essere, che se li mancasse il suo proprio atto."
  29. II 164: "Ché l'anime nostre essendo spirituali e intellettive, nissun bene da la società corporea, fragile e corruttibile lor potrebbe occorrere, che non stessero molto meglio col sua atto intellettivo intrinseco e

- puro; ma s'applicano al nostro corpo solamente per amore e servizio del sommo creatore del mundo, traendo la vita e la cognizione intellettuale e la luce divina dal mundo superiore eterno a l'inferiore corruttibile, acciò che questa più bassa parte del mondo non sia anch'ella priva de la grazia divina e vita eternale, e perché questo grande animale non abbia parte alcuna che non sia viva e intelligente come tutto lui."
30. II 165: "Però che tanto il mondo e le sue cose hanno essere, quanto egli è tutto unito e collegato con tutte le sue cose a modo di membra d'uno individuo: altrimenti la divisione sarebbe cagione de la sua totale perdizione; e siccome niuna cosa non fa unire l'universo con tutte le sue diverse cose, se non l'amore, séguita che esso amore è causa de l'essere del mondo e di tutte le sue cose."
  31. III 331: "La prima faccia, verso l'intelletto, è la ragione intellettuale, con la quale discorre con universale e spirituale cognizione, estraendo le forme ed essenzie intellettuali da li particolari e sensibili corpi, convertendo sempre il mondo corporeo ne l'intellettuale; la seconda faccia, che è verso il corpo, è il senso, che è cognizione particolare de le cose particolari corporee, aggiunta e mista la materialità de la cose corporee conosciute."
  32. III 326: "E il puro intelletto che riluce in noi è similmente immagine de l'intelletto puro divino, disegnato de l'unità di tutte le idee, il quale in fine de'nostri discorsi razionali ne mostra l'essenzie ideali in intuitiva unica e astrattissima cognizione, quando il merita nostra bene abituata ragione."
  33. III 326: "Si che noi con gli occhi de l'intelletto possiamo vedere in uno intuito la somma bellezza del primo intelletto e idee divine: vedendola ne diletta, e noi l'amiamo; e con gli occhi de l'anima nostra razionale con ordinato discorso possiamo vedere la bellezza de l'anima del mondo e in lei tutte l'ordinate forme, la quale ancora grandemente ne diletta e move ad amare."
  34. III 372: "Così ne l'universo prodotto il primo fine del produttore e la prima perfezione di quello consiste ne la perfezione de l'opera divina, essendo proprio simulacro de la divina sapienza, ma l'ultimo fine suo e l'ultima perfezione di quello consiste in esercitarsi esso universo ne l'atto e opera per il quale fu prodotto, il quale è fine di esso operato però che l'essere de l'operato è fine de l'operante, e l'opera de l'operante è fine de l'esser suo."
  35. III 373: "Però che in questo (come già altrove t'ho detto) consiste e si comprende ogni cosa intellettuale e ogni grado d'intellezione; e questo è quello che può ridurre l'intelletto possibile secondo tutta la sua essenza in intero atto, e gli altri intelletti prodotti attuali nel sommo

- grado de la sua perfezione."
36. III 374: "Però che quanto più perfetto è l'atto intellettuale, tanto è maggiore e più perfetta l'unione de l'intelletto intendente e de la cosa intelletta."
  37. For a clear analysis of the grand reconciliation of these opposites in cyclical activity and of the final synthetic vision that crowns the *Dialoghi*, see *Dialogues d'amour*, tr., Pontus de Tyard, Perry, Introduction, 22 ff.
  38. Quoted in Festugière, *La philosophie de l'amour de Marsile Ficin et son influence sur la littérature française* (Paris: Vrin, 1947), 34.
  39. III 383: "Ma in effetto nè la tristezza nè la letizia son passione in lui, ma la dilettaione è grata corrispondenza de la perfezione del suo effetto e la tristezza privatione di quella da la parte de l'effetto."
  40. III 384: "Però che non è alcuna perfezione nè bellezza che non cresca quando è comunicata ché l'arbore fruttifero sempre è più bello che l' sterile, e l'acque emananti e correnti fuora sono più degne che le raccolte ■ ritenute in le sue vivagne. Prodotto l'universo, fu prodotto con lui l'amore di Dio a esso, come del padre nel figlio già nato: Il qual non solamente fu per sostentarlo nel primo stato de la sua produzione, ma ancora e più veramente per condurlo ne la sua ultima perfezione con la sua felicitante unione con la divina bellezza."
  41. III 384: "Non è dubio che li nostri occhi e virtù visiva col desiderio di sentire la luce ne conduce a vedere la luce e corpo del sole, nel quale ci dilettiamo: niente di manco, se gli occhi nostri non fussero prima illuminati da esso sole e da la luce, noi non potremmo mai arrivare a vederlo, però che senza il sole impossibile è che il sole si veda, perche col sole il sol si vede."
  42. III 385: "Né l'amor nostro né suo sarieno mai capaci di simile unione, né sufficienti di tanto alto grado di dilettevole perfezione, se non fusse la nostra parte intellettuale auitata e illuminata de la somma bellezza divina e de l'amore che esso ha a l'universo; quale avviva e solleva l'amore de l'universo illuminando la parte sua intellettuale, acciò che l' possa condurre a la felicità unitiva de la sua somma bellezza."

45. Cf. the idea of rational mysticism in L. E. Goodman, Ibn Ṭufayl's *Ḥayy Ibn Yaqzān*, 30-49.
  46. Cf. Plato *Republic* VI 509: "The Sun, I presume you will say, not only furnishes to visibles the power of visibility but it also provides for their generation and growth and nurture though it is not itself generation. . . . In like manner, then, you are to say that the objects of knowledge not only receive from the presence of the good their being known, but their very existence and essence is derived to them from it, though the good itself is not essence but still transcends essence in dignity and surpassing power," tr., Paul Shorey.
  47. As Goodman suggests, it is not impossible that the sense of hunger and lack Leone speaks of corresponds to this, and so to Diotima's genealogy of love in the *Symposium* as an offspring of *poros* and *penia*. But we must remain cautious here. The opening statement of the *Dialoghi* places the entire work under the sign of a Platonic and rationalistic theory of love. Love (like desire) is always based on knowledge. If love is based on knowledge, the latter in turn can only be of what is; the beloved object must have real existence. The proposition that love expresses a relationship between a subject and an object both real and lovable rigorously follows Socrates' own conclusions in the *Symposium* (200c-201b). Socrates' further observation that one can love or desire only what one does not have, however, seems unacceptable or at least requires clarification. The objection is raised by the quick-witted Sophia apparently to divert the ardor of her suitor's bold opening declaration: How can Philo claim to feel both love and desire? Philo counters with the example of a man's affection for his wife, which may be described as both love and desire.
  48. Proklos Diadochos, *Über die Vorsehung, das Schicksal und den freien Willen an Theodoros, den Ingenieur (Mechaniker)*, ed., Theo Borger, tr., Michael Erler (Meisenheim am Glan: Anton Hain, 1980).
  49. Love is seen as following upon knowledge and stimulating it in turn. Love and desire are means of raising us from imperfect knowledge to the perfect union which is their true end. For the reciprocal relation of love and knowledge, see Ivry's essay, cited above, n. 1. Analyzing Ebreo's remark, "As we know His perfection, so we love and enjoy Him in the most perfect union of knowledge possible to us," Ivry

comments: "The phrase 'possible to us' is a conventional qualification expressing the concern to maintain God's transcendence, a belief Ebreo holds in uneasy alliance with the conviction of His immanence. . . . Ebreo goes further towards uniting man directly with God than do most medievals. Once he even identifies God with the Agent Intellect of our World, its formal principle, with which individual intellects may conjoin" (247).

## Spinoza, Neoplatonic Kabbalist?

Richard Popkin

In the first history of the Jews written after Josephus, the French Huguenot Jacques Basnage wrote, "There is among the *Jews* a third Opinion about the Creation, which Spinoza has reduced to a System. In truth that *Jew* had borrow'd the foundation of his Iniquity from the Rabbis of his Nation, who were known to him; rather than the *Chineses*,<sup>1</sup> or the Heathen Philosophers. He has never cited the *Cabalists* as his Vouchers, because that Man was so extreemly jealous of the immortality of his Name, that he designed to pass for an Original, and an Inventor of his Opinions. The *Cabalists*, no less greedy of glory than *Spinosa*, might have claimed a Discovery which belonged to them, and gloried in that which has made *Spinosa* immortal; but his Name was become too odious to enter into a Society of Atheism with him. In short the *Jews* rose up against him."<sup>2</sup>

Basnage went on, "The *Cabalists* for this long time have been as it were allow'd and authorized to throw about their Extravagances, and make themselves to be admired by some Persons who love to run after shadows and trifles, things of nought: But this comes about by their having the Art and Dexterity to veil themselves under a Mystical Language. They produce their Dreams and Visions as Explications of Scripture, and spiritual Conjectures rather than as decisions of Faith. *Spinosa*, on the contrary, has made a System, and has endeavoured to prove it. He has kept very well to part of the obscure and Mystical Language of the *Cabalists*, and therefore those

who confute him are often accused of not understanding him; and his Disciples affirm, that all those who have attacked him, have not thoroughly comprehended his true thoughts."<sup>3</sup> Spinoza, Basnage insisted, was a disciple of the Cabalists, had taken his principles from them, but went further than they did until he undermined the foundations of Judaism.

This strange interpretation of Spinoza is similar to one that appears in another work of the time, *Den Spinozismus im Judenthums, oder, die von dem heutigen Judenthumb und desen Geheimen Kabbala (Spinoza and Judaism, On Present Day Judaism and the Secret Kabbala)*, by Johann Georg Wachter.<sup>4</sup> Considering that Spinoza is usually seen as the most rational and non-mystical of philosophers, and one who treated Kabbalistic readings of Scripture with complete disdain, it does seem, *ab initio* implausible that Spinoza was a secret Kabbalist, who drew his philosophical system from the mystical one of the Kabbalists. In fact, Spinoza said, "I have read and known certain Kabbalistic triflers, whose insanity provokes my unceasing astonishment."<sup>5</sup> What I shall try to do in this paper is to explore why such an interpretation was offered by two serious intellectuals in the generation after Spinoza, and whether there may have been any justice in their reading of Spinoza.

By now we all know that Spinoza developed his views from Cartesianism, rational Jewish medieval thinkers, and from Renaissance Neoplatonists like Leone Hebreo. What is so obvious now that Spinoza has been put in his place by the German idealist historians of philosophy and by scholars of Jewish intellectual history, was not so obvious when Spinoza's *Opera Posthuma* was published in 1677. The central work, *The Ethics demonstrated by geometrical method*, gave no clue as to what tradition it came from or how one was supposed to read it.<sup>6</sup> Spinoza had published only two seemingly unrelated works previously, *The Theological-Political Tractatus* and *The Principles of Descartes' Philosophy*.<sup>7</sup>

Forty years earlier, when Descartes produced his strikingly novel works, *The Discourse on Method* and *Meditations on First Philosophy*, the author was alive and only too willing to explain to anyone interested what was revolutionary and true in his philosophy. So Descartes left us a large legacy of published and epistolary explanations and justifications of his views.<sup>8</sup> Spinoza unfortunately

was dead when the *Ethics* was published. The few letters printed by his disciples provided scant explanation of the majestic work. Spinoza's radical friends, who accepted his attacks on established religion, like St. Evremond, Col. J.-B. Stoupe and Henriquez Morales (Henri Morelli), just indicated that they agreed with him.<sup>9</sup> Others who had discussed and disputed Spinoza's early views, like Henry Oldenburg, the secretary of the Royal Society, gave no guidance about the import of *The Ethics*. Leibniz, who had apparently leaned towards Spinoza's views, shied away from association with them as soon as they were denounced. The early reading was that Spinoza was "the first to reduce atheism to a system"<sup>10</sup> or that as a consistent Cartesian he perforce became an atheist.<sup>11</sup> Clearly he was exotic, perhaps some kind of Oriental philosopher.<sup>12</sup>

Bayle and Spinoza's early biographer, Colerus, had portrayed the heroic Spinoza as a bright Jewish lad who could not abide the rigidity and aridity of the Synagogue school. He got himself expelled, then studied Latin, read Descartes, became a Cartesian, and, as Henry More might have predicted, by being consistent, became an atheist.<sup>13</sup> This picture of Spinoza's development was to become the standard one in the histories of philosophy of the eighteenth and nineteenth centuries.

It is, of course, difficult to put oneself back into the intellectual world of the late 1670s and early 1680s, when Spinoza became an important figure. He provided no introductory material, no intellectual biography. He left no disciples who were ready and able to explain it all. The situation would have been analogous to the appearance of Ludwig Wittgenstein's *Tractatus Logico-Philosophicus* without Bertrand Russell's preface. (The fact that so many publishers turned down Wittgenstein's masterpiece *before* Russell wrote the preface indicates the problem.) How would Spinoza's contemporaries have known what to make of the strangely presented text or what school of philosophy to put it in? The difficulty in assessing what Spinoza was up to, even when there were living students and contacts of Spinoza to ask for guidance, is attested by Bayle's enormous article on "Spinoza" in the *Historical and Critical Dictionary*.<sup>14</sup> Where would a contemporary look for some explanation? The texts of Basnage and Wachter show that they looked in a work published

the same year, the *Kabbala Denudata*, and accepted the clues offered by a strange figure, Moses Germanus.

The *Kabbala Denudata*, an immense compilation and Latin translation of major Zoharic and Lurianic Kabbalistic texts, with explanations and discussions, was put out by Christian Knorr von Rosenroth (1636-1689), a mystical Christian Kabbalist and follower of Jacob Boehme. He studied the Hebrew language and Jewish texts with rabbis in Amsterdam and obtained from them many manuscripts of works of Isaac Luria and his followers, including many that had not been published in any language. Gershom Scholem mentions one manuscript which is now known only through Knorr von Rosenroth's Latin translation.<sup>15</sup> The manuscripts were published in the *Kabbala Denudata* in two volumes, in 1677 and 1684.<sup>16</sup>

The editing and translating was done by Knorr and some of his friends such as the Cambridge Platonist Henry More; More's student, Lady Anne Conway; her doctor, Francis Mercurius van Helmont; their Rabbinical consultant, Isaac Abendana, then reader in Hebrew at Cambridge; and Moses Germanus. The last was a Catholic student of the Jesuits who became a Pietist associate of the Protestant leader Jacob Spener and then converted to Judaism, becoming rabbi of the Spanish-Portuguese Synagogue in Amsterdam, and leader of a new Messianic movement after the collapse of the Shabtai Zvi movement in Holland.<sup>17</sup>

The declared purpose of the *Kabbala Denudata* was to make the Kabbalistic texts, especially the newer Lurianic ones, available to Christian Europeans. Learned Christians would then see what wisdom and enlightenment were to be found there. As Henry More had remarked, "there is pretious gold in this Cabbalisticall rubbish."<sup>18</sup> Further, making these texts more widely known would help in the great Millenarian mission of converting the Jews, by making their secret books available, and thus enabling right-minded Christians to show Jews that the inner message of their Kabbalistic books is that of Christianity. Knorr von Rosenroth makes it clear from the beginning to the end of the *Kabbala Denudata* that the work serves as an important part in a program to convert the Jews, as a prelude to the Millennium. Thus the last item in volume 2 is a brief tract by Van Helmont on the *Christian Kabbalah*, spelling out the view that the application of the doctrines of the Hebrew Kabbalists

will help lead to the conversion of the Jews.<sup>19</sup> Knorr von Rosenroth's achievement was used by European Christians for about two centuries. Locke, Newton and Leibniz, among others, all knew it. The German idealists used it, and it was partially translated into English.<sup>20</sup>

Since volume 1 of the *Kabbala Denudata* and Spinoza's *Opera Posthuma* appeared in the same year, many prominent intellectuals read both. Although it has not yet been investigated, Knorr von Rosenroth and Spinoza must have had quite a few friends or discussants in common. They both knew Leibniz. Knorr was involved with the Behmists in the Netherlands, a group that included at times Van Helmont, Peter Serrarius, Benjamin Furly, Adam Boreel and other radical Protestants who also knew and associated with Spinoza. Spinoza's publisher also published the works of Jacob Boehme and his disciples. So some of the same people would have read Spinoza, Boehme, and the work of their friend and associate Knorr von Rosenroth.

Even before Moses Germanus pointed it out, some readers must have noticed a striking similarity between Part I of Spinoza's *Ethics* and the first chapters of the Latin abridgement of Abraham Cohen Herrera's *Gate of Heaven*, which appeared as an appendix in volume 1 of the *Kabbala Denudata*. Abraham Cohen Herrera (ca. 1570-1635 or 1639), born Alonso Nunez de Herrera in Florence, was the scion of a prominent New Christian family who lived as Catholics in Florence and Venice, doing international business for the Duke of Tuscany and the Sultan of Morocco. The son apparently mastered the Florentine Neoplatonism of Ficino and Pico and studied the Kabbalah with a disciple of Isaac Luria, Israel Sarug, at Dubrovnik. Herrera became an agent for the Sultan of Morocco, went to Spain on business for him, and was captured by the English in the Earl of Essex's raid on Cadiz in 1595. He languished under house arrest in England for a few years until released as a result of pleas by the Sultan. Some time later, Herrera went to Amsterdam, where he was one of the first members of the Sephardic Jewish community that came together there. He died in Amsterdam in the mid-1630s, when Spinoza was very young.<sup>21</sup> His great work, *Puerta del Cielo*, written in Spanish, was not published in the original, but a Hebrew translation by one of Spinoza's teachers, Isaac Aboab, was published

in 1655, and Knorr von Rosenroth abridged the Hebrew text and translated and published it in Latin in 1677-78.<sup>22</sup>

Herrera set out first to formulate the message of Lurianic Kabbalism in the Neoplatonic idiom. The first several chapters contain no peculiarly Hebrew terms or concepts but lay out the underlying philosophical basis of Lurianic Kabbalism in didactic and demonstrative form. Much of the first part of the text might be interchangeable with portions of Spinoza's first book of the *Ethics*. This is not to say that Spinoza read Herrera. He could have read the Hebrew translation, he could have heard of it in school, he could have learned of it from someone like Knorr von Rosenroth. Or he could have worked out independently a similar Neoplatonic theory of the nature of God and the relation of all kinds of existence to God. It has been suggested by Dunin-Borkowski, a leading Spinoza scholar, that Spinoza did know Herrera's work. Others have questioned this claim.<sup>23</sup> But whether Spinoza knew of Herrera's writings or learned from them, his work was immediately associated with Herrera's ideas. Moses Germanus, Wachter and Basnage all cite similarities.

Gershom Scholem discussed Wachter's interpretation at length in his introductory essay to the German translation of Knorr von Rosenroth's Latin condensation of Herrera's work, and more briefly in his last public lecture at the 1984 Spinoza Symposium at Wolfenbüttel.<sup>24</sup> But Wachter, in fact, mainly dealt with the views of Moses Germanus on Spinoza, on Judaism, on pagan religion, and with the views of Herrera. He said very little about Spinoza, despite his title.<sup>25</sup> Basnage, who is mentioned only in passing by Scholem,<sup>26</sup> has not been examined thoroughly, but his discussion is much more detailed in relating Spinoza's views to those found in the *Kabbala Denudata*.

Basnage devoted thirty pages to Spinoza in the fourth book of his *Histoire des Juifs*, arguing for the true, Kabbalistic origin of Spinozism.<sup>27</sup> Basnage began with Spinoza's view that there is in the universe only a unique substance, God, and that all other beings are only modifications of this. For a substance cannot engender another substance, and nothing can be created out of nothing. *Ex nihilo nihil fit*, Basnage said, was a principle borrowed from the Kabbalists.<sup>28</sup> Those who deny it, according to the Kabbalists, we are told, oppose not only reason but the wisdom and power of God.

A reference is given here to Henry More's *Fundamenta Cabbalae*, which appears in volume 2 of the *Kabbala Denudata*.<sup>29</sup> Basnage was well aware that the *ex nihilo nihil fit* doctrine was articulated by the Epicureans, but he claimed it was taken over by others, including the Kabbalists.

Spinoza's principle that there is only one substance, agrees with the teaching of the Kabbalists, except that Spinoza made this substance material, while for the Kabbalists it is spiritual.<sup>30</sup> Basnage contended, however, that both views came down to the same thing—that there is only one substance, and everything is a modification of it. Basnage again cited More as his authority for saying this.<sup>31</sup> The difficulties for Spinozism will be greater than in "la Theologie Cabbalistique," but both systems will have problems explaining how anything other than the one substance exists.<sup>32</sup> Basnage went on to explore the Kabbalistic Neoplatonic emanation theory and Spinoza's notion of modes. After showing how strange and blasphemous Spinoza's theory could become, Basnage restated his thesis that the foundations of Spinozism lie in Kabbalistic theology: All that Spinoza had done was to dress it up in Cartesian terms, leading to his materialistic characterization of the one substance.<sup>33</sup> Basnage preferred the Kabbalistic spiritualistic version, and he tried to show that Spinoza's materialistic formulation ran into all sorts of special problems.<sup>34</sup> But "the great difficulty of Spinoza, and the Cabbalists before him, is that nothing can come from nothing. If that is so, God has produced nothing outside of himself. Then all parts of the universe must necessarily be parts of the One only substance."<sup>35</sup> Basnage insisted that this was implausible. Far more plausible is the belief that God made the material world by His infinite power, even if we do not know how this could be done. The refutation of particulars in Spinoza's theory Basnage left to his friend, Pierre Bayle.<sup>36</sup>

In the next chapter Basnage went on to deal with other Jewish theories of creation.<sup>37</sup> Here he plunged into the Kabbalistic writings in the *Kabbala Denudata*, Luria's work, More's response, and Abraham Cohen Herrera's work.<sup>38</sup> Strikingly, Basnage disavowed the claim of various Christian Kabbalists who found Jesus, the second person of the Trinity, in the Kabbalistic explanation of how the world was generated from God.<sup>39</sup> Exposing the mistake of the Christian Kabbalists, who find what they want in the obscure expressions of the

Jewish exegetes, Basnage said: "Cohen Irara, a Portuguese Cabbalist who wrote at the end of the last century, has shown us how to understand the thought of the Cabbalists."<sup>40</sup> He then outlined Herrera's emanation theory.

Basnage gave no source for his reading of Spinoza as a Kabbalist or for taking Abraham Cohen Herrera's text as the clearest statement of the Kabbalistic emanation theory. He made no mention of Wachter's book. But Basnage read a vast amount of Jewish literature for his *Histoire des Juifs*, mostly in Latin or modern language editions (although he cited some texts in Hebrew). He did not have access to the manuscripts of the Jewish anti-Christian polemics written in Holland until some were sold in the auction of his son-in-law's library in 1715.<sup>41</sup> This would indicate that he did not have deep connections in the Dutch Jewish world. He did not even have access to the sort of Kabbalistic manuscripts that Knorr von Rosenroth edited. But he knew a lot of gossip and rumor about the Jews of his day, some of which looks as if it came from Jewish informants rather than books.<sup>42</sup> He did not name people he might have talked to. He went to Holland himself after Spinoza was dead. He knew of Orobio de Castro; but, unlike Locke or Philip van Limborch, he does not seem to have known him personally.<sup>43</sup>

Johann Georg Wachter, on the other hand, knew at least one Amsterdam rabbi, namely Moses Germanus. He had known him first as Johann Peter Speeth (or Spaeth), a disciple of Jacob Spener, and collaborator of Knorr von Rosenroth in the *Kabbala Denudata*. Speeth went through a series of spiritual gyrations in the 1680s and 1690s, going back to Catholicism, then becoming involved with Quakers, Mennonites and Socinians, studying Hebrew and Kabbalah, and finally in 1697 becoming a Jew in Amsterdam and a rabbi of the Portuguese Synagogue, with the name Moses Germanus. Wachter came to visit him and derived his ideas about Spinozism and Kabbalism through this personal contact and through letters from Moses Germanus.<sup>44</sup>

A, or *the*, central issue in relating Spinoza to the Kabbalah for Wachter was the centrality in Spinoza, Moses Germanus, and Abraham Cohen Herrera of the principle, *ex nihilo nihil fit*—the problem of articulating a satisfactory emanation theory. It seems too great a coincidence that both Basnage and Wachter saw this as a central issue in Spinoza, unless the two had a common source.

Wachter spoke of the issue as to whether Spinozism was a Kabbalist theory or came from Kabbalism as the latest controversy going on in Holland.<sup>45</sup> Like Basnage, he related the thesis of Moses Germanus and of "Judaism" that "dass alles Wesen Gott sey," with the "rabbinical" and Kabbalistic principle, *ex nihilo nihil fit*<sup>46</sup> and contended that these two theses lie at the heart of Spinoza's view. In this form there is a similarity between Spinoza's, Herrera's and Moses Germanus' formulations, especially if one leaves out the dimension Basnage made all-important, the material aspect of Spinoza's God—and if one ignores the differing conceptions of Divine Causality.

I should like to consider three questions about these early readings of Spinoza: (a) could Spinoza have drawn his views from Kabbalistic sources? (b) is the similarity stressed by Basnage, Wachter and Moses Germanus significant? and (c) do the differences between Spinoza's views and those of the Kabbalah make the similarities of little importance?

Given Spinoza's statement in the *Tractatus Theologico-Politicus* that he read and knew "Kabbalistic triflers," "whose insanity provokes my unceasing astonishment," it remains to be asked whether Spinoza adopted any of the Kabbalistic outlook. Wachter and Moses Germanus were struck by Spinoza's remark in one of the last letters to Henry Oldenburg, at the end of 1675, where Spinoza said, "For I hold that God is of all things the cause immanent, as the phrase is, not transient. I say all things are in God and move in God, thus agreeing with Paul, and perhaps with all the ancient philosophers, though the phraseology may be different: I will even venture to affirm that I agree with all the ancient Hebrews, in so far as one may judge from their traditions, though some are in many ways corrupted."<sup>47</sup> Wachter and Moses Germanus took this as a confession by Spinoza to his close friend, Oldenburg, that his views preserved the tradition of the Jewish Kabbalah in a kind of Jewish Neoplatonism.<sup>48</sup>

Spinoza could have learned something about the Kabbalah while a student at the Synagogue. He was a student of Aboab while the latter was translating Herrera's work. He could have read the published Hebrew version. After the excommunication, Spinoza was close to many Christian mystics among the Quakers, Collegiants and Mennonites. People whom Spinoza knew—like Adam Boreel, the

leader of the Collegiants, who took in Spinoza in 1656—knew Van Helmont, the close associate of Knorr von Rosenroth. Van Helmont was *au courant* in Kabbalistic studies, and his work on the Hebrew language was itself a major Kabbalistic work.<sup>49</sup> So Spinoza's known circle of mystical non-denominational Christians overlapped with the Van Helmont-Knorr von Rosenroth one; Spinoza could have known their views, and they his. Knorr von Rosenroth studied Hebrew and Kabbalah with rabbis in Amsterdam for several years. He was there while Spinoza was alive. He was editing the *Kabbala Denudata* by 1670 and published the first volume in the year of Spinoza's death. A manuscript at the Herzog August Bibliothek in Wolfenbüttel tells of a trip Knorr von Rosenroth took to Amsterdam in the 1660s. He did not name many of the people he saw there, but he met many scientifically inclined intellectuals and religious figures.<sup>50</sup> In the preface to the *Kabbala Denudata*, he states that he got the impressive collection of manuscript material he used from an unnamed rabbi who was then denounced by the Jewish community. All sorts of troubles descended on the rabbi and his family, he reports, for giving him the material, and on Knorr and his family for receiving it and making it available.<sup>51</sup>

Boreel too, who edited the Hebrew text of the *Mishnah* with the aid of rabbis Judah Leon Templo (who lived and ate in Boreel's house), Menasseh ben Israel, and Isaac and Jacob Abendana, complained about how secretive the Jews were about their religious documents.<sup>52</sup> Yet Boreel and Menasseh apparently agreed to take part in a College of Jewish Studies to be established in London to publish the texts of the Jewish mysteries in Hebrew and in translation.<sup>53</sup> The English Deists found it impossible to obtain the Jewish anti-Christian documents by leaders like Ḥaḥam Saul Levi Morteira, Orobio de Castro and others, until they suddenly turned up in the sale of Basnage's son-in-law's library in 1715.<sup>54</sup> Previously the only indication that these works circulated outside the Jewish community is a note by Orobio on one of his manuscripts, saying he did not publish it for fear of causing scandal, but he showed it to the Jesuits in Brussels, who liked it.<sup>55</sup>

Presumably the Jewish community would be even more guarded about Kabbalistic documents by Luria, Hayyim Vital, Israel Sarug and others, many of which were not published in Hebrew until the late nineteenth or early twentieth centuries. The fact that a renegade

rabbi gave this material to Knorr von Rosenroth is quite interesting. I do not know who the rabbi was—maybe Moshe Idel or Yosef Kaplan can shed light on the question. Perhaps the unknown rabbi was disillusioned by the debacle of the Sabbatian movement, which was so strong in Amsterdam, tossed away his mystical manuscripts, and left for a new life in America.

At any rate, the Kabbalistic material passed into Christian hands in Amsterdam in the 1660s or early 1670s. Knorr von Rosenroth obviously showed it to Van Helmont, and it probably became known amongst the philosemitic mystical Christians like Boreel, Serrarius, Furlly, Dury (who was Oldenburg's father-in-law), and others, many of whom regularly attended Synagogue services and interacted with the Jewish community.<sup>56</sup> Peter Serrarius, Spinoza's patron, was the leader of the Christian followers of Shabtai Zvi and did some Kabbalistic studies with Amsterdam rabbis on the matter.<sup>57</sup> Spinoza could easily have come to know of the materials available to these Christians.

Contrary to the accepted story, Spinoza knew some Jews in the twenty-one years after his excommunication. He knew the son-in-law of Rabbi Benjamin Musafia of Copenhagen, and he was a close friend of the Egyptian Jew Henriquez Morales (Henri Morelli), the physician of the libertine poet Charles St. Evremond.<sup>58</sup> He may have known others, especially if they were not members of the Amsterdam synagogue. From the Jews he knew he may have learned some things about the Jewish intellectual interests of the time. Oldenburg asked him what he knew about the appearance of the King of the Jews (Shabtai Zvi) and what the Jews of Amsterdam thought about this.<sup>59</sup> Regrettably, the answer (if there was one) is missing, but we have Serrarius' answer. And Serrarius was the point of contact between Spinoza in Holland and Oldenburg and Robert Boyle in England, receiving and transmitting their mail. He was clearly involved with the Amsterdam Jewish Sabbatians and sent copies of Shabtai Zvi's letter to the Amsterdam Jews to John Dury in Switzerland. Thus *he* had access to such a document!<sup>60</sup>

Spinoza, then, had Christian and Jewish contacts who could have given him access to the Kabbalistic ideas and materials being studied in the Jewish community. Further exploration of Spinoza's Christian Millenarian contacts and his Jewish ones may reveal more about Spinoza's knowledge of what was going on in the Jewish world, and

about knowledge among Jews of Spinoza's activities. But even what we know now shows us that Spinoza could have used Kabbalistic sources or ideas. The view stated by Basnage is not preposterous; it is even genuinely possible. Spinoza could have been a secret Kabbalist trying to assert his own originality.

Whether or not Spinoza drew from Kabbalistic sources and ideas, is there enough similarity between his views and Kabbalistic ones to be of any importance? Here I think one has to distinguish between the detailed Kabbalistic system, with the *'Eyn Sof*, the Adam Kadmon, and other elements unmentioned by Spinoza, and a metaphysical system such as that presented by Abraham Cohen Herrera as a basis for, or prelude to, Kabbalism. There are some striking similarities between Part I of the *Ethics* and the first five chapters of Herrera's *Porta Coelorum*. A detailed study would, I think, show that Spinoza and Herrera held to similar views about the status and nature of being or substance and its relation to supposedly created objects. They both had, for want of a better term, a Neoplatonic conception of the One, or Substance. Herrera probably came by his views from the Florentine Platonists. Both men had to hold some kind of emanation theory to account for other existences without allowing for independently caused or produced entities. Both have the basic problem of explaining how and why there is something other than just Being as such. If these features are taken as central, then Spinoza and Herrera have similar metaphysical commitments, which can be described as Basnage, Moses Germanus and Wachter did, as exhibiting the consequences, in a Neoplatonic metaphysics, of accepting either Spinoza's theory of causality, or Herrera's theory of necessary existence, or *ex nihilo nihil fit*.<sup>61</sup>

Interesting as this may be for the ontology of Part I of the *Ethics*, it does not come to grips with either Spinoza's theory or Herrera's of what the world is like and how it operates. The Kabbalistic orientation may have helped fix Spinoza's and Herrera's starting place, but it does not reveal where their respective theories led. Given the purposes of the early interpreters, Basnage, Moses Germanus and Wachter, however, the characterization of the initial orientation may have been enough.

If Moses Germanus originated the interpretation of Spinoza as a secret Kabbalist, as Leibniz claims in the *Theodicy*,<sup>62</sup> we have reason to believe, from a letter of Moses Germanus to Van Helmont

in 1696, that Moses was opposing both Spinoza and Kabbalism in order to advance his own idiosyncratic version of Judaism.<sup>63</sup> Having gone through so many religious and theological turnings, from Catholicism to mystical pietistic Protestantism, back to Catholicism, to the radical Protestantism of the Quakers, Mennonites and Socinians, Moses Germanus became a Jew. As he explains, he became convinced that the Jewish people were the suffering servant of *Isaiah 53*, and Van Helmont urged him to convert to Judaism and move to Amsterdam.<sup>64</sup> What appears in his Amsterdam years indicates that he had developed an extremely Jewish version of Christianity and saw the presence of the actual Jewish Messiah as a historical reality of his time. He claimed to oppose Spinoza's ahistorical and irreligious views and the Kabbalah's obfuscations. What the Jewish people really yearned for, he insisted, was the Messianic Redeemer. Jesus, ■ rabbi of Roman times with fine moral teachings, was, like other Jews, hoping for and expecting this Redeemer. Around 200 of the Common Era, he was grossly and deliberately misinterpreted as presenting himself as the redemptive Messiah. A conspiracy of sinister forces established Christianity and maintained it up to the Reformation. Then one could again see the New Testament for what it was, the life of a pious rabbi conjoined with some inspirational literature, and some dastardly addenda that created a pseudo-Messianic movement around Jesus of Nazareth after his death.<sup>65</sup> This Judaizing version of Christianity (later adopted by some German Bible critics) was coupled with a Messianic Judaism centered on the person of Oliger Pauli, a Dane who had a Jewish grandfather. Moses Germanus and Pauli caused a great deal of stir and agitated the rulers of Europe to join them in liberating Palestine, reestablishing the Jewish people there, and rebuilding the Temple.<sup>66</sup>

It appears that Moses Germanus rejected Spinoza's irreligion along with the Christian reading of the Kabbalah, which he had known first hand as a worker with Knorr von Rosenroth on the *Kabbala Denudata*, in order to advocate his own brand of Messianism. His ground for rejecting both would be the same: their common metaphysical assumptions as reflected in their handling of the problem of emanation. Evidently, for him, this single common theme provided sufficient grounds for rejecting the two systems, as well as for linking them, regardless of what other views Spinoza, or Herrera, or other Kabbalists might hold.

Wachter visited Moses Germanus in Amsterdam shortly after he settled there. As a result of conversations and letters he received, Wachter grew deeply disturbed by Moses Germanus's anti-Christianity. He saw Amsterdam Judaism as being in ferment because of Spinozism and because of Moses Germanus' views. Wachter published his exchange with Moses Germanus, in which the latter attacked Christianity as modern paganism.<sup>67</sup> One aspect of Wachter's counterattack was to contend that Moses Germanus' theory was, all protestations notwithstanding, just Spinozism and Kabbalism. Much of the evidence he offered was to show that Moses Germanus and Spinoza held the same views as Herrera, especially regarding Being, *ex nihilo nihil fit*, and emanation.<sup>68</sup> A substantial part of Wachter's response is an analysis of Herrera's text in the *Kabbala Denudata*.<sup>69</sup> Wachter hoped to undermine Judaism, whether in the form it took in Moses Germanus or as represented in Herrera. Part of his tactics was to lump these thinkers together with the notorious heretic Spinoza.

Basnage offers a more interesting interpretation than Moses Germanus' of Spinoza as a Kabbalist, first because he deals more directly with Spinoza, and secondly because Basnage saw that Spinoza's emanation theory was a materialistic rendition of Cartesianism, a modern scientific account of the world. Basnage himself was involved with a kind of Calvinist Cartesianism, and so could see Spinoza in both the Cartesian and Kabbalistic traditions.<sup>70</sup>

Basnage undertook his massive *Histoire des Juifs* from Roman times to the present, not just out of curiosity. He knew that Menasseh ben Israel had planned such a work, a continuation of Josephus, as evidence that Jewish history is Providential History.<sup>71</sup> Basnage was a Millenarian, concerned to show, through Jewish history, that God is active in history, and in His Actions towards the Jews is bringing about the climax of human history, the Thousand Year Reign of Christ, which Basnage foresaw as starting in the early eighteenth century. Jewish history illustrates God's power, God's concern, God's wrath, and God's redemptive action. In studying Jewish history, the true and believing Christian will have his faith reinforced, and the Jew may be enlightened to see that he has to overcome Jewish myopia and recognize the fulfillment of Judaism in Christianity.<sup>72</sup>

Basnage's work is quite tolerant, especially when compared with what German experts on Judaism, like Wagenseil, Spitzel and others, were turning out.<sup>73</sup> Basnage tried to be objective and to get the facts from reliable sources. He studied Jewish texts and apparently collected a lot of oral history from people in the Netherlands. He often defended the Jews from false anti-semitic accusations. And he was unimpressed with the efforts of those who tried to convert the Jews through force or arguments. Force had backfired in Spain and Portugal, creating the Marrano situation; and Jews usually won the arguments.<sup>74</sup> So, Basnage advised letting God do the actual converting.<sup>75</sup> But a learned, well-intentioned Christian could see that what kept intelligent Jews in their blindness was their philosophy—Kabbalism. Basnage had read the *Kabbala Denudata* and other sources and saw the Kabbalah as the central ideology of Judaism. He devoted a large section of his study to the history of the Kabbalah and explanation of its doctrines.<sup>76</sup> For he was convinced that once the Jews saw the faults and flaws of their Kabbalistic theosophy, they would be prepared for conversion.

Bringing Spinoza into the discussion of Kabbalism was a way of indicating what was wrong with Spinoza and of showing that the roots of Spinoza's atheism lie in Kabbalism. If one could show (a) that Spinoza was a Kabbalist in metaphysics, and (b) that he was an atheist, then his Kabbalism would seem to imply his atheism. Revealing Spinoza's hidden sources in the Kabbalah would destroy his claim to originality. At the same time, Spinoza's sacrilegious results would explain why the Kabbalists were not anxious to claim him as their heir.<sup>77</sup>

All this I presume Basnage got first, second, or third hand from Moses Germanus. But Basnage did see and emphasize the critical difference between Spinoza's emanation theory and the Kabbalistic one, that for the Kabbalists all derivative being is spiritual. For Spinoza, Basnage contended, all derivative being is material. "The Kabbalists agree further with Spinoza in recognizing only one unique Substance, but this impious one makes this substance material, in order to make God corporeal and to annihilate the spirituality of this being."<sup>78</sup> Basnage saw Spinoza's materialism as allowing him to take over Cartesian science but leaving a host of problems, such as how to explain mental or spiritual events and how to explain contrary or conflicting modifications of the one substance. Basnage contended

that the only novelty in Spinoza's theory was in his use of the term "modification."<sup>79</sup> But having done this, he argued, Spinoza had left himself open to the problems that fill dozens of pages in Pierre Bayle's rather amazing article on Spinoza. Basnage was a close friend of Bayle's and cited the text in which Bayle tried to make hash out of Spinoza's views by identifying modifications with substance and arguing that for Spinoza "God is hot" and "God is cold" simultaneously.<sup>80</sup> In short, Basnage sought to push Spinoza back to a Jewish Kabbalistic world and to make his theory a mass of contradictions, discrediting both Spinoza and his Kabbalistic roots. Elsewhere Basnage sought to show that Spinoza's Bible criticism and its impious conclusions came from Jewish sources.<sup>81</sup>

To picture Spinoza as a Kabbalist taking over Jewish views then appearing in the *Kabbala Denudata* was natural for Moses Germanus, Wachter and Basnage. In terms of the interest each had in Judaism, such an interpretation was not far-fetched. From their perspective, Spinoza's metaphysics at its core looked the same as Herrera's. It was certainly possible that Spinoza had known of Herrera's views and used them. Anyone who bought the *Kabbala Denudata* and Spinoza's *Opera Posthuma* in 1677 might have thought them related works, at least until reaching the exposition of Spinoza's Cartesianism or discovering the details of real Jewish Kabbalism.

Seeing how Spinoza's contemporaries could read him as a Kabbalist helps us understand, I think, the milieu in which his ideas appeared. He was connected with many mystical non-denominational Christians, followers of the pantheism of Jacob Boehme. He was also involved with freethinkers. But there is little in his correspondence or writings that shows he was involved with Cartesians, that is, living followers of Descartes. He was interpreted by some as a Kabbalist, and his metaphysics may reflect a synthesis of Cartesianism and Kabbalism. Our received view of Spinoza's thought as growing out of the Cartesian ferment has dulled us to the much richer, more exciting intellectual world in which he flourished. If we can see him as some of his contemporaries did, we may discover that in spite of all the difficulties that dogged his intellectual career, and in spite of his ongoing polemical attacks on Judaism and the Jewish community in which he was reared, Spinoza may have still derived a central part of his philosophy from a vital part of his heritage—the Kabbalism then being studied in Holland. Perhaps he

was trying to utilize the Neoplatonized Kabbalism of Herrera as a way of integrating the new science and the rational/spiritual mysticism of his time. If we can suspend disbelief in Spinoza as a Kabbalist, we may find him a much more exciting and excited thinker.

### Notes

1. The possibility that Spinoza drew his philosophical theory from Chinese thought was raised in the article "Spinoza," Rem. B, in Pierre Bayle's *Dictionnaire historique et critique*.
2. Jacques Basnage, *The History of the Jews from Jesus Christ to the Present Time: Containing their Antiquities, their Religion, their Rites, the Dispersion of the Ten Tribes in the East, and the Persecutions this Nation has suffer'd in the West. Being a Supplement and Continuation of the History of Josephus* (London, 1708) Book IV, ch. vii, 294. The work originally appeared in French in 1707, with the second, greatly enlarged edition in 1716.
3. Loc. cit. Pierre Bayle was among those accused of not understanding Spinoza when he criticized his philosophy. See Remark DD of Bayle's article "Spinoza."
4. Johann Georg Wachter, *Den Spinozismus im Judenthums, oder, die von dem heutigen Judenthumb und dessen Geheimen Kabbala, vergottete Welt, an Mose Germano sonsten Johann Peter Spaeth von Augsburg geburtig befunden under widerleget* (Amsterdam, 1699).
5. Benedictus de Spinoza, *Theological Political Tractatus*, chap IX, ed., R. H. M. Elwes (London, 1883; repr. New York: Dover, 1951), 140.

47. Letter to Oldenburg, Epistola LXXIII.
48. Wachter, 34.
49. Francis Van Helmont's *Kurtzer Entwurff des eigenthielen Natur-Alphabets der Heiligen Sprache* (Sulzbach, 1667). Allison Coudert is preparing an edition of this work.
50. The Herzog August Bibliothek at Wolfenbüttel has a great many of Knorr von Rosenroth's papers including correspondence and materials used in the *Kabbala Denudata*. The account of his trip is MS. Extrav. 253.1.
51. See Knorr von Rosenroth, "Lectori Philebraco Salutem," *Kabbala Denudata*, 1.18-19. The passage is translated in Allison Coudert, "A Cambridge Platonist's Kabbalist Nightmare," 695.
52. John Dury reported that Boreel was having difficulties with the rabbis about the Spanish translation of the *Mishnah* "by reason of the icalousie & envious spirit wch in yt Nation to hinder all strangers from the knowledge of their law and way." Letter of John Dury to Samuel Hartlib, Amsterdam 5/15 July 1661, Hartlib Papers, Sheffield University MS. 4/4/26. On the Jewish-Christian project to edit the *Mishnah*, see R. H. Popkin, "Some Aspects of Jewish-Christian Theological Interchanges in Holland and England, 1640-1700," in J. van den Berg and E. G. E. van der Wall, eds., *Jewish-Christian Relations* (Dordrecht: Kluwer, 1988), 3-32.
53. See R. H. Popkin, "The First College of Jewish Studies," *REJ* 143 (1984): 351-64.
54. See Popkin, "Jacques Basnage's *Histoire des Juifs* and the Biblioteca Sarraziana," 156. Anthony Collins complained that Jews "are forbid, under pain of excommunication" to lend these documents to Christians, *A Discourse of the Grounds and Reasons of the Christian Religion*, (London 1724), 82n-83n.

55. This note appears on the flyleaf Hs. 48 E 42 of the Ets Haim, Amsterdam collection, presently at the National Library of Israel. The Portuguese text is reproduced in L. Fuks and R. G. Fuks-Mansfeld, *Hebrew and Judaica Manuscripts in Amsterdam Public Collections*, 2 (Leiden: Brill, 1975).
56. See Popkin, "Some Aspects of Jewish-Christian Theological Interchanges."
57. Serrarius described a Kabbalistic discussion with "quelque Juif" in 1664 in a letter to Dury, Zurich Staatsarchiv Ms. E. II. 457d, fol. 421(659). On Serrarius see E. G. E. van der Wall, *De Mystieke Chiliast, Petrus Serrarius (1600-1669) en zijn Wereld*, (Dordrecht: ICG, 1987); and R. H. Popkin, "A Note on Serrarius," in K. O. Meinsma, *Spinoza et son cercle* (Paris, 1983), 277-79, n. 62.
58. Cf. Michael Petry and Guido van Suchtelen, "Spinoza and the Military: A Newly Discovered Document," *Studia Spinoziana* 1 (1985): 361-69; and R. H. Popkin, "Serendipity at the Clark: Spinoza and the Prince of Condé," *The Clark Newsletter* 10 (1986): 4-7.
59. Letter of Oldenburg to Spinoza, London, 8 December, 1665, in Marie Boas Hall and A. Rupert Hall, eds., *The Correspondence of Henry Oldenburg*, letter 467 (Madison: University of Wisconsin Press, 1965) 1.633-37.
60. Serrarius to Oldenburg, 5 July 1667, in Oldenburg Correspondence, letter 652, 2.446-47. Letter 493, 2.48-51, a report from Oldenburg to Robert Boyle about what was happening in Shabtai Zvi's affairs, is probably based on information from Serrarius. Dury's letter to Ulrich, January 25, 1666, Zurich Staatsarchiv MS. E. II. 457e, fol. 747; and van der Wall, *Mystieke Chiliast, Petrus Serrarius*, esp. Hoofdstuck X.
61. Neither Spinoza nor Herrera used the formula *ex nihilo nihil fit*, but it is equivalent to Spinoza's axioms 1, 2, 3 and 7, and to Herrera's, "Quod entia vel omnia sint necessaria, vel omnia contingentia." cap. I.
62. Leibniz was taken in the eighteenth century as the authority on this. He said, in the *Théodicée*, sec. 9, "Un certain Allemand natif de la Suabe, devenu Juif il y a quelques années et dogmatisent sous le nom de Moses Germanus, s'étoit attache au dogmes de Spinoza, a cru que Spinoza renouvelle l'ancienne Cabale des Hebreux; et un savant homme [Wachter] qui a refute ce proselyte Juif, paroît etre de meme sentiment." Leibniz knew both Wachter and Van Helmont personally.
63. See Wachter, end of "Vorrede"; and H. J. Schoeps, *Philosemitismus im Barok*, 67-81.
64. See "Spaeth," *Jewish Encyclopedia* 11.484; and Johann Jacob Schudt, *Judische Merckwürdigkeiten* 1.273, 4.194.

65. "Spaeth," *Encyclopedia Judaica* 15.219-20; Schoeps, 67-80, and Schoeps, *Juden, Christen und Judenchristen* (Bern: Francke, 1965), 83-91.
66. See Schoeps, *Philosemitismus im Barok*, chapters on Pauli and Moses Germanus, 51-81, and articles "Spaeth" and "Pauli, Holger (Oligier)," *Jewish Encyclopedia*, 11.483-84 and 9.563.
67. Wachter published Moses Germanus' "Gegensatz der Jüdisch und Heydischen Religion" in German and Latin at the beginning of his book, along with his own answer to it.
68. Wachter, *passim*.
69. Wachter, 81-101. The third part of Wachter's work is directed against Spinoza.
70. On Basnage's career and interests, see Gerald Cerny, *Theology, Politics and Letters at the Crossroads of European Civilization: Jacques Basnage and the Baylean Huguenot Refugees in the Dutch Republic* (Dordrecht: Kluwer, 1987). On Calvinist Cartesianism, see Michael Heyd, *Between Orthodoxy and Enlightenment, Jean-Robert Chouet and the Introduction of Cartesian Science in the Academy of Geneva* (The Hague: Nijhoff, 1982).
71. Basnage referred to Menasseh's project several times. In his discussion of Menasseh, he gave the intended title as *Historia y Continuacion de Flavio Josepho hasta nuestros Tiempos, Histoire des Juifs*, Livre IX, chap. xxxvi, Tome XV, 1001.
72. Basnage, *Histoire des Juifs*, Livre I, ch. 11; and Cerny, ch. 5.
73. As Cerny points out, "The Huguenot historian was profoundly repelled by Christian persecution of the Jews," and he admired the Dutch toleration of the Jews; 198-99. He did not support any of the blood libels that appear in the writings of Wagenseil and others.
74. See Cerny, 182-200, for Basnage's objectivity. In the last chapter, Livre IX, chap. xxxix, Basnage evaluated the attempts to convert the Jews.
75. Basnage, *Histoire des Juifs*, Livre IX, chap. xxxix, 1140: "Dieu seul connoît le tems auquel il rappellera cette Nation elue. Cette Réflexion engage les Chrétiens à prier Dieu pour eux, au lieu d'employer les Moïens violens qui les oppriment, & ne les convertissent pas."
76. The Kabbalah is discussed throughout the work. Livres III and IV offer a very detailed discussion of Kabbalistic doctrines. All sorts of Jewish and Christian sources were used.
77. This seems to be the point of Livre IV, ch. vii, where Spinoza is treated as a secret Kabbalist.

78. Basnage, *Histoire des Juifs*, Livre IV, ch. vii, sec. 5, 136 in the French edition. The English edition, 295, reads "that Wretch" for "impious one."
79. Basnage, 137-38.
80. Bayle, "Spinoza," Remarks N and DD.
81. Basnage, *Histoire des Juifs*, Livre V, ch. i, sec. ix. He also includes a biography of Spinoza in the section on Jews in Holland, Livre IX, ch. xxxvii, sec. vii-xii, which is quite critical.

## The Psychodynamics of Neoplatonic Ontology

Robert B. McLaren

It is a commonplace that analytical psychology is concerned with dynamic "integrative principles" that preserve the self intact.<sup>1</sup> These principles include orientation toward need-satisfying goals.<sup>2</sup> Among the followers of Freud it has been a basic tenet that the striving to achieve these goals is psychosexual in nature. Religion, as one integrative strategy, is not less psychosexual than the rest and arises from the effort to identify with a projection of one's earthly father after discovery of his limitations.<sup>3</sup>

It may be argued that the psychodynamic approach is inadequate for, if not irrelevant to, the study of Neoplatonic ontology. Freud addressed himself primarily to the monotheism of Judaism and Christianity, while Neoplatonism proposes not a paternal deity but an Ultimate Reality, *ontos on*, the ineffable One, who transcends being, and is clearly unrelated to anything so crude as a Father-figure-in-the-sky.

Three responses may be proffered before entering on our main line of argument. First, the Freudian interpretation of the father-projection has not met with universal acceptance even among analysts. It is certainly foreign to the religious experience of many who have sought understanding, from the Hebrew prophets to Maimonides, to Maslow and Einstein. Indeed the earliest conception

of YHWH was that of One who is Ultimate Being, yet no mere being: *ehyeh asher ehyeh*—I AM THAT I AM (Exodus 3:14), whose very name was not to be pronounced lest it suggest finitude. Lenn Goodman points out that "Maimonides advised parents from the earliest age (in marked contrast to Plato) to inform their children that God is not ■ person or a thing."<sup>4</sup> Einstein echoed this idea, placing blame for present-day conflicts between science and religion on the concept of a personal God, "which we must have the stature to give up."<sup>5</sup> Yet both Maimonides and Einstein, like others who rejected personifications of the deity, believed YHWH to be personal in essence—approachable and responsive.<sup>6</sup>

Second, the eagerness with which the Neoplatonic concept of the *ontos on* has been embraced by thinkers outside the Neoplatonist tradition, when traditional religious notions have been found wanting, is most appropriate and interesting for psychological study.

Third, while the psychosexual element of religious experience seems (at least on the surface) wholly lacking in Plotinus' discussion of the One, the Neoplatonist trend in later mysticism produced remarkably vivid sexual content, which has not escaped the notice of even those furthest removed from Freudian interpretation. Perle Epstein notes: "A favorite theme for meditation among Spanish Kabbalists is the *Matrone*, or female aspect of God's face. In Kabbalah the very presence of the living God in the world is female. Rabbi Joseph, a thirteenth century mystic, writes in his *Sefer Tashak*: 'She so pervades the lower world that if you search in deed, speech, thought and speculation, you will find *Shekhinah*, for there is not beginning nor end to her. . . . Her hair, like the Father's beard, is black and curly.' The thirteenth century Castilian Kabbalist Rabbi Joseph's erotic motif presents the cosmos in the form of a grand sexual embrace."<sup>7</sup> Alexandre Safran, commenting on the Kabbalah, notes that Israel is herself "female," and that every Israelite shares in a mystical, communal soul which is at one with God.<sup>8</sup>

In a world where betrayed trusts, estrangements, warfare and death have so often overwhelmed persons and whole communities, and the comforts of traditional faiths have seemed illusory, the desperate need for spiritual security has driven many to seek alternatives. The search has sometimes led to a First Hypostasis, an Allsoul or Oversoul, the One, or to a rejection of any "ground of

being" at all. Whether, as R. M. Martin has suggested, the logic of Neoplatonism leads to "a kind of Principle of Pan-psychism" or to sheer atheism,<sup>9</sup> the gauntlet to investigate is down.

# I

A falling away from the faith of the forefathers in times of disaster, when the gods or Providence seem impotent or absent is not new to human history. Thus the taunt of Elijah to the dismayed worshippers of Baal: "Cry aloud, for he is a god; perhaps he is asleep and must be awakened" (1 Kings 16:27). The Hebrew people themselves were often so disheartened by circumstances as to neglect the faith, while indulging themselves (Haggai 1:4-7) or redoubling their efforts to placate the Deity they thought had forsaken them by multiplying their ceremonies—to the neglect of justice and acts of charity, as their prophets charged (Isaiah 1:11-17; Amos 5:21-24). Sometimes they squabbled over whose worship was most acceptable to the Lord (Ezra 4:1-3) or abandoned YHWH in favor of other deities: "Whoring after other gods" (Deuteronomy 31:16; Ezekiel 23:30). Indeed many of the nineteen major and minor prophets of Scripture excoriated their fellow Jews for apostasy in terms so blistering as to be exiled or martyred.

After the tragic years of the Temple's destruction, the generation of Babylonian captivity, occupation by the Greeks and brutalization by the Romans, many of the more sophisticated Jewish scholars, particularly in Alexandria, were attracted to the mystical aspects of Platonic and Pythagorean thought. In the region of Jerusalem, Hellenization was extensive. "Palestinian Judaism," Jacob Neusner points out, "and the Pharisaic sect in particular, are to be seen as Jewish modes of a common international cultural style known as Hellenism. Some of the most important terms of Rabbinic Biblical exegesis have been borrowed from the Greek. This is basic; the existence of such borrowing can be explained only by a period of profound Hellenization."<sup>10</sup> It was a characteristically Hellenistic trait to demand precise readings and interpretations of texts (a tendency that persists today among Fundamentalist Christians) and to insist that every word of Scripture be literally applied. Some scholars

argue that it was Jesus' comparative liberalism that sparked the conflict between himself and the Pharisees, rather than opposition to Phariseeism *per se*.<sup>11</sup>

Amid the political, social and cultural decay of the Roman empire, there was a readiness, especially among intellectuals, to accept the exile and seek comfort in Neoplatonism. It replaced the rigors of the old Phariseeism and the pessimism of the Sadducees with mystical elements, theurgics, and a soteriology of ultimate union with the *en kai pan*. Psychologically, the appeal appears to have been to turn away from the "almighty" god who had commanded obedience to a host of laws and regulations, but who failed to defend them as he had promised, and to embrace a concept of a transcendent, holy, yet impersonal, One.<sup>12</sup> It was both intellectually and emotionally satisfying to contemplate the utter transcendence of the One and to ponder how from this apparent non-Being, goodness and perfection may emanate—for goodness and perfection themselves were to be expected only beyond the phenomenal world.<sup>13</sup>

Next to our hunger for spiritual security in ■ providential God, perhaps our most primitive spiritual impulse, a root both of religion and philosophy,<sup>14</sup> has been the human eagerness to identify with an earthly monarch who could embody the Logos, the spirit and wisdom of Deity. Thus Stobaeus wrote: "To look at the king should put one in order like the music of a flute."<sup>15</sup> In Jewish experience kings rarely justified such ■ description. Yet the dream persisted and can be found even in Philo,<sup>16</sup> and in the pagan Neoplatonist Proclus, whose antipathy to Christianity arose at least in part from Christians' refusal to bend the knee to earthly powers. Yet many Jews had had enough of kings and high priests. Those who could embrace the One, in preference to the God of their fathers, could find in Neoplatonism freedom from dependence on impermanent thrones as well as on traditional faiths.

This is not at all to suggest that these Neoplatonists had become impious or had rejected all loyalty to civil society. Indeed their piety was enhanced by the conception that all persons, objects and virtues are emanations from the One, and that in what Plotinus calls *epistrophe* all things yearn to return to the Source. The longing to recover oneness with the One is the highest expression of religious faith. And because Neoplatonists believed all souls are ultimately one, having originated in the One, they could see human society as

comprised of a brotherhood of persons who must share concern for one another's well being.<sup>17</sup> Although "the Soul is evil by being infused with the body,"<sup>18</sup> and all mortals share in the debility of sin,<sup>19</sup> we still have freedom to act, to improve by keeping our eyes on the perfection of the One. This focus on the Ideal, the *Intellectual Principle*, is seen on three orders: the merely material ("those who adopt this as their philosophy are like birds who are so weighted down they cannot fly"); the moderately transcendent; and "the third order—those godlike men who, in their mighty power, in the keenness of their sight, have clear vision of the splendor above and rise to it from among the clouds and fog of earth and hold firmly to the other world."<sup>20</sup>

It was this third quality of life that had such appeal to the religious expatriates of both Judaism and Christianity in the early centuries of the common era. The concept of humanity united with the Ultimate Being through contemplation, provided a philosophical vantage point from which to view the storms of life with a measure of serenity. This certainly played a major role in the production of Boethius' book, *The Consolation of Philosophy*, one of the most popular writings in Western Europe soon after its appearance in 524. His experience affords an apt illustration for psychodynamic study. When still a child he lost his father, whom he worshipped; he was raised by foster parents, received a good education and achieved some social prominence, but was arrested and imprisoned on political grounds. In disgrace and awaiting execution, he reached beyond conventional religion for solace. He described the inspiration for his book: "While I silently pondered, and decided to write down my wretched complaint, there appeared standing above me a woman of majestic countenance whose flashing eyes seemed wise beyond the ordinary wisdom of men." As the scholarly prisoner dried his tear-stained face with her robe, the apparition introduced herself as Lady Philosophy.<sup>21</sup> Her rival, Lady Fortune, is presented as the personification of prosperity and adversity which so easily entraps the earthly-minded. From a psychoanalytic viewpoint, such use of female figures as both saviors and seducers (whether Lady Philosophy, the Holy Virgin, or the numerous goddesses that populate mythology), would seem to support the claims about the psychosexual nature of our commitments. Boethius' acceptance of consolation from Lady Philosophy is in terms of turning to the

unknown and unknowable God, who, he hopes can make sense of the pain of life: "O God, whoever you are who joins all things in perfect harmony, look down upon this miserable earth."<sup>22</sup> Boethius' imprisonment and the female visitors become metaphors for every mortal's struggle from bondage to freedom, from sickness to wholeness: "Happy is he who can look into the shining spring of good; happy is he who can break the heavy chains of earth."<sup>23</sup> Unity with that "shining spring of good," is the only goal worthy of striving.

Boethius adds a caveat of special interest for psychodynamic analysis. At the end of Book Three (Poem 12), in words reminiscent of the story of Lot's wife (Genesis 19:26) and of Jesus' warning against those who look back being unfit for the Kingdom (Luke 9:52), Boethius reminds us that when Orpheus sought to rescue Eurydice from hell, he was warned not to look back. His disobedience cost them both their lives, and perhaps their souls. This fable, he writes, "applies to all who seek to raise your minds to sovereign day. For whoever is conquered and turns his eyes to the pit of hell . . . loses all the excellence he has gained."

"Love is a law unto itself," Orpheus insisted, and in failing to repress the pleasure-principle of *libido*, forfeited the goal of the ego, lost the integration of the desires of the id with the demands of the superego, failed, if the symbols be resolved psychodynamically, at the synthesis of happiness with goodness. In terms of Neoplatonism, since "the Good is that on which all else depends, towards which all Existences aspire,"<sup>24</sup> the disobedience of Orpheus made impossible the achievement of that union with the Good which is the path to salvation.<sup>25</sup>

It is probable, as R. Baine Harris reminds us, that no "pure Neoplatonists" can be found after about 500 C.E., "since most of those who might be labeled as Neoplatonists have actually held Neoplatonic views in combination with other commitments."<sup>26</sup> After the collapse of Rome, amid the chaos of competing tribes and kingdoms trying to dominate Europe, popular literature continued using psychosexual metaphors and quasi-Neoplatonic elements of mysticism. Lady Nature appears in Alan of Little's *Complaint of Nature*; the female figure of Reason features in *Roman de la Rose*; the "Holy Grail" theme figures in the growing legend of King Arthur by the seventh century.<sup>27</sup> Dante will introduce both "Lady

Philosophy," and Beatrice; Holy Church and Lady Meed are both seen as feminine figures in *Piers Plowman*, and presiding over the consciousness of Christendom is Mary, "Queen of Heaven," almost the Ultimate Reality as "Mother of God."

Here indeed is grist for the Freudian mill, suggesting that the ontology of the Neoplatonists and of the mystic visionaries they inspired is a creation of the human *libido*. Contemplation of an utterly transcendent One, from which all reality emanates and to the serenity of which we all must return, would be part of what Freud called "the grand illusion." But it is well to remember the caution of one of Freud's colleagues, that "Freud's beliefs concerning religion were his own, and did not necessarily reflect the scientific findings of the process of psychoanalysis which he developed."<sup>28</sup>

Dynamic psychologists who seek the conjunction of the psychosexual with mystical elements will find little to satisfy their expectations when they examine the works of such men as the Muslims al-Kindī (ca. 801 - ca. 867) and al-Fārābī, who was called a second Aristotle (870-950); or the Christian John the Scot, called Eriugena (ca. 810-870); or the Jewish philosopher Solomon ibn Gabirol (ca. 1021-1058). Rather than the playing out of libidinal and counter-libidinal fantasies and symbolisms, a dynamic of a much more profound nature is discovered, where "deep calls unto deep," and the being of each person seeks communion with Ultimate Being.

"If you will imagine the structure of the whole," writes Solomon ibn Gabirol, "that is, the universal body and the spiritual substances that contain it, consider the formation of man and take that as an image. For the body of man corresponds to the universal body, and the spiritual substances that move it correspond to the spiritual substances that move the universal body, and among these spiritual substances the inferior substance obeys the superior and is submissive to it until the motion reaches the substance of the intelligence. You will find that the intelligence orders and dominates these substances, and you will find that all the substances that move the body of man follow the intelligence and obey it while it perceives them and judges them."<sup>29</sup> In this hierarchy of lower levels dominated and judged by the higher, Avicenna makes it clear that in wisdom, the lower will seek communion with the higher: "Know too that this is the path that leads to perfect happiness and allows us to obtain true delight, that is our end."<sup>30</sup>

It is true that a pantheistic variety of Jewish Neoplatonism evolved, and that one aspect of it led to the development of the Kabbalah. The mystical and sensual aspects of the Kabbalah cannot be denied, but the focus is on the spiritual: "Corresponding to every natural, physical function of each human organ is a spiritual function which is governed by the appropriate *Mitzvah*. Even the structure of the human soul is modeled on that of the *Torah*. Therefore the soul and body constitute a unity: Man is a unified being."<sup>31</sup> And "main-line" Judaism did not follow the most extreme doctrines and images of the Kabbalah but remained grounded in the Mosaic tradition. Maimonides recognized certain "drawbacks which the timelessness of emanation and apparent necessity of its flowing forth represented," but nevertheless found emanation "an admirable model for the relation of the divine to the world."<sup>32</sup>

Meanwhile, "mainline Christendom" was organizing into a vast power-structure, which took into itself many strains of philosophical thought. Neoplatonism, made available through the translation of a number of books by John the Scot, made its impress on numerous scholars, including Thomas Aquinas, Meister Eckhart, and Dante. Aquinas' handling of the relation of Being and the Good, and of Being and Truth, profited greatly from the Neoplatonic synthesis.<sup>33</sup>

## II

Modern Neoplatonists can probably be traced to that convulsive era of the Renaissance and Reformation when again many of the faithful found diminished confidence in established dogmas and rituals. The founders of the Florentine Academy (ca. 1462) were people of prominence in the political and religious institutions of their day. But George Gemistus Pletho and Cosimo di' Medici had already come to regard the powers of both State and Church with disdain. Preferring philosophy to theology, they found in Neoplatonism both a haven and a stimulus to creative work. In seventeenth century England the Cambridge Platonists worked to blend the new Anglican Christianity with Neoplatonic ideas. On the Continent, the legacy of Meister Eckhart (1260-1327) and Gerhard Groot (1340-1384) found a ready audience for both mystical contemplation and liberal interpretations of Scripture among the

Humanists.<sup>34</sup> Jacques LeFevre published three volumes in 1514 reflecting his position within Neoplatonism, the full importance of which was made clear in the lives of Giordano Bruno, Leibniz, and the German Idealists.

Bruno (1548-1600) makes a particularly poignant case for study, having been raised the son of an often absent father who was a professional soldier. He dabbled in magic and Greek philosophy and joined the Dominican order at seventeen. Suspected of heresy, he was nevertheless ordained a priest but soon thereafter was on trial and fled to Rome, only to be tried again and excommunicated. Sickened by the St. Bartholomew's Day Massacre of some 30,000 Protestants, he identified, in sympathy, with the Calvinists, but his unorthodox publications led to his expulsion from Geneva. At Oxford his writings and lectures took on an increasingly Neoplatonic tone: God, as the principle of unity, is known to us in the unfolding patterns of nature. Here Bruno reveals his awareness of Proclus' dictum that emanations from the One are horizontal as well as vertical. It is the evolving patterns which give the appearance of purpose, hence the notion that God is a transcendent personality. Facing death, Bruno wrote, "we may hope that our purposeful natures may be reunited with that eternal aspect of nature we call God, and of which we were originally a part."<sup>35</sup>

Like his quixotic contemporary Cervantes, Bruno was caught in the corridor between the Renaissance and the Age of Reason by Inquisitors who belonged to neither age. Unlike Cervantes, he was executed; and his death, like that of others who had challenged orthodoxy, turned many away from the familiar traditions. One may question whether the numerous failures of Christendom's primary institutions to be "Christian enough" was the major cause of the disenchantment, or whether it was a combination of the corruption of the humane ethic of the Gospels by some of its leaders and the rise of the sciences in the seventeenth and eighteenth centuries challenging the credibility of the Biblical cosmology. But it is clear that much of the "back to nature" movement which followed "the Age of Reason" and evoked a reawakened interest in Neoplatonism was the product of an emotional reaction. Lenn Goodman expressed this (though without direct reference to Neoplatonism): "The disappointment professed by fideists and agnostics . . . is expressive of the still undissolved entanglement of their thoughts in the mythic

level of religion. Hume, Bayle, Voltaire, and the numberless flotsam which drifts in the currents set up by the fall of such giants from naive faith, were convinced that the God of true religion is the God of simple faith. Failing to find that God, they believe that they (meaning religion) have failed absolutely. Their pose of melancholy loss is communicated to the Bertrand Russells and Walter Lippmanns of the twentieth century, with some loss of erudition, and stylistic verve but no loss of the essential ingredient, a true Rousseauvian introspective (if not narcissistic) angst." He adds: "These men who weep for the lost God of their childhood seem rather to be mourning childhood, which indeed they will never recapture, rather than God."<sup>36</sup>

### III

From the vantage point of dynamic psychology, these observations are highly suggestive. Certainly the loss of childhood faith, whether in one's earthly parents or in the cosmic projection of them (as Freud suspected), or in the whole matrix of family-community-religious institution-state, has often sent the despairing subject in quest of a believable substitute. But the effort to understand the Ultimately Real is not always the product of emotional distress. It is well to recall the words of Avicbron: "This is wisdom: to know the First Essence." The writer of Proverbs placed such a value on wisdom as to insist: "Wisdom is the principal thing; with all your getting, get understanding" (Proverbs 4:7). If the gaining of wisdom is the major dynamic of one's life, then comprehending the goal of such knowledge, "the First Essence" is not an exercise of neurosis but of mental health.

Historically, Neoplatonism, with its distinctive ontology, has provided an alternative to the religious traditions which seemed no longer viable to their adherents. But this fact cannot be used to infer that Neoplatonism is that and no more. Indeed its concept of the One remains as challenging today as ever, and can be found in the Pragmatic philosophies of Charles Sanders Peirce<sup>37</sup> and William James as well as in the Process philosophy of Alfred North Whitehead<sup>38</sup> and the convictions of physicists like Schrödinger<sup>39</sup> and Arthur Holly Compton.<sup>40</sup> It is in Whitehead particularly that we

find a conjunction of ideas between Neoplatonism and dynamic psychology. He subscribes to the emanation concept of the coming-to-being of substances, but notes that "science can find no aim in nature . . . creativity. It finds mere rules of succession" suggesting no external purpose.<sup>41</sup> He notes the *appearance* of purposes but insists these are purblind: "Blind prehensions, physical and mental, are the ultimate building blocks of the universe."<sup>42</sup> This conclusion fully accords with what psychoanalysts have maintained about the *libidinal* urgencies, which Gordon Allport described as "goal seeking,"<sup>43</sup> and Brown discussed as "vectors in the psychobiological field."<sup>44</sup>

It may be questioned whether there is not a non sequitur in the Neoplatonic effort to move from the proposition that the Ultimate One has no personal attributes, to the proposition that the vast array of complex objects of the familiar universe, especially purposing beings who can love and create, have emanated therefrom. Purpose is a higher order, not a lower order of reality than purposelessness, and the capacity to love is almost universally acknowledged to be the "highest" attribute of personality. Whitehead sensed this and departed from the Neoplatonic position in holding that God both transcends and guides His creation. "God is unique in the sense that He provides for the organization and relevance of eternal objects, and 'saves' them by absorbing them into His enduring life."<sup>45</sup> Salvation, then, is not achieved by returning to an impersonal One, relinquishing all that is highest and noblest in personality, but by identifying with that which is still higher.

What is of greatest importance to dynamic psychology is not to test the truth or even the reasonableness of Neoplatonic formulations, but to ask whether they have answered the need of human personalities for some sense of Being in which they can ground their own beings and which cannot be exhausted by the stresses of life. If so, they have served the psycho-integrative purposes which Freudian thought requires of any religious or philosophical system. Erich Fromm said it well: "The problem of religion is not the problem of God, but of men; religious formulations and religious symbols are attempts to give expression to certain kinds of experience. What matters is the nature of these experiences. The symbol system is only the cue from which we can infer the underlying reality."<sup>46</sup>

Persuading the followers that the "underlying reality" is truly present and adequately expressed in such symbol systems as sacred writ, sacraments, or reasoned argument about becoming one with the All is the task of the religion or philosophical system in question. Meanwhile, because we are unavoidably psychosexual creatures for whom even such concepts as love, justice and compassion for the naked and hungry have quite physical implications, Neoplatonism in both its Jewish and Christian forms has more Freudian aspects than is generally admitted. Both are deeply concerned with questions of our destiny, and thus of our becoming.

Wayne Oates listed what he calls "the spiritual goals of man's becoming: meaningfulness, direction, balance, community, maturity in love, and integration."<sup>47</sup> If the Neoplatonic ontology can provide what Whitehead calls "the vision of something which stands beyond, behind and within the passing flux of immediate things; that gives meaning to all that passes," it will have proved to be more than a mere substitute for religion. It will qualify for the definition in the oldest sense of the term: *re-ligio*: to bind back (to the Source). Such a vision, as Whitehead reminds us, is "the one element in human experience which persistently shows an upward trend (and) is our one ground for optimism."<sup>48</sup> It has thus also satisfied the interests of dynamic psychology.

### Notes

1. Edoardo Weiss in Franz Alexander, ed., *Dynamic Psychiatry*, (Chicago: University of Chicago Press, 1953), 44: "The forces operating within the mind are subjected to what we call 'the integrative principle' which characterizes biological processes. The organism and its structural parts form a coherent unity manifesting the tendency to preserve itself."

## PREFACE

R. Baine Harris

Those who dismiss Neoplatonism as only a form of religious mysticism are often not aware that Plotinus does have a fairly well defined philosophy of science. It is not a philosophy of science in the modern sense of an explicit treatment of the specific philosophical basis of each natural science and its problems, but he does have a systematic philosophy of nature. If we were to stretch the meaning of the term a bit, he could even be labeled a naturalist. He once said "All things there are here." His philosophy of nature is an effort to look at natural phenomena and imagine what sort of structure must be behind it. As such, it is not derived solely from thinking about our experiences of nature, but is rather a rational proposal of the hypothetical nature of that which is behind what we see in nature. It is a generic philosophy of science that is not limited to the limits of science and thus is not restricted to any particular conception of science or any particular scientific conceptions. Even though it is about the natural universe of science, it is philosophy, not science.

Plotinus was an unqualified monist. He was not really an idealist, at least not in the sense that Hegel and the German and British Post-Hegelian uses the term, even though he does affirm the immateriality of the One, the ultimate source of all nature and being. Only the One, however, is strictly immaterial. Principles of being have a certain materiality. Every living thing is a soul; and souls are mainly principles of material bodies. Nothing in his philosophy precludes an empirical consideration of natural phenomena, even though he cannot be called an empiricist.

The essays in this volume were specially commissioned by the general editor some twelve years ago and this book has been ten years in

the making. Two of the writers, Ronald F. Hathaway and Reiner Schürmann have died in the meantime. All of the writers are recognized scholars of Neoplatonism with other publications in the field.

The purpose of the volume is to show that Plotinus does have a *de facto* philosophy of the nature and role of science embedded in what he has to say about the nature of the natural universe, albeit not a modern one. In contrast to those in the other volumes of this series, these essays were not presented at one of the international conferences of the International Society for Neoplatonic Studies. In the main they constitute an analysis of the Plotinian view of the nature of nature, rather than a consideration of the impact that the Neoplatonic conception of nature has had in the development of Western science and philosophy, a project that still very much needs to be done.

September, 1995

We wish especially to acknowledge and thank Vivian Holland and Monica Wagner in the College of Arts & Sciences' manuscript office at the University of San Diego for their expert work in preparing this volume for publication. [Ed.]

## INTRODUCTION

Michael F. Wagner

The essays in this volume explicate main features of Plotinus' understanding of the natural universe set forth in his collected treatises, the *Enneads*, as they relate to his Neoplatonic approach to understanding existence and reality—as they relate, in other words, to his metaphysics. A recurring theme here pays special attention to features of Plotinus' philosophy of Nature which are also pertinent to the history and philosophy of science. Ronald Hathaway initiates this theme by examining several discussions in the *Enneads* of natural phenomena in terms of two notions commonly associated with natural science: that the material universe is uniform with respect to the results of natural science, whose methodology involves an interplay between observation and theoretic conjecture and innovation.

This latter notion also serves as one way to address whether Plotinus' Neoplatonic approach and metaphysics comports with science as an ongoing activity or discipline; in other words, whether Plotinus' own philosophy of Nature may legitimately be counted among those associated with the emergence and development of natural science. Jonathan Lee parses this variation on the theme in terms of the degree of independence and (or) dependence which Plotinus' Neoplatonism accords natural science *vis-à-vis* metaphysics and he especially examines relationships between certain of Plotinus' metaphysical (or 'dialectical') conceptions and his understanding of physical things and processes.

Inasmuch as a number of those conceptions have a vitalistic dimension and etymology, Anthony Preus next considers features of Plotinus' understanding of the natural universe which pertain specifically to biological science. In so doing, he examines similarities and differences between a properly Plotinian approach to understanding biological phenomena or processes and the Aristotelian approach, and ways in which Plotinian vitalism may be conceptually related to the evolutionary perspective commonly associated with the emergence of biology as a distinct science.

Scientific explanation and natural laws are fundamental topics in the philosophy of science. Natural essence and causality, in turn, are fundamental topics in the historical development of scientific conceptions of explanation and lawfulness. Accordingly, Lloyd Gerson examines Plotinus' (re)conception of the Platonic image-relation between natural existents and their metaphysical causes, or archetypes, especially *vis-a-vis* the notion associated with Aristotelianism known as *essentialism*; and, Sara Rappe considers more thematically various notions of causality in establishing the significance and meaning of Plotinus' related doctrine that the real existence of individual things or processes depends upon the metaphysically singular 'descent' of the natural universe from its archetype.

In the first of his two essays in this volume, Gary Gurtler explicates further key texts in the *Enneads* pertaining to Plotinian archetypal (or, archetypically lawful) causality, especially as it relates to the Platonic conceit that Nature is a moving image of eternity and to the Hellenistic notion of Providence, as this notion was introduced into scientific discourse by Stoic philosophers. The contrast between Plotinus' conception of Providence and the Stoics' is also highlighted by the fact that it was the latter conception which emerged in Early Modern philosopher-scientists' understanding of the natural universe as a deterministic system. Laura Westra thus discusses the place and meaning of freedom in Plotinus' philosophy, including its relation to his conception of Providence, and she also examines its significance for Plotinus' related understanding of human beings as persons and as moral agents.

In addition to notions of causality and lawfulness, the historical development of natural science owes much to at least three other features of classical Greek thought: its application, especially in the Pythagorean and Platonic traditions, of mathematical concepts to Nature; its notion of a minimal set of explanatory or causative principles and the possibility

even of a single first-principle of all reality, including Nature; and its notion(s) of matter, or a material principle. Accordingly, Aphrodite Alexandrakis explores Plotinus' use (and modification) of certain Pythagorean conceptions in his own understanding of the natural universe; Reiner Schurmann explicates the nature and function of Plotinus' first-principle of reality (the One) in what he argues is more properly termed Plotinus' *henology*; and William Carroll examines the main texts in the *Enneads* where Plotinus discusses the notion of matter, its nature and (or) function and whether it is a real principle.

These (and previous) essays attest, moreover, to the subtlety and originality of Plotinus' Neoplatonism and his cognizance of previous philosophers and traditions. In this regard, two additional major features of Plotinus' understanding of Nature are his critique of Aristotelian categorial theory, explicated here by Christos Evangelou; and his adaptation, examined next by Gary Gurtler, of the (Stoic) notion of *sympathy* as his primary conceptual nexus for relating natural phenomena and causal processes to his Neoplatonic understanding of existence and reality. In this volume's final essay, I offer additional historical considerations regarding the relationship between natural science and metaphysics; and I examine the special place in Plotinus' understanding of Nature of dynamic conceptions related to the classical Greek notion of *becoming* as well as Plotinus' special place in the history of responses to Skepticism, a history which also shaped and defined much of the history of scientific thought itself.

Of course, this thematic introduction hardly does justice to the wealth of issues, materials, ideas, and explicative details to be found in the essays comprising this volume.

# **PLOTINUS AND THE POSSIBILITY OF NATURAL SCIENCE**

**Ronald F. Hathaway**

Is there room for natural science in the philosophy of Plotinus? The question has seldom, if ever, been raised.<sup>1</sup> There are two obvious general reasons for this. The first is the inferior role assigned to matter and the sensible realm by Plotinus, with obvious negative implications for any empirical science. The second is the general absence of natural science in those cultures in which Plotinian Platonism flourished. Some would argue that the question of natural science in Plotinus is pointless because Plotinus' metaphysics reduces to a form of mysticism, and mysticism and natural science are incompatible.<sup>2</sup> A view more worthy of our attention could be inferred from Duhem's claim that it is impossible to derive all the elements needed for the construction of a physical theory from a purely metaphysical system.<sup>3</sup> If Duhem's principle is correct, and if Plotinus' philosophy is in fact a purely metaphysical system, then no definite natural science could be derived from it. Duhem's principle can be regarded as a circumspect formulation of an old suspicion that all ancient philosophies are attempts to derive physical theories from metaphysical principles.<sup>4</sup>

This suspicion is not without substance; however, recent work in the philosophy of science compels us to reappraise the basis of the suspicion itself. The search for epistemological and metaphysical foundations of scientific theories is now seen as being so central in the history of philosophy that Frederick Suppe can say that the history of epistemology and metaphysics is the history of the philosophy of science.<sup>5</sup> It is challenging to extend the application of Suppe's opinion from the modern era which he clearly has in mind to the history of ancient philosophy. Recent research in ancient physical theory, on Plato's theory of elements, on Aristotle's embryology and animal kinesiology, and on Stoic physics has uncovered an interplay between ancient physical theory and ancient metaphysics that raises significant issues in the philosophy of science.<sup>6</sup>

Can one make an analogous claim by reconstructing Plotinus' theory of material body and the sensible realm, or does his metaphysics shut out the existence of natural science in any sense intelligible to us? The answer can be found only by a closer examination of Plotinus' physical theories, especially in *Ennead* II, and of Plotinus' occasional thoughts about natural theory as such; to which I shall turn in a moment.

The historical argument according to which Plotinus' metaphysics and the cultures with which it had an apparent affinity caused the stifling or neglect of natural science raises issues well beyond the scope of my present remarks. However, the historical argument raises one issue that is central to my purposes. It is an issue that surfaces when we ask the following counterfactually phrased question: If Plotinian Platonism had dominated modern European culture, would natural science as we know it not have emerged? Or would there have emerged a different natural science based on the organic and dialectical model of Plotinian Platonism? It is conceivable that the cultural substratum and Plotinian Platonism could have taken independent courses of development. Clearly, the issue posed is what we mean by natural science. It is senseless to ask whether natural science is possible in Plotinus' philosophy until we assign definite content, however general, to the notion of natural science as we know it.

# I

It would beg our question from the beginning if we either assigned a content to the notion of natural science that is inadequate or false for modern science, or if we wholly excluded resembling yet different models of science, for instance, models constructed with organic or holistic assumptions. For brevity's sake, I have reduced the notion of natural science as we know it to two broad truisms. The first is that natural science postulates that the material universe is uniform; whatever explains the properties and processes of matter in one part of the universe explains the same properties and processes in every other part of the universe. I will call this *The Galilean Thesis*.<sup>1</sup> The second truism is that natural science is a disciplined empirical inquiry consisting of a body of theoretical conjectures, as distinguished from rational speculations; changes in this body of conjectures are governed by definite practices and rules, in particular by a high level rule that makes all propositions of scientific theory subject to a test in which both observation and theoretical

innovation play their parts.<sup>2</sup> This second truism I call *The Principle of Empirical Scientific Inquiry*.

To take the Galilean Thesis first, does Plotinus believe in the uniformity of matter and in a uniform explanation of material properties and processes? Plotinus accepts the Platonic dualism of sensible and intelligible realms; but this dualism does not answer our question, since it is conceivably compatible with various kinds of physical theory. The question is whether Plotinus is a dualist with regard to the sensible realm alone. I will call monism and dualism relative to the observable realm *physical monism* and *physical dualism* respectively. If Plotinus is a physical dualist, this would count as evidence against his holding the Galilean Thesis.

In some passages, Plotinus accepts a strong differentiation of sublunar and celestial phenomena (II.1.5). In Plotinus' cosmology, the inferior level of soul, the 'generative soul' in matter (II.3.17), does not as firmly hold and control the material constituents of bodies in the near-earth region as it does in the celestial sphere. In the near-earth region, "it is not the individual thing which lasts forever, but the unity of form" (II.1.9, 9-10).<sup>3</sup> Plotinus thinks that the sun and stars existed in the past always and will always exist in the future as individuals (II.1.8) because they are more directly controlled by the superior level of soul, although he is genuinely perplexed about how this can be true. He thinks that the circular motion of the celestial sphere is constructed in imitation of the Intellect (II.2.1)—which implies an even stronger dividing line between motion governed by the superior soul, which receives forms directly from Intellect (II.3.17, 15-17), and motion governed by the inferior soul, whose rational forms (*logoi*) are not the originals (II.3.17, 19). This dualism leads Plotinus to question the relatively uniform distribution of matter in the cosmos. He asks whether fire is the only element in the celestial sphere, and whether it is in flux, like other bodies (II.1.6). At IV.1.6, 57-60, he bluntly claims that "to lift up earth into the celestial sphere is against nature and opposed to her regulations."

A clearer indication of physical dualism is found in Plotinus' theory of light (*phōs*). He interprets Plato's light "other than flame" (*heteron phlogos*: *Timaeus* 58C5-7) as being a body. This light distinguishes the sizes and colors of the stars (II.1.7, 43-46) and composes "the rest of the celestial sphere" (46-47). It is visible in the stars but invisible in the night sky because of its fineness, nonreflective transparency, and distance. From light of this kind there can be no outflow (*aporroē*). It is the purest body in the purest region, and a kind of fire. It is body "joined with soul" (*meta*

*psychēs*), and a body with a higher status than body "alone by itself" (II.1.8, 6–7). This implies a dualism of types of body. Plotinus further distinguishes a second kind of light which "shines from [the first], having the same name, which [second kind] we say is bodiless" (*asōmaton*). Plotinus is evidently referring to radiant light coming from the sun. The first kind of light is a body, partly visible, partly invisible. Radiant light, the second kind, is bodiless and in this regard seems to resemble the intelligible realm (Cf. II.1.8, 27–28). The first kind of light has physical properties such as fineness, transparency, and distance, and by it one can distinguish sizes and colors. The second kind of light, which Plotinus could have detected as the glow surrounding the sun, is only problematically a physical thing at all if it is without body. Stellar fire of this radiant kind differs in some seemingly irreducible way from terrestrial fire. This radical discontinuity within the observable order suggests again that Plotinus is a physical dualist. This implies the denial of the Galilean Thesis.

I turn next to Plotinus' attitude toward physical theory as a form of inquiry governed by a method in which observation plays a role. For Plotinus, the highest form of theoretical inquiry requires us to "cut away everything" (V.3.17)—sensible substances, their properties, and our mental representations of these. But when Plotinus is thinking in this vein, he is not thinking of physical theory. Thinking of the physical universe, he grants that forms are embedded in sensible material bodies. Do our minds gain the kind of access to these forms that enables us to attain theoretical insight? What kind of theoretical enterprise is involved? The road to insight and knowledge is dialectic, which deals with real beings, forms or rational principles (Cf. II.4.16, 2–3), not with sensible things, which are objects of opinion (I.3.4, 9–12). In dialectic, theoretical statements (*theōrēmata*) and the things about which they are true are grasped at the same time (I.3.5, 12–13). Physical theory (*peri physeōs theōria*) is a different part of philosophy. It theorizes "about nature by borrowing help from dialectic, as other crafts make use of arithmetic; but it stands nearer to dialectic [than the other crafts stand to arithmetic]" (I.3.6, 2–5). What Plotinus means by the relation between the crafts and arithmetic is unclear. He might mean that arithmetic is only instrumental in the activities of the other crafts. Or, if we believe Porphyry's accounts of Plotinus as having thorough knowledge of geometry, mechanics, optics, and music (*Vita*, 14), he could mean that other crafts are theoretical skills that are parts of a more general theoretical system within which they draw certain of their 'theorems' from number theory—one possible meaning of *arithmētikē*. A

third interpretation is also possible. If Plotinus knew Eratosthenes' works, or had read other reports of the Academy's work on the Delian Problem, he could be thinking of the way in which crafts like architecture seek help from branches of mathematics in the form of proofs of the possibility of certain physical constructions."

I cannot pause to canvas separately these interpretations. What seems clear is that Plotinus' claim that physical theory is closer to dialectic than other crafts are to arithmetic implies that the former relation cannot be only technical and instrumental, but must involve some more integral and systematic relation, either in the field of inquiry or in methodology. If the affinity between dialectic and physical theory were this close, the test of the truth of physical theories would more likely be truths about forms embedded in matter yet apprehended as intelligible, not observable. Hence it seems doubtful that observation can play any direct role in testing physical theories for Plotinus. This implies the denial of the Principle of Empirical Scientific Inquiry.

Since Plotinus seems to reject both of our truisms about natural science, it seems to follow that natural science as we know it is impossible inside the framework of his philosophy. Until now, I have argued that a *prima facie* case can be made for this conclusion. Unfortunately, this *prima facie* case needs careful qualification, as we shall see. Plotinus remains honestly perplexed about both physical dualism and about the validity of observation as a test of the truth of physical theory.

## II

The passage in which Plotinus distinguishes stellar fire as body joined with soul from body by itself alone (II.1.8, 6–7), which implies radically differing types of body, is misleading. Elsewhere he thinks of soul as extending to the lowest levels of sensible reality (Cf. II.3.18). Strictly speaking, there is no body alone by itself anywhere. The entire observable order has body (II.1.1, 2). Every body has shape or form (II.4.3, 14–16).<sup>1</sup> Form, or the traces of form, are imprinted in generative soul. Since Plotinus argues that there must exist something that underlies the sizes, shapes, and volumes of bodies to explain their intertransformability, viz. matter (II.4.6), the entire observable order for Plotinus is material body. Does Plotinus really reject a uniform explanation of the observable cosmos?

It is useful to consider the details of one of his arguments dealing with physical theory. His line of thought in his treatise 'On the Celestial Sphere' is not a dogmatic monologue, but an inquiry filled with doubts.<sup>11</sup> "We say" that the universe exists eternally, but something more adequate than the will of God is needed to explain this (II.1.1). It is possible that God causes the cosmos to persist not as a particular, but as a form imposed on an endless succession of individuals, like living organisms. Why should terrestrial animals persist in form only while celestial bodies persist as particulars if the cosmos is itself an organic whole? Plotinus, as a matter of honest perplexity, is raising a question about a uniform cosmos. At first (II.1.2), he thinks tentatively: If we accept the opinion (*doxa*) that the celestial sphere and all bodily things in it last forever as particulars (*to tode*) and sublunar things last forever only in form, one then has to show how anything having body can persist forever as a particular, when body is always in flux.<sup>12</sup> Since Plotinus rejects Aristotle's fifth body as a special explanation of the eternity and continuous motion of the celestial sphere, and also rejects the Stoic theory of an immanent eternal fire, this problem is fundamental for him.

He starts his resolution of this problem by assuming with Plato that the cosmos is a "universal living thing" (*to pan zōon*) (II.1.3, 30). In a Platonic cosmobiology this analogy entails that the cosmos, like any organism, has both body and soul. If, then, the celestial sphere is an eternal particular (II.1.2, 19), it is to both soul and body, to soul alone, or to body alone, that it must owe its eternity. But body is not indestructible, so it alone cannot furnish the explanation. Soul alone cannot furnish one either, since Plotinus thinks that the cosmobiological analogy requires an indissoluble connection between cosmic soul and cosmic body; the soul of the cosmos is an inseparable soul. It follows that "the matter and body of the totality" (II.1.3, 1) must contribute in a synergistic way to the eternity of the whole. How can this be explained? Plotinus at first tries a weak compromise by suggesting that body is in flux but not in total flux. He argues by appealing to observation of terrestrial instances: "One must observe" (*horan de dei* II.1.3, 5), he writes, that individual organisms and we too remain the same despite changes of constituents, just like the whole mass of the earth and water (II.1.3, 7–10). Sublunar particulars thus have two kinds of persistent identity: (a) sameness of kind or form, and (b) relative sameness as physical individuals. Plotinus infers from this observational generalization that stellar fire is (perhaps) not in the kind of flux that would undermine the synergism of cosmic body and soul that produces stability. Stellar fire is tractable (*eugrēnos*: II.1.3, 18). But is

stellar fire tractable enough to compose an eternally persistent particular? Let us note here, aside, that Plotinus' appeal to observation seems to commit him to argue from truths about the near-earth sensible region to truths about the celestial sphere. His problem is that the (b) type of persistent identity still falls short of the absolute eternal sameness demanded by partisans of an eternal celestial sphere.

Here Plotinus vacillates. In II.1.4 he contends that because celestial fire is immediately governed by soul, it at least is not in a "boiling state" (*zesis*) (Cf. Aristotle, *Meteorologia* 340b23). He appeals again to a fact of observation: "Even if [the elements of a thing] are continually changing [e.g. wearing out like pieces of wood], the whole remains." It is thus possible that stellar fire boils as a whole mass but remains as a mass or distinct body. Again he refers to soul concessively: "Even if it were possible for all body to perish, nothing would happen to alter soul" (II.1.4, 32–33). Obviously, he is unwilling to concede this much—that the bodily component of the cosmos could entirely perish—since it is a necessary synergistic condition of the identity through time of the cosmos. He thus retreats to a new position: The bodies that compose the cosmos, stellar fire, are "pure and in every way better" (II.1.4, 8), i.e. better than terrestrial bodies. In what sense does Plotinus ascribe higher value to stellar fire? To say that those bodies are better because eternal would reverse the order of explanation. Plotinus' ultimate reason is based on his cosmobiological analogy: In other organisms, "nature selects and places the better things in their most important parts" (II.1.4, 9–10). The celestial sphere is the most important part of the cosmos, the universal living organism; so, Nature has selected and placed stellar light there. Plotinus construes his Platonic analogy in the strongest sense, as entailing an organic internal organization analogous to terrestrial organisms. Again let us note that his argument depends on the observed nature of terrestrial organisms.

His view of the universe as organized and as persisting through time in the same way that organisms persist as individuals allows for a kind of uniformity in nature, namely an organizational uniformity. But, as he notices, it presents an even greater problem. Why does the cosmic organism not ultimately perish, like all other organisms? Plotinus' explanation depends on a double appeal to Plato's authority in the *Timaeus*. The first depends on the mythic aspect of the text, and I will not dwell on it here.<sup>13</sup> The second involves a serious attempt to reinterpret what Timaeus says about stars having been composed "mostly" (*tēn pleistēn*) though not entirely, from fire (cf. II.1.6, 10 with *Timaeus* 40A2–3).<sup>14</sup> Plotinus realizes that Plato seems committed to the view that stars are solids (II.1.6, 6), and

that an element other than fire is probably required to explain this. This implies that Plato is one of those, to whom Plotinus referred earlier, who hold that the body of the celestial sphere is composed of the same elements of which organisms are made (II.1.2, 14–17). If Plato holds a version of this theory of the relatively uniform distribution of physical elements, there would be no need for a special kind of fire, like Plotinus' light. Anticipating his own theory of light, Plotinus appeals weakly to the fact that Plato distinguishes different kinds of a given element, e.g. different kinds of earth (II.1.7, 33–34), and even refers to gold as a kind of water (II.1.6, 51–53).<sup>26</sup> Yet Plotinus knows that Plato does not give stellar fire any *ad hoc* special status. The implied relatively uniform distribution view is troubling to Plotinus. The notion that organisms and stars are composed of the same matter is an anti-Aristotelian uniformity of elements position (and it is incidentally in striking agreement with the modern theory that the material of organisms is the residual product of stellar evolution). This uniformity of elements position troubles Plotinus because even though he rejects the Aristotelian fifth element theory, he continues to think of stellar fire as occupying a privileged place in the cosmos. His position thus looks like an uneasy truce with the Aristotelians, or an attempt to harmonize Plato and Aristotle.

Plotinus' final resolution of his own position is found at II.1.7. The stars are solids, but it is not the element earth that explains their solidity; but it is a quality ('resistance') normally associated with earth. Physical qualities such as resistance, density, hardness, and brightness can be gained or lost or intermixed independently of the elements with which they are normally associated. It is not physical elements but physical qualities that are relatively uniformly distributed through the cosmos. Plotinus refers to this general idea as "the community in the cosmos" (II.1.7, 15). By this he does not mean the Stoic notion of universal *sympathy*, which is explained by an immanent universal fire and entails physical monism. Plotinus' view amounts rather to the independence and associativity of qualities admitted as a universal high-level feature of the cosmos. Therefore, in two ways Plotinus' argument turns on high-level features: the ordering of parts of the cosmos according to the cosmobiological analogy, and a principle of independence and associativity of physical qualities.

This long detour through Plotinus' treatise on the celestial sphere enables us to assess more fully his position relative to the Galilean Thesis. The Galilean Thesis is both a doctrine of the relative uniformity of matter and a doctrine of the strict uniformity of physical explanations. Plotinus rejects a relatively uniform distribution of material elements, but he accepts

a notion of uniform physical explanation. This is what his reference to 'the community' in the cosmos means: The kinds of the element fire are not uniformly distributed—stellar fire does not flow downward (II.1.8) and terrestrial fire is prevented from reaching beyond the near-earth region (II.1.7)—but they both have the quality that makes them solids. The community or association (*koinōnia*) in the cosmos is an association of common qualities. If physical explanations using the same physical qualities are the same kinds of explanations, then Plotinus' notion of the cosmic community of physical qualities entails uniformity of physical explanation. In this respect, he accepts the Galilean Thesis.

Plotinus' notion of explanation in terms of qualities or properties independent of material constituents or physical elements raises serious questions. What is the physics of complex properties compounded of other properties? How can Plotinus appeal to the authority of Plato's *Timaeus* when he avoids the Timaeian theory of physical elements as intertransformable, geometrically defined components of the regular solids, in which the ultimate constituents and properties of fire supply a uniform and interconnected explanation? Plotinus follows his Middle Platonist predecessors in avoiding any detailed investigation of the Timaeian theory.<sup>27</sup>

### III

Turning once again to the Principle of Empirical Scientific Inquiry, can anything be added to our initial judgment of Plotinus' position? I have noted that Plotinus appeals to observation. To these cases one can add other, more telling cases of Plotinus' use of appeals to observation. For instance, in discussing the physical explanation of "complete coalescence" (II.7.1 & 2), his use of Alexander presupposes close attention to the phenomenon of the expansion of wetted papyrus pulp. Plotinus rejects atomism, since he holds that bodies are completely divisible (II.4.7, 20–22). The expansion of wetted pulp is for him a case of complete interpenetration without complete division.<sup>28</sup> His resolution of what he calls "these difficult questions" (II.7.2, 42–43) involves defining the quality of density (*pyknotēs*) as itself made up of other qualities (II.7.2, 35–37). The pulp expands because it is interpenetrable, and its interpenetrability is explained by its relative density. Interpenetration is explained by the mingling of the qualities of the water and the papyrus. The absence of division of the water and pulp by one another is explained by his theory that qualities "can go through bodies without cutting them"

(II.7.2, 28–29) because they are “bodiless” (II.7.2, 29). His notion of bodiless qualities may seem like a metaphysical speculation without any clear justification; yet the purpose of his reasoning is the attempt to make coherent sense out of the observed facts. For Plotinus, *interpenetration* is a theoretical term whose definition rests on an account of the nature of qualities, and his introduction of the theoretical meaning of the term is part of an attempt to determine which descriptions are to count as the facts in need of explanation, as well as part of an attempt to explain the facts. Admittedly, Plotinus does not clearly distinguish this kind of determination of a domain of facts from their explanation.

This intimate pairing of observation and theory may be found in many of Plotinus’ discussions. The soul that regulates the celestial sphere also enters the realm subject to chance (*tychē*: II.3.10). The stars produce nonessential changes in terrestrial things. The higher and lower levels within the sensible realm interact, which suggests that they must share common general descriptions; there is a common repertoire of physical theoretical terms. In general, all sensible matter is formed in some way and is thus a proper object for physical theory (II.4.3, 16–17; II.2.1, 38–39). But does Plotinus imply the general view that physical theories must as such be open to a test of adequacy such that not reason alone but observable facts must be appealed to, even if indirectly?

A prior, more central question is this: Did Plotinus have even the idea of physical theory as only *partially* justified or contestable? In particular, we ought to ask what his attitude was towards the doctrine of physical theories as partially justified or ‘probable’ accounts that is the cornerstone of Plato’s *Timaeus*. Plotinus refers to this doctrine indirectly in the passage already cited (II.1.6) in which he asks whether celestial bodies are made of fire only or of fire and other elements.<sup>24</sup> Contrary to his normal usage, there Plotinus does not cite Plato’s text with “He says,” but with the words: “For *Timaeus*... the stars contain not all fire but mostly fire, since the stars obviously have solidity” (Cf. II.1.6, 2–6, with *Timaeus* 40A2–3). He says that “perhaps” (*isōs*) *Timaeus*’ view is correct, and in any case Plato “agrees” with *Timaeus* in judging that the view in question accords with what is ‘probable’ (*tōi eikoti*). The fact that *Timaeus* and Plato might not agree underscores the plurality of possible positions that are measured against the yardstick of ‘probability.’ Nowhere else does Plotinus treat Plato and *Timaeus* as holding potentially different positions. As if to excuse this distancing of Plato from *Timaeus*, Plotinus adds a twofold justification of Plato’s position:

From our sense perception, by sight and the exchange of contact [with starlight], it appears that they contain all or mostly all fire; but when we consider them rationally, we see that if there is no solid without earth, they must contain earth.<sup>25</sup>

Plato’s position is supported either by sense perception or by reasoning, or by both. What sense perception reveals is unclear: either stars are composed of fire, or they are composed mostly of fire and partly of other elements. Reason argues that since stars are solids, then if there is no solid without elements other than fire, stars must contain elements other than fire.

Since Plotinus’ own theory of stellar composition requires that stars be composed only of a special type of fire and contain no earth, he in effect rejects the argument from reason alone and accepts one of the two alternative testimonies of the senses—but in any case, he rejects Plato’s position. He later explains that stellar fire is a solid in having resistance (*antereisis*) but not hardness (*sklērotēs*: II.1.6, 48–50). For my purposes, two things are worth noting. Plotinus appeals in a roundabout way to observation, not just to reason. Thus, for him the *Timaeus* account is in fact only partially justified, not only because it is a merely ‘probable’ account, but also because it is an account that is contested both by the evidence of perception and by Plotinus’ countertheory. In this passage, Plotinus proves that he is capable of viewing physical theory as a group of competing theories, of which Plato’s theory of stellar composition is only one, and not necessarily the correct one. It should also be added that Plotinus is exceedingly coy about this conflict with Plato. He wishes to appear not to disagree with Plato.

This rare passage placed Plotinus closer to the spirit of Plato’s doctrine of partially justified accounts than all the passages in which Plotinus accepts Plato as an authority without reservation. It leads Plotinus closer to the idea of physical theory as conjecture, and this is a fundamental step towards a grasp of natural science as a disciplined inquiry. Since it is possibly unclear what I mean in ascribing the idea of a physical conjecture to Plato, I will restate Plato’s position and then, in conclusion, I will evaluate Plotinus’ precise attitude. For Plato, physical theory deals with what “comes to be and is perceptible”; since the perceptible is “grasped by opinion together with sense perception” (28B4–C1), the sensible realm is also properly thought of as an object of changeable opinions (*doxaston*). Physical theories therefore are never ‘exact’ accounts, “in every way in agreement with themselves” (29C5–7). Physics is not an exact science like geometry; it is not an entirely consistent body of theory. The best one can

hope to achieve is accounts that are "no less probable than others" (29C5-D1). Since physical theory is a matter of belief (29C4) and opinion, or at best a mixture of probability and necessity of the kind sought for in the Timaeon theory of elements, the most we can hope to achieve is contestable belief.<sup>2</sup> The choice of a theoretical model at the core of the Timaeon theory of elements is explicitly open to contest. "The prize of the contest goes in a friendly way to the one who refutes this, and discovers that it does not hold in this way" (54B1-2). It is arguable that refutability of a physical theory is a kind of falsifiability.<sup>3</sup> Given this doctrine of refutability together with Plato's strong epistemological distinction between belief and knowledge, the Timaeon doctrine can be said to sever physical theory cleanly from dialectic. Physical theory for Plato is thus advanced as a species of conjecture rather than as a body of rational argument or speculation. In Platonic physics, it must be granted that more weight is given to the choice of theoretical models than to empirical confirmation or disconfirmation—for Plato 'the appearances' are treated as what need to be explained, not what tests theory—but it is not this that should be the important issue, but rather Plato's first fledgling conception of a physical conjecture.

Plato's reference to 'probability' in the passage about stellar composition may have loosened Plotinus' commitment to Plato's own authority—a salutary effect—but it did not serve as a springboard for a Plotinian investigation in the philosophy of science, for instance, in the epistemological or metaphysical foundations of natural theory as such. Plotinus' rare appeals to observation and sense perception, when seen in this light, are but vague pointers towards an empirical criterion; they do not even hint at the more important conception of a physical conjecture.<sup>4</sup>

Plotinus' view that physical theory is closer to dialectic than the crafts are to arithmetic implies that physical theory makes use of dialectic in some systematically close way that would leave little room for the idea of a partially justified or contestable theory. Plotinus does not reflect on the structure of physical theory as distinguished from dialectic.<sup>5</sup> On the other hand, the charge or suspicion that Plotinus is a philosopher who simply derives physical theory from his metaphysical system is not accurate. When compared with the Stoics, Plotinus' metaphysical system does not directly logically entail any consequences in physical theory, although it stands in a constant rapport with it. Plotinus' theories of physical coalescence, of stellar composition and causation, or of the nature of physical qualities are not derived from the metaphysical principles of unity,

intellect, and soul—even though certain references to soul and the 'traces' of its *logoi* are presupposed by them. It is conceivable that the outlines of a Plotinian physics could be put together from Plotinus' accounts of density, interpenetrability, divisibility, transparency, resistance, and other material qualities. This is not to say that it was ever Plotinus' intention to do so.

In conclusion, I have argued that Plotinus' position relative to the Galilean Thesis is ambiguous. The sensible universe is bifurcated into two regions that differ materially because of the overall organization of the biocosm. The two regions share the same physical qualities. Plotinus is not a physical monist like the Stoics. The uniformity of the physical order is not due to an immanent unifying element nor to the relatively uniform distribution of a plurality of elements, but rather to the "community," i.e. the independence, associativity, and relatively uniform distribution of physical qualities. It is in this sense that Plotinus' cosmology rests on an organic and holistic basis. If, then, the Galilean Thesis entails the uniformity of matter, Plotinus' position rejects the Galilean Thesis. On the other hand, if the Galilean Thesis entails only the uniformity of physical explanation, Plotinus' position is at least compatible with the Thesis. As for the second of my truisms about natural science, it is clear that Plotinus has no well formulated idea of physics as an empirical inquiry or even as a body of physical conjectures. On balance, we might be able to speak sensibly of a 'Plotinian physics,' but this physics would lack certain of the key ingredients of physics as we know it.

6. Cf. Gregory Vlastos, *Plato's Universe* (Seattle, 1975); Aristotle, *De motu animalium*, edited and translated by Martha C. Nussbaum (Cambridge, MA.); Robert B. Todd, "Monism and Immanence: The Foundations of Stoic Physics," *The Stoics*, ed. John M. Rist (Berkeley, 1978), 136–160. Of special interest is Montgomery Furth's forthcoming work on the metaphysical foundations of Aristotle's biological theory. See also *Science and Speculation: Studies in Hellenistic Theory and Practice*, ed. Jonathan Barnes, Jacques Brunschwig, Myles Burnyeat, and Malcolm Schofield (Cambridge, 1982).
7. At the time that Ficino translated Plotinus into Latin (1485, published 1492; cf. P. Kristeller, *Suppl. Ficinianum*, lxvi), Italian science combined mechanical explanation with teleological, organic, and holistic explanations taken from a variety of Aristotelian and Neoplatonic sources; Italian culture and its physics could have branched in any of a number of directions. Plotinian modes of thinking had been embedded in Christian culture by the anonymous Pseudo-Dionysius. Critical reaction to the 'fraud' implied by Valla's suspicions about the provenance of the Dionysian Corpus (published in 1505 in the *Annotationes* by Erasmus) may be one significant reason for the loss of respectability of Plotinian Platonism among many scientists and intellectuals. Such adventitious events independent of scientific theory often play a role in the choice of models of scientific theories.
8. Because of Galileo's well known role in publicizing the view (not fully extended until Newton). Does the Galilean Thesis still hold for physical science? At the 1982 Cambridge Conference on Particle Physics, a new version of what has come to be called the 'inflationary [cosmological] model' was put forward by Steinhardt and Albrecht (and independently by Linde) which implies that the totality of the observed universe is merely a local universe cut off from very remote 'universes.' Moreover, the Steinhardt-Albrecht-Linde version allows different physical laws as a possibility for these remote universes, and thus implies both real space-time discontinuity and explanatory non-uniformity. However, their version is so conjectural that it would be false to say that physics has adopted anything like it. Most physicists continue to hold something like the Galilean Thesis.

9. Theoretical innovation enters the test of theories as background in determining a given domain of facts. I have merely tried to encapsulate accepted positions here, holding controversy at bay. In particular I omit any reference to the contents of a 'body of conjectures,' especially any reference to claims to knowledge. If Plotinus accepts Plato's cosmological epistemology, natural science would not be a body of claims to knowledge, a position that would challenge contemporary discussion and only raise a multitude of troublesome questions.
10. All citations are to the Henry-Schwyzler edition, *Plotini Opera* (Paris, 1951–1959). All translations are my own, though I have profited by consulting Armstrong's *Plotinus* (Cambridge, MA, 1966–1988.).
11. 'Celestial sphere' seems to me to be less misleading than 'heaven' as a synonym of *ouranos*. That what is meant is neither the ancient sphere of rotation nor the celestial sphere of the modern astronomer will be clear from context.
12. Eratosthenes, *Platonicus*, as cited by Theon of Smyrna, ed. Hiller (Leipzig, 1878), 2. For a discussion, Cf. B. L. Van der Waerden, *Science Awakening*, translated by Arnold Dresden (Oxford, 1961), 150, 160–161.
13. II.4.3 says that all sensible matter has shape, but it is clearly only as body occupying place that matter is shaped. Does Plotinus regard a proposition such as 'All body has shape' as true in virtue of sense experience or as a truth of reason, a 'dialectical' truth? For the role of observation in Plotinus, cf. below in this essay.
14. Against this, W. Theiler, "Plotin zwischen Plato und Stoa," *Les Sources de Plotin* (Vandoeuvres-Genève, 1957), 68: "Plotin auch [hat] nicht Dialoge geschrieben. Fragen wurden gestellt in seiner Vorlesung (Vita 13), aber die Antworten lagen schon fest. Philosophie und Leben waren monologisch geworden." (My italics.) Theiler's general contention that Socratic elenchus is absent from Plotinus' view of Plato is correct, or so I have argued in "The Neoplatonist Interpretation of Plato: Remarks on its Decisive Characteristics," *Journal of the History of Philosophy* VII (1969), 19–26. On the importance of elenchus further, Cf. n27 below.
15. Literally, "in saying (*legontes*) that the cosmos has always existed before... if we refer (*anagoimen*) the explanation to the will of God..." (II.1.1, 1–3). It is grammatically correct to render *legontes* as "when we say," as Armstrong does, but it misses the tentative mood of this opening sentence. Armstrong's comment that the whole purpose of II.1 is "to defend the doctrine... of the incorruptibility of the heavens" exaggerates the dogmatic character of Plotinus' thought in II.1. MacKenna's "We hold that..." is too strong. The persons implicit in *anagoimen* are not necessarily restricted to Plotinus and his followers; note that the view in question is not easy to reconcile with Plato's position (Cf. II.1.2, 8–10, with Republic 530B2–3, but on *Timaus* Cf. VI.7.3). For an instance in which Plotinus is making an apparently dogmatic

- claim, Cf. the *phamen* at II.1.7, 27.
16. II.1.2, 1–6. The stars, sun, and planets are eternal particulars “in the strongest sense” (*epi tou autou kyriōs*). Plotinus’ explanation of just what this means (*hōs to kath’ hekaston kai to hōs autōs*: II.1.2, 5) is obscure. On different kinds of persistent identity in Plotinus, Cf. below in this essay. Stars are not changeless in every way (II.1.8, 27–28).
  17. I borrow this term from Todd, “Monism and Immanence,” 147.
  18. The argument is that celestial things are derived from the Craftsman or Intellect, but terrestrial organisms derive from or are produced by gods produced by the Craftsman; since the celestial gods made by the Craftsman are instrumental in producing terrestrial organisms, they therefore cannot be instrumental in producing themselves.
  19. On this passage, cf. below in this essay.
  20. *Timaeus* 59A8–B4, viz. a dense, uniform, fusible kind of water (*hydōr*). Plato’s use of *hydōr* in this and other passages suggests that he means by it any substance found in liquid form. The example seems irrelevant here, but may be important for Plotinus’ later notion of separable qualities like density (*pyknotēs*).
  21. John Dillon, *The Middle Platonists: A Study of Platonism 80 B.C. to A.D. 220* (London, 1977), 48–49: “I can discern no sign of philosophic questioning behind Albinus’ summary of Platonic physical theory... If the Middle Platonists seem uninterested in questions of what we would term Physics, they are after all only reflecting the remarkably nonscientific bias of the age in which they lived.” Dillon’s comment furnishes a good example of what I referred to above as the historical argument. The bias of the culture and Middle Platonism are mutually affined; they reflect each other. One ought to note that ‘the age’ in question produced such outstanding scientists as Heron, Ptolemy, Theon and Galen, and that familiarity with Plato, Aristotle, Euclid, Archimedes and Apollonius should have been taken for granted. Why do we think that people like Albinus reflect a bias, like innocent and passive mirrors, rather than actively choosing to adopt a bias?
  22. If there were complete division, the pulp and the water would completely destroy each other. Every volume of matter is a continuum (Cf. II.7.1, 32).
  23. II.1.6, 8–12. II.1.7, 46–50, implies the denial that there is no solid without earth; it also implies that fire is a solid but is neither three dimensional nor hard. The implicit denial that fire is three dimensional seems to imply the rejection of Plato’s Timaeon polyhedral theory of the elements.
  24. It is probably necessary to note here that the term *eikos* as it is used in these passages in the *Timaeus* (cf. note below re Kepler) has nothing to do with probability in the sense of frequency of occurrence. Burnyeat’s comments about Aristotle’s notion of *eikos* involving a subjective element—viz. what most or some people would grant as being convincing or acceptable—apply, at least in part, to Plato as well. Cf. M. F. Burnyeat, “Carneades was no

- Probabilist,” paper read at the Colloquium on Ancient Scepticism (Princeton University, 1982), 7–10.
25. *Timaeus* 53D5 & 56B4. At 59D1 the search for more adequate physical theories is said to involve a pleasure that imparts a kind of measured quality (*metrion*) to life, a measure characterized both by playfulness and shrewd thinking. Plato is thinking here, possibly, of the contest described at 54B1–2.
  26. It is unclear what Plato’s idea of the adequacy of a theory amounts to. It may involve questions about how well one’s theoretical model captures certain features of its domain of facts, e.g. as the sharp vertices of his tetrahedra capture the ‘cutting’ quality of fire. If the only question for Plato is how ‘admirable’ (*kalon*) one’s model is (54A6), adequacy would depend on standards of elegance or symmetry. I believe that Plato’s yardstick for adequacy involves at least both of these questions. Had he developed his idea of refutability in the *Timaeus*, it would have reflected this complexity.
  27. A better instance of physical conjecture, and perhaps of the influence of the Timaeon doctrine, is found in the works of Kepler. The question about what spurred Kepler to move from the 1596 *Mysterium Cosmographicum*, based on the use of the Timaeon regular polyhedra to determine planetary orbits, to the 1609 *Astronomia Nova*, which adopts the ellipse and revolutionizes astronomy, is normally answered by ascribing to Kepler an obsessive concern with matching Brahe’s data. But this motive, to be credible, must have begun with a willingness to treat authoritative models in physical theory as falsifiable. Kepler’s motives in this respect become fully intelligible if this, the crux of his method, was found in his greatest authority as the Timaeon principle of partially justifiable accounts. Cf. not merely 54B1–2, but the pervasive insertions of it: *Timaeus* 28B4–C1, 29C4–D3, 29D2, 30B7, 48D–E, 53D5, 55D5, 56A1, 56B4, 68B7, 68D2, 72D7–8.
  28. The serious questions here concern the relation between Socratic elenchus and the elenchus mentioned at *Timaeus* 54B1–2, which we might term Timaeon elenchus. The consistency of a set of beliefs (or a single belief) is established by Socratic elenchus; the method is purely rational, but inductive appeals are often an intrinsic part of this (including the method of counterexample). Timaeon elenchus establishes the ‘probability’ or ‘likelihood’ (adequacy?) of a general theory. The different uses of *eikos* in *Timaeus* need a careful examination. F. M. Cornford’s criticisms of A. E. Taylor’s views about this are as exaggerated as Taylor’s own claims. Cf. *Plato’s Cosmology* (New York, 1937), 30–31, with A. E. Taylor, *A Commentary of Plato’s Timaeus* (Oxford, 1928). Cf. Vlastos, 93. Plotinus, of course, is not thematically concerned with either type of elenchus.

# THE PRACTICE OF PLOTINIAN PHYSICS

Jonathan Scott Lee

The casual reader of the *Enneads* cannot help but be struck by a paradox in Plotinus' treatment of the sensible world. On the one hand, he has a great deal to say both about the beauty and the positive moral status of this world (particularly in his replies to the Gnostics in II.9 and III.2 & 3)<sup>1</sup> and about the moral and philosophical danger that attachment to this world poses for the soul (most notably in I.8). On the other hand, Plotinus offers rather little in the way of an account of the nature of the sensible world, and much of what he does provide concerns its metaphysical analysis as an image of the intelligible world of forms (*eidē*); for example, the treatise on the categories of the sensible world (VI.3) must be read in this light. Even in *Enneads* II and III, which Porphyry explicitly describe as concerned with physics and other subjects relating to the physical universe,<sup>2</sup> there are very few passages in which Plotinus explicitly deals with what might be called physical analysis of this universe or in which he offers any sort of detailed description of things or events in the sensible world. That this marks a striking departure from the concerns of Plato, Aristotle, and the early Stoa has often been noted,<sup>3</sup> but the deeper issue of determining the precise status of physics in Plotinus' conception of theoretical inquiry has received rather little attention.<sup>4</sup> The guiding assumption of the commentators seems to have been that the issues of genuine philosophical interest in Plotinus in particular and in Neoplatonism in general are largely metaphysical, ethical, psychological and theological.

In the following pages, my aim is to show that Plotinus does in fact have something of philosophical interest to say about the status of physics and about the actual practice of the physicist; to this end, I am perhaps more interested in raising issues and breaking new ground than I am in resolving the difficulties raised. In section 1, I argue for the legitimacy (on Plotinus' own view) of considering physics as a discipline relatively independent from metaphysics (understood in terms of Platonic dialectic). In sections 2 and 3, I consider Plotinus' actual practice of physics in two

treatises of the second *Ennead* (II.7 and II.1), focusing particular attention on contrasting ways in which he treats the relation between physical investigation and metaphysical analysis. Finally, in section 4, I summarize the tentative results of my inquiry.

## 1. Physics and Dialectic

Plotinus' most explicit statement as to the character of natural philosophy in general is found at the beginning of the last chapter of his short treatise, 'On Dialectic' (I.3), where he briefly describes the relation of dialectic to natural philosophy: "So dialectic is the valuable part [of philosophy]. Philosophy has other parts; it also surveys the nature of the physical world with assistance from dialectic, as the other skills use arithmetic to help them; though natural philosophy stands closer to dialectic in its borrowing..." (I.3.6, 1-5). Rather than clarifying the nature of physics in itself, this statement maps the territory in which some such clarification must be sought: To understand the proper role of physics is to understand its relation to and specific difference from dialectic. Plotinus maintains that physics borrows from dialectic and is assisted by dialectic, but there are a number of ways in which such a relation might be construed. In describing physics' relation to dialectic as like the relation of certain other skills to arithmetic, Plotinus is apparently alluding to Plato's claim at *Republic* 522c1-9 that every sort of skill, understanding, and knowledge presupposes number and calculation. However, this reference back to Plato does little more than complicate the issue for Plotinus, since the *Republic* passage is most naturally taken to mean that all skills use mathematics as some sort of tool, while Plotinus has already denied (at I.3.5, 8-13) that dialectic is to be thought of as a tool (*organon*) for the use of the philosopher.

If dialectic cannot be taken to be a tool for the physicist (in roughly the way Aristotelian logic serves as a tool for the Aristotelian physicist), then it would seem that the relation between the two disciplines must be more intimate; indeed, it would seem that physics must borrow at least some of its content from dialectic, and this may be Plotinus' point when he remarks that physics "stands closer to dialectic in its borrowing" than do the other skills to arithmetic. At a rather schematic level of analysis, there are at least two ways in which it could be argued that Plotinian physics actually borrows all of its content from dialectic. (a) Given Plotinus' commitment to Platonism and to the fundamental Platonic claim that the

intelligible forms are the true causes of the sensible world,' a Plotinian could maintain that the complete account of the sensible world—and thus all of physics—is simply implicit in the results of dialectic. From this perspective, physics would tell us nothing which dialectic (understood in terms of the method of collection and division: see I.3.4 & 5) does not reveal, and reveal in a more systematic (because methodologically rigorous) way. (b) Given Plotinus' routine acceptance of the *Timaeus* and, in particular, its doctrine that the physical universe exists as an animal endowed with soul, a Plotinian could maintain that all of physics—as an account of the nature and action of the world's body—is implicit in the psychology of the world-soul. On such an analysis, to understand the sensible world would be simply to understand the world-soul, and this latter understanding would directly involve in turn the dialectical understanding of the intelligible world, thus collapsing (b) into an elaborated form of (a). On either interpretation, it would seem that physics is reduced to a gratuitous pastime wholly dependent upon dialectic.

Nevertheless, even on interpretations such as (a) and (b) which emphasize the extreme dependence of physics on dialectic, there is room (and even a necessity) for a conception of physics as a discipline at least relatively independent from dialectic. If dialectic is to provide the basis for an explanation of the sensible world in terms of reference to the forms, there is a place for the description of the sensible world in terms other than those of dialectic; that is, physics can be construed as a discipline dedicated to (roughly) the metaphysically neutral description of things and events in the sensible world, such description then providing the data that are to be explained by dialectic. Without some such description, it does not seem that a causal explanation of the sensible world by the forms—such as that required by (a)—would even be possible. To put the same point in another way, without the results of physics, dialectic could not be shown to be the genuine explanation of reality in all its dimensions that Plotinus clearly takes it to be (see I.3.4 & 5, especially I.3.5, 5-13). Precisely similar considerations apply to (b), but here we can perhaps go a bit further and maintain not only that physics can and must exist as a discipline devoted to the metaphysically neutral description of the sensible world but that such a physics can also describe sensible things and processes without explicit reference to the soul or souls that are ultimately causally responsible for such things and processes. Again, such a psychologically neutral description would provide precisely the data which world-soul psychology (taken in conjunction with dialectic) would then explain. That Plotinus is willing to countenance this sort of

psychologically neutral physics is made clear in the final part of the treatise on the genera of being, where he insists that a study of the genera of the things that constitute the sensible world must exclude any direct reference to soul, since "the nature of the soul is in the intelligible" (see VI.3.1, 21–31).<sup>7</sup> Later in the same treatise he argues that sensible substance may be distinguished into two classes of bodies, material (*hylikōtera*) and organic (*organika*) (VI.3.9, 1–18), and that organic motion (*kinēsis empsychōn*) must be distinguished from inorganic motion (*kinēsis apsycheōn*) (I.3.26, 4–5). From this it would seem to follow that both organic and inorganic bodies and motions can be studied without reference to any sort of psychology (either of the world-soul or of any other individual soul), and this would certainly provide at least one kind of domain for physics.

Two rather different conclusions come out of the preceding considerations. First, on general philosophical grounds, it appears that Plotinus must be willing to make room for a conception of physics as a (at least relatively-speaking) metaphysically and psychologically neutral description of the things and processes of the sensible world. Second, on specific textual grounds, it appears that Plotinus does in fact grant legitimacy to a description of things and events in the sensible world conducted in isolation from any sort of psychology (and from now on in this essay, I will take 'physics' in the narrower sense of this sort of extra-psychological inquiry). There is, thus, a reasonably clear domain for physics in Plotinus' conception of intellectual inquiry as a description (lacking ultimate explanatory power) of the sensible world. What remains unclear, however, is the precise character of this sort of physical description; in particular, what still needs to be examined is the extent of the borrowing that physics does from dialectic. In order to come to a better grasp of these issues, we need to go beyond the general arguments advanced thus far and to turn to some specific examples of physical description and analysis in the *Enneads*. As Émile Bréhier has pointed out, the question of Plotinian physics is "not one of a well-defined field of investigation, but of the way in which Plotinus deals with the questions included under this head by Aristotle and the Stoics, such as the questions concerning the nature of bodies, the elements, action and passion, mixture, the celestial movements, time, and the nature of living bodies."<sup>8</sup> While we have now seen that such a field of investigation can be somewhat carefully defined, such a definition remains essentially empty in the absence of some specific examples of the actual practice of Plotinian physics.

## 2. Total Mixture

Perhaps the single most straightforward example in the *Enneads* of Plotinus' actually practicing physics comes in the short treatise, 'On Total Mixture' (II.7), in which he offers a very direct critique of an unambiguously physical doctrine integral to Stoicism. The Stoic doctrine at issue is the claim that two or more material substances or material qualities<sup>9</sup> can so totally interpenetrate one another that "any volume of the mixture, down to the smallest parts, is jointly occupied by all the components in the same proportion, each component preserving its own properties under any circumstances, irrespective of the ratio of its share in the mixture."<sup>10</sup> Such a total mixture (*krasis di' holōn*), if it were possible, would make the totality of things mixed (in Plotinus' words) "a whole of like parts" (II.7.1, 6–8). Now, whether or not total mixture in this sense is possible would seem to be a clear case of a physical issue: that is, a decision about the truth or falsity of the Stoic doctrine will entail the truth or falsity of a variety of particular descriptions of things or processes in the sensible world (descriptions, for example, of alleged cases of total mixture). Thus, Plotinus' treatment of the doctrine should shed some clear light on the procedures of Plotinian physics, particularly since his analysis is heavily indebted to the arguments of both Stoic and Peripatetic predecessors (as has been particularly well shown by Bréhier<sup>11</sup>).

Oddly enough, commentators on Plotinus are rather divided about the actual results of Plotinus' critique. Thus, A. H. Armstrong emphasizes his basic acceptance of the Stoic view,<sup>12</sup> while H. J. Blumenthal claims that II.7 amounts to a refutation "in detail" of the view.<sup>13</sup> As we shall see, both interpretations can in fact be defended—Plotinus does refute the notion that *bodies* can mix totally, while he defends the claim that *qualities* might at least often so mix<sup>14</sup>—but to understand how this can be the case, we need to turn to the actual course of his argument, noting the points at which physics appears to 'borrow' from the results of metaphysics.

After an initial chapter reviewing in fairly elaborate detail a series of Peripatetic arguments against the doctrine of total mixture and a parallel series of Stoic responses to these arguments (for a marvelous analysis of these arguments and their sources, see Bréhier's 'Notice' to II.7), Plotinus turns in chapter 2 to develop his own position on the possibility of mixture (II.7.2, 4–6). He begins with the empirical example of water soaking through a piece of papyrus and asks, "how can we deny that the whole body of the water goes right through the papyrus?" (II.7.2, 8–9), going on to insist that this example seems to dictate the actual occurrence of total

mixture: "For, the whole papyrus is wet and its matter is nowhere destitute of the quality [of wetness]. But if the matter is everywhere accompanied by the quality of wetness, the water is everywhere in the papyrus" (II.7.2, 13–15). However, this apparent vindication of the Stoic doctrine is immediately tempered by a dose of Plotinus' own version of Platonism, when he suggests that "perhaps it is not the water [that is everywhere in the papyrus] but the quality [*poiotēs*] of the water" (II.7.2, 15). The Platonic roots of such a claim are to be found at *Theaetetus* 182a8–b2, where Plato introduces the term 'quality' (*poiotēs*) as denoting sensible qualities such as hot or white (as opposed to hotness or whiteness) and at *Timaeus* 49d3–e7 & 51b4–6, where Plato insists that the elements such as water are "suches" rather than "thises" and, thus, that water is simply a region of the receptacle that has been moistened. What Plotinus is doing at line 15 is to introduce this Platonic analysis of sensible things as qualities into his discussion, thus shifting the focus of the doctrine of total mixture away from Stoic materialism. (For a clear statement of Plotinus' acceptance of this Platonic doctrine, see II.6.1, 44–49, as well as VI.3.8, 9–27, to be discussed below.)

That this is the import of line 15 is made clear in lines 16–20, where Plotinus sketches a materialistic response to the Platonic reduction of sensible things to qualities, a response which hinges on the equation of size, mass, and matter. This response (which itself is anti-Stoic) involves the claim that, because the papyrus is enlarged by the presence of water in it, it has taken on additional mass, which entails that "the matter of the water and the matter of the papyrus must be in two different places" (II.7.2, 19–20) and that this is not an example of total mixture after all. This materialistic view, in attributing mass to matter, is of course far-removed from the Plotinian doctrine of the incorporeality of matter (for which see, in particular, II.5.5, 3–7, 20–24 & 34–36, and III.6.7, particularly in the light of Plotinus' analysis of corporeality in chapter 3 of 'On Total Mixture'), a doctrine which will be affirmed in lines 29–32, but Plotinus chooses here to emphasize that the core of the objection has some merit. In lines 20–26 (which in large part repeats the Peripatetic argument of II.7.1, 38–48), he argues in effect that size is a special sort of quality (and, in VI.3.11–15, 23, he will defend the claim that quantity is a genus of sensible things which is distinct from quality): In the case of qualities other than size (e.g. colors), when two or more qualities are mixed together, each of the qualities loses its purity as the result of its mixture (so that yellow is no longer itself when it is mixed with blue to form green); in contrast, the mixing of one size with another does not result in the

disappearance of size. It is this apparent truth that lies behind the materialist's singling out size as, in effect, constituting the matter of sensible things.

Plotinus does not go beyond this to refute the position of lines 16–20. Instead, he turns to another anti-Stoic, Peripatetic argument (first sketched at II.7.1, 8–15 & 31–32) to the effect that total mixture would require that the bodies which are completely interpenetrated in the mixture be actually divided into an infinite number of parts which is absurd (II.7.2, 26–27). However, Plotinus himself uses precisely the same argument in the very early treatise, 'On the Immortality of the Soul,' in order to show that the soul—because it is present in every part of the body and is, thus, totally mixed with the body—cannot itself be a body but must be incorporeal (IV.7.8, 7–22).<sup>10</sup> In the context of II.7, this earlier argument is implicitly recalled in order to move from the empirical fact that the papyrus is completely soaked with water (understood Platonically as wetness) to the new claim that qualities, such as wetness, can "go through bodies without cutting them" because these qualities are incorporeal (II.7.2, 27–29). In other words, Plotinus uses the empirically confirmed fact of total mixture in the case of the wet papyrus, a fact understood in terms of the Platonic analysis of sensible things as qualities, in order to show that sensible qualities are incorporeal (just as he had used in IV.7 the fact of soul's omnipresence in or total mixture with the body in order to show that the soul is incorporeal). It follows that he is willing to allow the possibility of the total mixture of *qualities*, while he denies the possibility of the total mixture of *bodies*.

The remainder of chapter 2 of II.7 provides a general analysis of the constraints on total mixture. It might seem that, given the incorporeality both of matter and now of sensible qualities, there would be no limits to the possibility of total mixture (II.7.2, 29–32). Nevertheless, Plotinus suggests (and here again it seems that the evidence for his claim is largely empirical, although no examples are cited) that certain qualities at least cannot completely interpenetrate solids (*ta stereā*), because solids "have qualities of such a kind as to prevent their penetration" (II.7.2, 33–34). He elaborates this claim by maintaining that the failure of solids to enter into total mixture may stem either from their being constituted by a large number of qualities—density (*pyknotēs*) being understood as a multiplicity of qualities—or from solids possessing the particular quality of density (II.7.2, 34–38). In either case, it follows that "it is not in so far as they are qualities that they will blend but in so far as they are qualities of a certain kind" (II.7.2, 38–39). The final, very difficult lines of the chapter suggest

that qualities essentially connected with size may not admit of total mixture (thereby picking up the thought of lines 20–26?), but it is not at all clear just how this suggestion may be developed (II.7.2, 39–42).

With the end of chapter 2, the *physics* of II.7 comes to an end. We are now in a position to try to say something about the actual practice of physics that is exemplified in the treatise we have been considering. The first thing to be noted is that Plotinus does in fact offer (at a general level, to be sure) a description of the sensible world when he claims that total mixture is possible in certain situations. The further claim that these situations depend upon the nature of the sensible qualities to be mixed is, again, a claim that ultimately will shape detailed descriptions of the sensible world. To this extent, then, the treatise does conform to the conception of physics as a more-or-less metaphysically neutral description of the sensible world defended in section 1 of this essay. The second thing to be noted is that these general physical propositions descriptive of the physical world are defended by an argument which essentially involves the metaphysical claim that sensible things are to be analyzed as qualities (or sets of qualities). That this claim is simply borrowed from Plato makes it no less a result of dialectic (in the broad sense of dialectic as the discipline that develops the most general accounts of reality: see I.3.4 & 5, especially I.3.4, 1–9), and thus what we have here is a fairly clear case of a physical assertion which ultimately rests on an argument which makes essential use of a metaphysical assertion. This would appear to be a striking example of one way in which physics can ‘borrow’ from dialectic and borrow from dialectic in such a close way that the argument for the physical claim presupposes the truth of certain dialectical results. In this sense dialectic would serve Plotinian physics not as a tool (Cf. I.3.5, 8–13) but as a source of premises essential to the defense of physical claims. Moreover, the relative independence of physics from dialectic would be preserved in the distinction between the propositions of physics (which issue directly in statements descriptive of the sensible world) and the propositions of dialectic (which lead to statements descriptive of the sensible world only in conjunction with other, apparently non-dialectical propositions, such as descriptions of empirical fact).

The dialectical—or metaphysical—step in Plotinus’ analysis of total mixture in chapter 2 of II.7 is elaborated in the brief third chapter of the treatise, which offers by way of an appendix to the argument of chapters 1 and 2 a metaphysical analysis of ‘corporeity’ (*sāmatorēs*). Corporeity is simply “a certain form [*eidōs*] and a certain *logos* which enters matter and makes it body. If, then, this is what body is, that which is composed of all

the qualities with matter, this is what corporeity would be” (II.7.3, 3–5). In other words, the term corporeity denotes the particular group of qualities that makes a body a body, a group which is itself an incorporeal thing (or quality) made up of incorporeal qualities (hence, Plotinus’ insistence that corporeity is a *logos*). Implicit in this analysis of corporeity is Plotinus’ basic metaphysical claim about the things that make up the sensible world, namely that they are nothing more than clusters of qualities in matter (matter understood here as the formless receptacle of the *Timaeus*).<sup>10</sup> The clearest expression of this view comes in the third treatise on the genera of Being (VI.3), where Plotinus writes:

But then sensible substance will be a certain conglomeration [*symphorēsis*] of qualities [*poiotēs*] and matter, and all these qualities compounded together in one matter will be substance, while each taken separately will be either a quality [*poion*] or a quantum or many qualities. (VI.3.8, 19–23)

A few lines later Plotinus describes the “so-called substance” of each sensible thing as a mixture (*migma*) of these qualities (lines 25–27), and—as J. M. Rist has pointed out—this term calls to mind the Stoic notion of total mixture (*krasis*). Rist maintains that Plotinus probably uses ‘mixture’ here “because ‘collection’ might be held to imply that the particulars were in some way physically divisible or reducible to their qualitative parts—which would be absurd.”<sup>11</sup> While this is a reasonable interpretation, what is most striking about this passage in the context of our discussion is that Plotinus uses a notion of mixture both in physical description of the sensible world (where the term used is ‘*krasis*’) and in metaphysical analysis of the substances that make up the sensible world (where the term used is ‘*migma*’).<sup>12</sup> Moreover, in both cases the mixture at issue is a mixture of sensible qualities, which qualities are inherently incorporeal. What we see here, then, is that Plotinian physics shares with Plotinian metaphysical analysis of the sensible world a key concept—that of mixture—and it is by no means inconceivable that dialectic has borrowed the concept from Stoic physics. Later in the treatise on the genera of the sensible world, Plotinus again has recourse to the concept of mixture in his discussion of integration and disintegration as species of motion in chapter 25. Here he refers to the coming into being of new unities in the sensible world by means of *synknesis*, *mixis*, and *krasis* at lines 9–12, and later he sketches a rather Anaxagorean analysis of sensible alteration in general in terms of integration and disintegration (understood along the suggested lines of mixture)<sup>13</sup> and illustrates this with the example of the mixing (*mignuein*) of wine and water to produce something different

from either of its constituents (VI.3.25, 24–29). What makes this sort of analysis dialectical (as opposed to physical) would seem to be the level of its generality more than anything else. An account of sensible change in general as a mixing and remixing of sensible qualities is compatible with almost any more particular description of the actual sorts of sensible changes (or quality mixtures) which are found to occur; in contrast, the Plotinian claim that total mixture is possible in the case of certain mixtures of qualities and impossible in the case of other mixtures of qualities (once this claim is made suitably specific, along the lines sketched in II.7.2.29–42) clearly dictates precise features of detailed descriptions of sensible things and processes.

Thus, our discussion of 'On Total Mixture' yields two results of importance to the understanding of Plotinian physics. First, while physics may issue in descriptions of the sensible world which are relatively independent of the ultimate metaphysical explanations of this world, the practice of physics may legitimately borrow premises from dialectic in order to justify or even to derive its descriptions. While Plotinus' practice in II.7 in no way suggests that such borrowing would be a necessary feature of physical argument, the alleged independence of physics from dialectic remains rather unclear. Second, the still puzzling difference between dialectic and physics seems (at least in the case of the contrasting uses of the concept of mixture) to come down ultimately to a difference in the degree of generality or universality of the claims of the respective disciplines, with dialectic offering exceedingly general characterizations of conceptual and ontological relations which find concrete and more specific exemplification in the propositions of physics. This analysis finds some confirmation in the treatise, 'On Dialectic,' where after making the rough distinction between dialectic and physics which we discussed in section 1 of this essay, Plotinus goes on to distinguish dialectic from moral philosophy, as well as to distinguish practical wisdom from the other virtues, primarily in terms of degree of generality, emphasizing for example that practical wisdom (*phronēsis*) is more concerned with the universal than are the other virtues (I.3.6, 5–14). The immediate proximity of this analysis to the distinction between dialectic and physics at least suggests that degree of generality may be relevant to the earlier distinction as well. With these issues in mind, let us turn to another example of Plotinian physics.

### 3. The Composition of the Stars

The treatise, 'On Heaven' (II.1), written apparently in the same period as 'On Total Mixture' (in Porphyry's chronological ordering of Plotinus' treatises), is devoted to a defense of the Platonic doctrine of the incorruptibility of the heavens against the objections of Stoics and Stoicizing Platonists. As Bréhier has shown,<sup>2</sup> the treatise falls into two fairly distinct parts: Chapters 1–5 defend the general position, insisting that the heaven as a whole and all its parts are equally incorruptible, everlasting and immutable, and attempt to show how such a view is compatible both with much of Aristotelian doctrine and with the *Timaeus*, as well as with certain tenets of common sense; chapters 6–8 strengthen this position by developing an interpretation of the *Timaeus* which shows that the heavenly bodies are not made up of any mixture of the terrestrial (or sublunary) elements, but are composed of a pure variety of fire, thus undermining any argument for the corruptibility of the heavens by appeal to the instability of the elements (and also undermining the curious Stoic notion that the heavenly bodies need nourishment). This discussion of the composition of the stars is forced upon Plotinus by his earlier denial of Aristotle's doctrine of the quintessence (II.1.2, 12–16). It is with the second part of the treatise that we shall be concerned here, because it is in chapters 6 and 7 particularly that an unambiguously physical doctrine is defended. The claim that the heavenly bodies are made of a pure variety of fire is surely a clear case of a description of the sensible world, and it is thus a particularly striking feature of Plotinus' argument for this claim that it proceeds in large part by way of textual exegesis, with the *Timaeus* as the text at issue.

Two passages from the *Timaeus* set the argument in motion in chapter 6: At 31b4–8 Plato maintains that the universe must be made up of fire (on the grounds that it is a visible thing, and nothing is visible without fire) and of earth (on the grounds that it is a solid thing, and nothing is solid without earth); at 40a2–3 Plato suggests that the bodies of the gods—i.e. the stars—must be made primarily of fire, given their brilliant sensible appearance (see II.1.6, 2–12). The apparently clear view developed here is, however, complicated by a third passage—*Timaeus* 31b8–32c4—where Plato, arguing that two distinct things can only be unified by a third, claims that air and water provide the necessary intermediates for the proportionate uniting of fire and earth. This would appear to require that the heavenly bodies—like all other bodies in the sensible world—be made of some ratio of all four elements.

Now, while such a view seems to be perfectly consistent with the passages from the *Timaeus* at issue here, Plotinus is uneasy with it, in part for apparently empirical reasons—it certainly appears that water and earth can be mixed together, for example, without the presence of fire or air (II.1.6, 14–17)—and in part because it seems to compromise the very identity of the elements. Indeed, the remaining portion of chapter 6 brings up a series of arguments—arguments of a curiously hybrid character, making conceptual points on the basis of empirical observation—each of which is meant to cast doubt on the (again Anaxagorean) claim that “no element would ever have its own essential nature by itself, but all are mixed and take their names from the dominant element in each” (II.1.6, 22–24).<sup>21</sup> A representative example of these arguments is that concerned with the essential presence of water in earth:

They say that earth cannot have concrete existence without moisture; the moisture of water is earth's adhesive. But even if we grant that this is so, it is absurd to say that each element is a separate something and not give it any concrete existence but only an existence along with the others, without anything being separate. How could there be a nature and substantial reality of earth if there is no particle of earth which is earth unless water is present in it to stick it together? What could the water stick if there was no bulk of earth at all which it could join to another contiguous particle? And if there is any bulk of absolute earth at all, then earth can exist by nature without water; and if it is not so, there will be nothing to be stuck together by the water. (II.1.6, 24–35)

We see Plotinus here moving rapidly from what seems to be a conceptual point about the need for the terms of a relation to have some existence separate from that relation to a series of rather oddly materialistic claims about the need for ‘natures’ and ‘substantial realities’ (the Aristotelian term *to ti ên einai* is used at lines 29–30) to be exemplified in a relatively pure form in the sensible world. Curiously enough, both the conceptual point and these materialistic claims are at odds with Plotinus’ assertions in the treatise ‘Against the Gnostics,’ that the coming-to-be of the sensible world does not proceed one element at a time (beginning with fire, according to certain Gnostics) and that this coming-to-be follows a sort of mathematical blueprint or outline which already contains all the elements in their mutual relations (II.9.12, 12–23 & II.9.17, 4–10). Thus, it comes as no surprise that Plotinus eventually grants the claim that at least many sensible things (those “on earth”) are composed of all the elements (II.1.6, 54–60); indeed, in the treatise on the genera of Being, he even grants the

truth of the *Epinomis* principle of naming by predominance (VI.3.9, 15–18). What he is not willing to grant is that these claims hold true of the celestial bodies, and his apparent argument for this restriction is simply that “to lift up earth into heaven is against nature and opposed to her laws” (II.1.6, 56–57).

In chapter 7, Plotinus’ doubts about the omni-elemental composition of sensible things find a deeper analysis in his reinterpretation of *Timaeus* 31b4–8, where Plato appears to maintain that the stars must be made up of both fire and earth. Here he draws a distinction between the nature or substance of an element and certain qualities that belong to that element, suggesting that it is these latter qualities that may mix together to make sensible things appear to be constituted by all the elements. At lines 10–19 he writes:

Earth is mingled with the upper fire, not in the constitution of the stars but because, since they are both in the universal order, fire gains something from earth as earth does from fire and each element from each of the others; not in the sense that the element which gains something is composed of both, itself and that of which it has a share; but, through the community of the universe, while remaining itself it takes, not the actual other element but something which belongs to it, not air, for instance, but the yielding softness of air, and earth the brightness of fire: the mixture gives all qualities and consequently produces the compound thing, not supplying earth only and the nature of fire but this solidity and density of earth.

Given this distinction, Plotinus seems to believe that he can maintain that the pure fire of the stars need not be mixed with earth itself in order to share in earth’s quality of solidity, and this neatly solves the problem of *Timaeus* 31b4–8. Thus, he concludes (and the rest of the treatise pursues the implications of this conclusion) that the stars are composed of this pure variety of fire, without any admixture of other elements (or even of other species of fire).<sup>22</sup>

I have quoted extensively from Plotinus’ argument in chapter 7 so that the striking language of the passage may be apparent. From the mingling (*memichthai*) of earth and fire Plotinus moves on to the mixture (*mixis*) which bestows all qualities, and the link between these two sorts of mixing appears to be the community (*koinōnia*) of the universe as an ordered system (*kosmos*). The language of Stoicism is pervasive here in the reference to mixture and in the suggestion of the doctrine of cosmic sympathy; at the same time, the language of Plotinus’ analysis of sensible substances as conglomerations or mixtures of sensible qualities is recalled.

Here, however, and in contrast to other discussions, Plotinus suggests that there is a legitimate distinction to be made between sensible elements and their qualities, which in turn suggests that the elements—which surely are examples of sensible substances—cannot simply be groupings of sensible qualities. The attempt to make a sharp distinction between, for example, earth and its solidity threatens the analysis of cases of total mixture in II.7 (where, it will be remembered, Plotinus identifies water with its wetness: see II.7.2, 15). The key to the resolution of this problem would seem to lie in Plotinus' endorsement of the Aristotelian distinction between qualities and essence in his account of the sensible world (VI.3.16, 1–5) and in his tendency to conflate the notion of sensible essence with the notion of the intelligible *logos* which comes to be present in matter (for a striking example of this, see II.6.2, 6–34). This would allow him to maintain that the stars are essentially composed solely of fire—implicitly making reference to the *logos* of fire manifested in the bodies of the stars—while granting that they possess incidentally such earthy qualities as solidity—here referring to the mixture of sensible qualities which is, strictly speaking, the sensible substance. Such an analysis would leave Plotinus denying the Aristotelian identity of substance and essence (at least for sensible things), but this is not at all unreasonable for a serious Platonist who would maintain that the real essences of sensible things are to be found outside the sensible world in the intelligible world of forms.\*

Looking back over the argument of II.1.6 & 7, we can see that Plotinus has once again had recourse to the dialectical analysis of the sensible world in order to establish a proposition descriptive of that world, in this case the proposition that the stars' bodies are composed solely of a pure species of fire and not of a mixture of all the elements. The dialectical results employed here are in fact two: First, he endorses the analysis of sensible substances as mixtures of qualities (which analysis had paved the way for his views on the possibility of total mixture); second, he introduces the distinction between the essence and the (nonessential, incidental) qualities of sensible substances. Both of these points are clearly dialectical in their origins—having to do with those most general characterizations of reality which are the special province of dialectic, as described at I.3.4, 1–9—and in themselves seem compatible with a variety of (physical) descriptions of the sensible world. However, in the course of his exegesis of *Timaeus* 31b4–8, Plotinus manages to use these dialectical results to lend support for a claim about the composition of the stars which clearly is a matter of physical description. It should be noted that chapters 6 and 7 of 'On Heaven' in no way constitute a proof of or

even an argument for Plotinus' physical description; at best, the chapters shows that such a description is both coherent and compatible with Plato's text. This is in clear contrast to Plotinus' procedure in 'On Total Mixture,' where the physical claims about the possibility of total mixture were quite clearly defended by an argument making explicit use of dialectical results. Our study of II.1 also suggests that we were on the right track at the end of section 2 of this essay in suggesting that dialectic is to be distinguished from physics (at least partially) by reference to the greater generality or universality of its claims. Here, we see that dialectic yields the distinction between essence and qualities, while allowing an elaboration of sensible substance in terms of mixtures of qualities, but it is left for physics to offer the highly specific claim that the bodies of the stars are composed of fire alone.

#### 4. Tentative Conclusions

In the preceding pages I have attempted to uncover the nature of Plotinian physics in part by considering the implications of Plotinus' Neoplatonism in general (in section 1) and in larger part by considering two specific cases of his actual practice of developing and defending what are clearly propositions descriptive of the physical world (in sections 2 and 3). Several things have emerged from the discussion. (1) There does seem to be room within Plotinus' conception of philosophy for a (perhaps relatively unimportant) discipline of describing the sensible world, a discipline which would in effect find its ultimate justification in providing the data to be explained metaphysically by appeal to the intelligible world of forms. (2) Plotinus at times develops the claims of such a descriptive physics by appeal to empirical observation: In 'On Total Mixture,' the observation of water soaking through papyrus was suggested by the Stoic doctrine under review in the treatise, but what Plotinus emphasizes is the apparent empirical support for the doctrine. (3) Plotinus at times finds his physical doctrine in the texts of earlier thinkers, most notably in the *Timaeus*, and even when he cannot quite find the doctrine he wants (as in 'On Heaven') he is concerned to show how the doctrine is at least consistent with the claims of Plato. (4) In the arguments in support of his physical claims, Plotinus is willing to countenance the borrowing of indispensable premises from dialectic: In II.7, for example, the defense of the possibility of total mixture is dependent upon the metaphysical analysis of sensible things as collections—in fact, mixtures—of sensible qualities.

Here we find that an empirically plausible view is made compelling by means of metaphysical analysis. (5) Plotinus' attempts to derive physical doctrines from other texts—what might be called *exegetical physics*—at times make use of distinctions or analyses which are properly dialectical in their origins: In II.1 we find that he makes use of both the mixture analysis of sensible substance and the Aristotelian distinction between essence and quality not so as to prove that the stars are composed solely of fire but to show how such a physical claim could be consistent with Plato's text in the *Timaeus*.

Each of these five points helps to clarify Plotinus' remarks in 'On Dialectic' about the relation between dialectic and natural philosophy, and I believe that our discussion at least allows us to rule out one plausible analysis of the practice of Plotinian physics. Bréhier, for one, argues that the method of Plotinus' physics is "always the same," something that we have seen is quite clearly not the case, based on our study of II.7 and II.1. He goes on to explain the character of this method:

It is a method of conversion which consists in excluding from matter and bodies all positive reality that one might be tempted to attribute to them, and in ascribing it to an action from above....[Physical explanation] consists in first stripping matter and then bodies of all positive realities which experience reveals to us as existing in them, inasmuch as, at each level, these realities are traces of the Soul. One will be a good natural philosopher to the extent that one knows how to convert the sensible world into spirit....<sup>7</sup>

While it is clear that Plotinus will insist that appeals to soul and the forms are necessary for the ultimate explanation of things and events in the sensible world, our study of the actual practice of his physics shows that there is a properly physical describing of the sensible world which can proceed without any overt such appeals to soul or the intelligible. Indeed, the metaphysical claims that play such an important role in the treatises we have been considering concern precisely the analysis of sensible substances taken in themselves (and not in their relation to the intelligible). Moreover, it is simply not the case that Plotinus attempts to eliminate empirical observation and its results from his physical descriptions of the sensible world, as Bréhier suggests. He uses dialectic to reinterpret or to reanalyze the results of observation, but he does not substitute metaphysical analysis for empirical description.

Nevertheless, it does appear that Plotinus' willingness to allow physics to borrow from dialectic raises some problems for the interpretation of Plotinian physics that may prove quite difficult to resolve.

In the passage quoted earlier from chapter 7 of 'On Heaven,' we saw that Plotinus maintains that each of the elements possesses the qualities of the other elements, and he attributes this to the community (*koinōnia*) of the universe, which is in turn apparently described as a mixture (*mixis*) (lines 10–19). One plausible interpretation of this admittedly obscure passage would be that the community of the universe is in fact the total mixture of all things in all things; corresponding to the Stoic doctrine of cosmic sympathy that Plotinus attributes to the fact that the universe is a single living organism,<sup>8</sup> this theory of community would provide an analysis of the unity of the world's body in terms of the omnipresence of all sensible things in all sensible things. The principle that 'all things are in all things' has a long history, beginning as early as Anaxagoras<sup>9</sup> and continuing through the later Neoplatonists (where it provides among other things a crucial premise in the analysis of the functioning of magic).<sup>10</sup> What is striking here is that the logic of Plotinus' position in II.1.7 appears to force him into accepting this principle at a very general level as describing the relation of the elements to one another,<sup>11</sup> and there is no clear reason why the principle could not and should not be extended to cover the relation of all sensible substances to one another. However, if the principle is so extended, it appears to run into conflict with Plotinus' treatment of total mixture in II.7. As we saw in section 2, Plotinus argues at some length that total mixture (of which 'all things are in all things' would be the extreme case) is possible in certain mixtures of sensible qualities; however, he also clearly indicates that certain qualities (apparently constituting density) may not allow of such total mixture. The suggested reading of II.1.7 dictates that total mixture must, on the contrary, be characteristic of the entire sensible world, and this is difficult to reconcile with Plotinus' earlier willingness to grant that not all qualities completely intermix.

One way out of this puzzle would be to insist that the principle that 'all things are in all things' commits Plotinus to a general acceptance of total mixture at the level of a dialectical analysis of sensible things but not at the level of physical description. This, of course, would serve to confuse further the still problematic distinction between dialectic and physics, although perhaps the distinction could be salvaged once again by appeal to varying degrees of generality. However, such an analysis would still require the Plotinian physicist to explain how it is that not all sensible qualities appear to mix totally in the sensible world (it being understood that they are all *really* mixed totally, when considered dialectically). Part of the difficulty here is that physics and dialectic seem to be competing with one another in describing the sensible world, the greater generality of

dialectic nevertheless dictating rather specific physical claims; and it is not immediately clear how the Plotinian is to show that sensible qualities can both be and not be mixed totally at the same time.

In the final analysis, the difficulties and obscurities of Plotinian physics may simply be the inevitable consequences of a general philosophical *Weltanschauung* which stresses the comparative unimportance and even moral danger of preoccupation with the sensible world. Indeed, in his dialectical examination of the genera of the sensible world (VI.3), Plotinus often emphasizes the possibility that there are competing views of more-or-less equal plausibility, although he usually does attempt to resolve the lingering uncertainty by arguing for one analysis rather than for another. At the end of the treatise, arguing about the role of stability (*stasis*) as a possible genus of sensible things, Plotinus finally betrays a certain impatience with his discussion: "But about these questions let it be decided in whatever way seems best to each individual" (VI.3.27, 44). If the dialectical analysis of the sensible world's genera is thus relatively unimportant to Plotinus, it would come as no surprise to see him dismiss worries about the proper (physical) description of the sensible world. In his discussion of matter's impassibility in III.6, he in fact comes very close to this, suggesting that the presence of form in matter may be described almost any way one likes—since matter (i.e. Plato's receptacle) is utterly without form—and quoting Democritus' strikingly relativistic saying, "Color by convention and other things by convention,"<sup>1</sup> as illustrative of this point (III.6.12, 19–24). What these passages suggest is that it may be asking too much of Plotinus to expect a firm, clear, and consistent account of the sensible world to be found in the *Enneads*. Nevertheless, I have tried to show that there a number of hints in Plotinus' own analyses of physical issues as to how the project of the physical description of the sensible world might be carried out along Plotinian lines. That there remain unresolved problems in working out the details of the Plotinian conception of physics as a branch of philosophy distinct from dialectic will not, I hope, discourage further examination of these issues.

#### NOTES

1. All references to Plotinus are to the critical edition of Paul Henry and Hans-Rudolf Schwyzler (Paris and Brussels: Desclée de Brouwer, 1951–1973). All translations from *Enneads* I–III are essentially those of A. H. Armstrong in *Plotinus*. (Cambridge, MA: Harvard University Press, 1966–1988). All other translations are those of the author.

2. For Porphyry's descriptions of these treatises, see his *Vita Plotini* 24, 37–39, 59–60, & 25, 1–11.
3. For a recent example, see John P. Anton, "Plotinus' Approach to Categorical Theory" in *The Significance of Neoplatonism*, ed. R. Baine Harris, (Norfolk, VA: International Society for Neoplatonic Studies, 1976), 89 & 94–95.
4. The major exception to this is Émile Bréhier, whose explicit treatment of Plotinian physics is discussed below.
5. On this dimension of Plotinus' Neoplatonism, see my "Omnipresence, Participation, and Eidetic Causation in Plotinus" in *The Structure of Being: A Neoplatonic Approach*, ed. R. Baine Harris, (Norfolk, VA: International Society for Neoplatonic Studies, 1982), 90–103.
6. Such a claim may be presupposed by Plotinus himself at VI.3.10, 7–20.
7. On the role of the soul in the structuring and maintenance of the sensible world, see IV.3, 9–16, III.2 & 3 & II.3, 16 & 17, as well as such curious shorter passages as II.2.1, 37–39 & II.1.3, 13–23.
8. Compare Plato's rather different emphasis at *Timaeus* 59c5–d3.
9. Compare Émile Bréhier, *The Philosophy of Plotinus*, translated by Joseph Thomas (Chicago: The University of Chicago Press, 1958), 171.
10. Bréhier, *Philosophy of Plotinus*, 175.
11. Rist points out that even as early as Zeno the doctrine is held to be true of both substances and qualities; see J. M. Rist, *Stoic Philosophy* (Cambridge: University Press, 1969), 158.
12. S. Sambursky, *Physics of the Stoics* (London: Routledge and Kegan Paul, 1959), 13.
13. See his "Notice" to II.7 in Plotin, *Ennéades*, texte établi et traduit par Émile Bréhier (Paris: Société d'édition Les Belles Lettres, 1924–1938), II:89–90[sic].
14. A. H. Armstrong, *The Architecture of the Intelligible Universe in the Philosophy of Plotinus: An Analytical and Historical Study* (Cambridge: Cambridge University Press, 1940), 37. Reprinted, Amsterdam: Adolf M. Hakkert, 1967.
15. H. J. Blumenthal, *Plotinus' Psychology: His Doctrines of the Embodied Soul* (The Hague: Martinus Nijhoff, 1971), 3 and 10.
16. Bréhier is clear about this implication of the treatise; see his "Notice" to II.7 and *Philosophy of Plotinus*, 177. This also appears to be Rist's view; see J. M. Rist, *Plotinus: The Road to Reality* (Cambridge: University Press, 1967), 173.
17. Armstrong notes that there thus appears to be some connection between the doctrine of total mixture and Plotinus' doctrine of omnipresence: see *Architecture*, 37. Compare Blumenthal's very different reading of IV.7: see *Plotinus' Psychology*, 10.
18. Plotinus' metaphysical analysis of sensible particulars has been carefully discussed by A. C. Lloyd, "Neoplatonic Logic and Aristotelian Logic," *Phronesis* I (1955–1956), 158–159; Rist, *Plotinus*, 107–108; and Kevin

- Corrigan, "The Internal Dimensions of the Sensible Object in the Thought of Plotinus and Aristotle," *Dionysius* V (1981), 98–99. All of these stress the essentially Platonic origins of this analysis.
19. Rist, *Plotinus*, 108.
  20. Sambursky points out that *krasis* refers to the mixture of liquids, while *mixis* refers to the mixture of non-liquids in Stoic texts, but I see no reason to think Plotinus' use of 'migma' in VI.3.8 is influenced by this distinction: see Sambursky, *Physics*, 12–13.
  21. The roots of this analysis of sensible change are to be found in Anaxagoras, fragment B 17.
  22. See his "Notice" to II.1, *Ennéades*, II:3–5.
  23. For Anaxagoras' version of this position, see Aristotle, *Physics* 187a23–b7.
  24. Armstrong emphasizes that this view is developed in the pseudo-Platonic *Epinomis* 981c8–982a3: see his translation, II:24, n1. It is worth noting that this view is itself again perfectly compatible with the passages from the *Timaeus* at issue here.
  25. This pure species of fire which "is other than flame and only gently warm" (Cf. *Timaeus* 58c5–7) is nevertheless a body and is not to be confused with incorporeal light: see II.1.7, 25–30.
  26. Aristotle's complex analysis of the relation between substance and essence is the central topic of *Metaphysics* Z, especially chapters 4 & 6.
  27. Bréhier, *Philosophy of Plotinus*, 175 & 178.
  28. On Plotinus' account of cosmic sympathy, see R. T. Wallis, *Neoplatonism* (London: Duckworth, 1972), 70–72.
  29. See the passage from the *Physics* (187a23–67) cited above.
  30. On the principle in general, see Wallis, *Neoplatonism*, 107 and 123–124, and Dodds' note in Proclus, *The Elements of Theology*, revised text with translation by E. R. Dodds (Oxford: Clarendon Press, 1963), 254.
  31. Dodds notes that Proclus accepts the principle at precisely this level in his *Timaeus* commentary, II.26, 23–27, 7: see *Elements*, 254.
  32. See Democritus, fragments H 9 & B 125.

## PLOTINUS AND BIOLOGY

Anthony Preus

A reader might find the subject of this essay somewhat surprising, since Plotinus is not generally credited with having contributed to biology. In fact, Plotinus says very little about what we would call the science of biology. It would have been surprising had he done so, for the earlier Neoplatonists as a group developed a philosophical position which seems in its broad outlines independent of biological investigations. The classic interpretation of Plotinus and his associates would lead us to believe that few philosophies have turned so completely away from empirical studies of nature; Plotinus especially is taken to have pursued the formal, eschewing the multiplicities of the material world. However, in this essay I argue that Plotinus did, after all, make some very important contributions to the development of later biological thought, and in particular to the development of biological concepts which broke away from the dominance of Aristotelianism. The common notion of historians of biology is that Aristotle's philosophy, augmented by the Alexandrians and Galen, reigned supreme throughout antiquity and the middle ages, and continued to dominate Renaissance and early modern biological thought. In this connection, such people as Harvey and Caisalpino come to mind. My objective in this essay is to indicate one way in which that Aristotelian synthesis was seriously modified by a philosophical position which opened the way to a quite different way of understanding the living world.

A survey of the literature on Neoplatonism supports the impression that biological concerns are not easy to tease out of their texts. Many pages have been written about the theory of the soul in Plotinus and others of his school, but until Emilsson published *Plotinus on Sense-Perception* (1988) only a few pages dealt with the physiological consequences of the embodiment of soul, and still today very few pages indeed discuss the non-psychological parts of biological theory in Plotinus.<sup>1</sup> H. J. Blumenthal explains that for Plotinus, all soul is derived from Nous (Intellect), and from the World Soul, and consequently the particulars of embodiment are not so worthy of investigation as the bare

fact of embodiment; the entelechy theory of the soul, so fruitful for Aristotle's biological investigations, is explicitly rejected.<sup>2</sup> Perhaps there exists somewhere an extensive study of Plotinus and biology, but I have found only one short essay and a part of a book chapter explicitly with any early Neoplatonist's approaches to biology as such: The article is Pierre-Maxime Schuhl, 'Plotin et la Biologie' (CNRS, 1971), 110; and it is barely half a page long. Schuhl's summary is suggestive, however; my comments owe much to his. The section in a book is Grigorios Kostaras, *Der Begriff des Lebens bei Plotin* (1969), 27–37. I found Kostaras' book only after I had completed this essay, but was pleased to find that he anticipated several of my interpretations.

There are several reasons for thinking that Plotinus *ought* to have something to say about biology. In the first place, Plotinus, like all Neoplatonists, takes Plato's *Timaeus* almost as a sacred text—and the last forty pages of that dialogue are full of suggestions for directions which could be taken in biological investigation. Those suggestions were not lost on the *middle* Platonists. Secondly, the interests and pursuits of several of the middle Platonists would lead us to expect comments on biology from the Neoplatonists as well. It is well-known that Galen thought of himself as a Platonist, and that he tried to synthesize the *Timaeus* with the Hippocratic medical tradition in the *Doctrines of Plato and Hippocrates* and elsewhere.<sup>3</sup> But it is also true that several of the essays in Plutarch's *Moralia* rely upon biological knowledge, and show an interest in the character, if not the structure or physiology, of various species of animals; such essays include 'On the Cleverness of Animals,' 'Beasts are Rational,' 'The Eating of Flesh,' and 'The Causes of Natural Phenomena,' which last also shows some interest in plants, along with much else. Another middle Platonist treatise, the *Epitome of Plato's Doctrines* attributed to Alcinous in the manuscripts and to Albinus by most modern scholars, synthesizes Platonic and Aristotelian attitudes toward biological investigation, finding particularly significant the physiological implications of the embodiment of the soul. Chapters 17–22 explicitly summarize the later pages of the *Timaeus*. Another middle Platonist who interested himself in biomedical matters was Apuleius; probably some degree of interest was rather widespread in that period among those who considered themselves Platonists.<sup>4</sup>

Nevertheless none of the earlier Neoplatonists (Plotinus, Proclus, Porphyry, Iamblichus) seems to have paid significant attention to the later pages of the *Timaeus*. I have found nothing in Plotinus which refers unambiguously to those pages, and that impression is supported by

Charrie's reading (*op. cit.*) The great commentary by Proclus stops well before the biological material begins, and my survey of the other early Neoplatonists has turned up only vague secondhand echoes of Plato's biomedical interests. Of course *later* Neoplatonists knew the entire *Timaeus* quite well, and some of them were guided in their reading by Galen and other middle Platonists.

P.-M. Schuhl calls attention to several more sophisticated reasons for thinking that Plotinus and the Neoplatonists should be interested in biology. His brief summary claims that no one has studied the specifically biological aspects of the thought of Plotinus, but that several passages of the *Enneads* touch upon biological issues of interest even today. He calls attention to Plotinus' rejection of mechanistic explanations (III.8), although there is much more to be said about that tractate; he notices also some comments in passing (II.4.8 on specific size, IV.4.7 on the continuity of biological movement) which he thinks bring Plotinus close to the biologically motivated thought of Andre Meyer and Henri Bergson; finally, he notes the chapter (IV.9.6) in which Plotinus most clearly tries to explain how *logoi* are present in the seed in sexual generation. The references to Meyer and Bergson might seem hyperbolic, but they are not; Bergson lectured in 1897–1898 on *Enneads* IV, which includes the passage Schuhl compares with Bergson's thought.<sup>5</sup>

### 1. *Enneads* II.4.8.

Looking more closely at the passages cited by Schuhl, we find that one of them states the notoriously Neoplatonistic doctrine of the negativity of matter:

All that ever appears upon matter is brought in by the *eidos* [form]: the *eidos* alone possesses: to it belongs the magnitude and all else that goes with the *logos* or follows upon it. Quantity is given with the *eidos* in all the particular genera—man, bird, and particular kind of bird. The imaging of quantity upon matter by an outside power is not more surprising than the imaging of quality; quality is no doubt a *logos*, but quantity also is, being measure and number.<sup>6</sup>

If explanation is so completely dependent upon form, we may readily suppose that Plotinus does not have available the sorts of explanations of defects, errors and oddities to which Aristotle has recourse; even Plato

appeals to irregularities of matter more readily than can Plotinus. For Aristotle, inadequacies of material entities may be ascribed to the failure of form to master the matter; for Plotinus there is ultimately nothing to be mastered, so must not the inadequacies be ascribed to the form or to the *logos* itself? Probably there is a Plotinian answer, but it must be different from the Aristotelian. Another point worth noticing in this passage is that Plotinus does not distinguish between '*eidos*' and '*genos*' in such a way that we would be tempted to translate those words into the modern concepts of 'species' and 'genus'; in this passage *eidos* and *logos* are adventitious forms, while the word '*genos*' refers indiscriminately to two classificatory levels of animal. This is not actually as much a break with the Aristotelian tradition as one might think, since it is not correct to translate even Aristotle's uses of the words '*eidos*' and '*genos*' as 'species' and 'genus.'

## 2. *Enneads* V.9.6

Plotinus comments several times on how form is present in sexual generation. It seems to me that he was worried about how his general philosophical position could handle the ontological problems involved in sexual generation; at least he suggests ways in which defects and errors may occur, even if he does not answer questions we may have about the ontological status of new members of a species. A positive theory of the transmission of form might be derived from V.9.6, where the containment of powers in seeds (*spermata*) is used as an image to explain how the mind includes the contents of intellection:

The entire mind includes as a genus includes species and a whole includes parts. The powers of seeds provide an image of what I'm saying; for all are undistinguished in the whole, and the *logoi* are as it were in one center; there is one *logos* of the eye, another of the hands, known to be other from the visible thing generated from it. The powers in the seeds are each of them one whole *logos* with the parts wrapped up in it; the bodily has a matter, for example some fluid, but the *eidos* itself is the whole and a *logos*, being the same in *eidos* as the soul in the generator, which is an image (*indalma*) of another better soul. Some call this power in the seeds 'nature,' which was driven thence from those prior to it, as light from fire, and it turns and enforms the matter, not relying on the help of those much—discussed mechanisms (levers), but by imparting the *logoi*. (V.9.6: my translation)

In the context, Plotinus is trying to explain how the mind contains many different sorts of knowledge simultaneously, how the mind can, as Aristotle put it, think all things. The 'seed image' argues that the mind thinks all things in a way analogous to that in which semen contains all the parts of the body which it generates. Bréhier, in his note to this passage, supposes that Plotinus commits himself here to preformationism, the theory that the parts are already present in the semen determinately. It seems to me more likely that Plotinus is aiming at something closer to what we would call an epigenetic position, not so very dissimilar from Aristotle's, since what is present in the seed is not the parts, but the *dynamis* (powers) for bringing the parts into being. Plotinus actually paraphrases some of Aristotle's account of sexual generation—his use of the word '*emperiēchomenon*' ('wrapped up in') echoes Aristotle's use of the word '*emperilambamenon*' at *De Generatione Animalium* II.3, 736b36. Further, Plotinus says explicitly that the *logos* as *dynamis* enforms nothing more than something fluid when it is in the seed, that it is the power to bring about the development of the organ, and not the organ itself. Plotinus, as I understand this passage, accepts the Aristotelian doctrine that there are active powers present in the seed, and calls them *logoi* as does Aristotle himself. But Plotinus cannot have the entire Aristotelian theory of sexual generation, since he does not have the passive powers, the capacities of materials to be acted upon by those active powers or *logoi*.

We may discern some other unAristotelian ideas in the passage. The notion that the generative soul is an image of another better soul would be puzzling from an Aristotelian point of view—plants have only generative soul, yet are perfect of their kind. Certainly mind and entities that have minds are regarded by Aristotle as much as by the Neoplatonist as the 'best' entities that exist, but the structuring of the continuum between the various psychic functions by means of the image-relation (*mimēsis*) would be alien to Aristotle, and not readily explicable in terms of the physiological structure of plants in comparison with animals and human beings.

Another peculiarly Plotinian touch is the suggestion that the nature present in generation is caused to act by something else not present, "as light from fire"—in other words, as an action ('emanation'?) from some higher power. For Aristotle, the nature present in generation is a tool, (*organon*), of the male parent, and even perhaps of the male line going back to some distant progenitor, but the moving cause in generation is not traced to a transcendent origin. To be sure, Aristotle does say in

*Metaphysics* A.5 that the causes of a person are the elements, the father, and "besides these the sun and its oblique course" (1071b15) but that means little more than that the climate, the existence of a biosphere, and perhaps a propitious season of the month or year, are necessary conditions for individual acts of procreation.

Plotinus seems to take a slap at Aristotle's account of sexual generation when he attacks the appeal to mechanisms, since it is at just this point in his argument that Aristotle appeals to the marvelous automatic puppets (*De Generatione Animalium* II.5, 741b8). It is as if Plotinus were saying that his version of the theory of sexual generation is more purely Aristotelian, more purely antireductionist, because it explicitly refuses *any* appeal to mechanical explanation, relying *only* on the image of the propagation of the *logos*. The refusal to accept Aristotle's mechanical analogy is symptomatic of what I take to be the central problem with Plotinus' implicit explanation of sexual generation: For Aristotle, the mechanical image is introduced to show how active and passive powers can work upon each other in series, until a final result is obtained. For Aristotle, the seed has the power of making, and in a way becoming, the source (*archē*) of the body, which in turn makes the rest of the body. The male and female seeds have in them all the parts *as powers*, but not as actualities; Plotinus appears to agree. But Plotinus does not seem willing to distinguish active and passive powers, and thus cannot easily explain why the actual presence of the *logos* does not also mean the actual presence of the part. It is because of this embarrassment, as I would call it, that Bréhier concludes that Plotinus must have meant to assert preformationism in this passage. It makes more sense to put Plotinus in the epigenetic camp; after all, the mind is not simultaneously conscious of all the thoughts of which it can be conscious. Thoughts which are not currently conscious are present in the mind as *logoi*, as *dynamēis* (*passive powers*), according to this passage. A preformationist image of thought would have all thoughts actually present consciously simultaneously—that certainly won't work!

Although we may discern some distinctions between Aristotle's theory of sexual generation and its altered form in Plotinus, ultimately neither version is especially convincing. Neither Aristotle nor Plotinus imagines anything remotely ancestral to our DNA and so on, nor do they observe the patterns of heredity which we associate with Gregor Mendel. Both Aristotle and Plotinus knew that information, *logoi*, has to be transferred from parent to child through the generative materials, but neither had any real notion of how. The theory expressed in this passage

of Plotinus is largely derivative from Aristotle, but it is less successful, vaguer, less argued, less developed.

### 3. *Enneads* III.8

In III.8, Plotinus takes up the theme of sexual generation again, and clarifies the place of generation in his system. In this important tractate Plotinus argues that generation is the actualization of *theoria* (contemplation). He admits the paradoxical look of that notion, since the first word of the tractate is 'playing' (*paizontes*); but he becomes quite serious in his defense of the thesis that all nature both stems from *theoria* and aims in all natural processes toward an actualization of *theoria*. This thesis he believes to be true of the universe as a whole, of humankind including children, of animals, plants, and the changing character of the inanimate world.

The interpretation of *all* natural change as an urge toward *theoria* is, I suppose, a radical interpretation or application of Plato's doctrine of *eros* (love).<sup>7</sup> Plato had suggested the possibility of the general application of the doctrine of *eros*, first in the *Symposium*; one might want to take it as Plato's solution of the problem of explaining goal-directed change. But we may remember that Aristotle, in *Metaphysics* A, charges that Plato *fails* to explain goal-directed change, despite the well-known criticism which Socrates in the *Phaedo* directs at Anaxagoras for the same failure. In the *Timaeus*, the most 'scientific' of the dialogues, Plato uses neither *eros* nor *theoria* in biological explanation. It was left to Plotinus, among others, to make the connection.

Rejecting all mechanistic explanations of life, Plotinus asks rhetorically: "What jostling, what levers could bring about all those colors and forms?" (III.8.2) The reference to jostling (*ἄθισμος*) sounds very like an explicit rejection of Epicurean atomism. As if the rejection of mechanistic explanations were to imply idealism directly, Plotinus immediately claims that nature is an 'unmoved form,' a *logos* which produces another *logos* in animals and plants (III.8.2). Since nature itself is not identical to the *logos* which is in the entity produced, and it is not an action, it must be a *logos* which is simultaneously a *theoria* (III.8.3); this means to me that Plotinus believes that a *logos* which is separable from a particular physical entity, yet identifiable in some sense as the *logos* of that entity, must be 'theoretical' in this special sense. The idea that nature is an unmoved mover in that to which it belongs primarily is

not, of course, an unAristotelian notion, but the separation of the nature from the generated entity *is* unAristotelian, and makes a purely biological analysis impossible. Indeed, it tends toward a personification of nature, and Plotinus succumbs to that temptation with poetic enthusiasm.

Personified nature is represented as telling us that the generated entity is the *theama*—the visually produced presentation—and the *theorema*—the object of contemplation and so on—of nature; that nature is generated by the *theoria* of higher entities, and reflects that activity in natural generation. Plotinus has nature saying (I paraphrase): "As the lines drawn by the geometer are the *theoria* of the geometer, so when I theorize, the limits of body come into being, as if from me" (III.8.4). This literally 'theoretical' understanding of the activity of nature is applied directly to sexual generation at the end of III.8.7:

When an animal generates, the *logoi* within move, and this is an activity of *theoria*, and a labor of giving birth to many forms and many objects of *theoria*, to fill everything with *logoi* and thus always to theorize; for to make something is to make an *eidos*, but this is to fill things with *theoria*.

This is obviously meant to answer the question, why do kinds of animals continue to generate offspring? It might help to compare the answer given by Aristotle, that sexual generation occurs so that each *eidos* may be everlasting in the way open to it; Aristotle does not argue, at least not in *De Generatione Animalium* II.1 where this question is discussed, for a principle of plenitude. He seems to imagine that all the natural kinds which exist today have always existed and always will exist, if only contingently. Plotinus, in contrast, tells us that the *logoi* actualize themselves in the generation of forms, and the actualization of a plenitude of forms is the theoretical activity of nature.

It would be difficult, but not impossible, to develop an Aristotelian theory of the evolution of different kinds of animals. An Aristotelian *genos* is a *lineage*, a hereditary line, and an Aristotelian *eidos* is an appearance as much as anything else; nothing prevents individuals in a *genos* from being different in *eidos* from other individuals of that *genos*, so a failure of the male seed to dominate, or the recalcitrance of the material presented, could well result in an offspring which was not of the same *eidos* as its parents (Cf. *De Generatione Animalium* IV.4, 770b3ff). The most likely case is that the offspring is *defective* in some way, but what if the offspring were in some respect 'better' than its parents? What would Aristotle say then? Certainly *not* that the improvement could be

ascribed to *chance*; that is one consequence of the criticism which he levels (more than once) at Empedocles, for example (Cf. *De Partibus Animalium* I.1, 640a19ff). If there *were* an improvement from parent to offspring, the cause would have to be found in something superior to the parent, implicitly containing the form which appears explicitly in the offspring. Aristotle never suggests that he considers the possibility of such an explanation within a biological realm, to the best of my knowledge, but he does suggest a comparable explanation of the 'evolution' of the *genos* 'tragedy' in the first part of his *Poetics*. There, obviously the higher source of form is human experience, which tragedy partly imitates.

In contrast, it would be a delightful exercise to construct a Plotinian evolutionary theory. Genetic lines could be seen as generating variations in much the same way as a rational being generates hypotheses; stable species might be compared to theories with a high degree of confirmation, the forces which limit the reproduction of some of the variant forms might be compared to the rebuttals and refutations to which hypotheses are subject. If Plotinus had been acquainted with paleontology, how pleased he could have been with *that* spectacle of concrete dialectic!

But Plotinus has a difficult time explaining those productions which seem best understood as failures of generative processes; in III.8.7 his reasoning is brief and unsatisfactory:

Errors occur in things generated and things done when the theorizing gets carried away from the object of theory. The bad workman is the one who makes ugly forms. Lovers see and strive toward the form.

The explanation may be traced to Plato's *Republic* (X, 601c–602a: the maker has only belief about how things should be made; the user knows) and to the charioteer of the *Phaedrus*, led astray by the mistaken theorizing of the ignoble horse (248b: feeding on the food of semblance). The trouble with this sort of explanation of biological 'error' is that it always places the blame on the formal, what Plotinus calls the theoretical, and thus on the active cause, and never on the matter. It would lead to some rather strange explanations of birth defects, as if they were always caused by defective genetic structure, and never by environmental or nutritional defects.

The extension of *theoria* throughout living processes is explained, to some degree, by a distinction made most clearly at III.8.8: all life is

thought (*noēsis*), but there are at least three levels of thought: vegetative thought, sensitive thought, and ultimately psychic thought. Probably we would not be wrong to add 'mineral' thought at one end of the scale, and 'divine' thought at the other. That is a direction of investigation taken up later by several philosophers, notably Leibniz.

A more clearly biological direction is taken at III.8.10, where life is compared first to an inexhaustible spring, from which flows or emanates all things. More to our point, life is then compared to a tree:

The life of a great tree goes out to all parts, yet remains a source (*archē*) and is not dissipated in the whole as it rests in the roots. This source furnishes the whole life to the tree, but it remains itself, the source of the whole, and not many things.

This 'Yggdrasil' (so to speak) is for Plotinus an image of the unity of life, the unity of the soul, the unity of the universe. This tree motif also appears in III.3.7, where (I am paraphrasing now) the source (*archē*) is said to be all in one, immobile as a root; the parts which grow out from it carry an image of the source; the parts closest to the roots contain the others, which going out split ultimately into twigs, leaves, and fruit. Some parts live for a season and die; others persist, generating again new leaves and fruits, and having in them the seeds of the prior parts, as if they wanted to become in their turn small plants. Although each growth seems to come only from the neighboring branch, in fact it comes from the source, which in turn depends upon another source. According to Bréhier, this image had already appeared in Philo of Alexandria's *De Plantatione* #4ff; certainly it expresses a view of life which draws upon biological understanding, and in turn contributes to a biological interpretation of the world. The concept of the universe as one living organism, familiar from the beginning of the *Timaeus* (and Cf. *Ennead* III.2.7), requires an examination of the characteristics of organisms as its basis, and as a part of its heuristic program."

#### 4. Excursus

Nevertheless, Plotinus did not actually *do* any biology, and he took little interest in the biological investigations carried out by his predecessors, even by his Platonistic predecessors. Despite that abstention, his contributions to the history of biological thought are neither negative nor neutral. The philosophy of Plotinus is a most

energetic defense of the thesis that we should investigate form rather than matter, principles of unity rather than principles of disunity; that one should expect to find universal laws of nature, and unified sources of life, rather than special principles, separate causes, accidents, multiplicities.

No one among the immediate followers of Plotinus was prepared to follow this vision as a scientific goal, and probably nothing Plotinus said or did would encourage scientific investigation as a way of life, but it is not unreasonable to suppose that the indirect influence of Plotinus has been one of the many sources of the modern synthetic theory of living nature. We have indicated some of the ways in which his thought leads toward an evolutionary theory, a theory perhaps more like that of Lamarck than that of Darwin, but closer to modern viewpoints than the apparent immutability characteristic of Aristotle's biology. In addition, Plotinus contributed heavily to the sources of the vitalistic theory of life, and vitalism has certainly played a large role in the turn toward biological science, and away from the radical reductionism of modern physics, during the past hundred years or so. Sometimes the role of vitalism has been more dialectical than constitutive, but it continues to be an important theoretical force. Schuhl's reference to Bergson is not amiss, not only in that Bergson read and lectured upon Plotinus, but also because Bergson and others philosophically akin to him have forced twentieth-century biologists to define clearly the ways in which living beings are based upon nonliving structures, and in what ways living beings differ from nonliving systems.

Nothing could contribute more, in the long run, to biological thought than a thoroughgoing love of the natural world, in all its complexities and flourishing variations. I believe that Plotinus laid the groundwork for that love, without doing much about it himself; of his immediate successors, only Porphyry pursues any biological interest so far as I can see, and that seems to be limited to his spirited defense of vegetarianism in the *On Abstinence from Animal Food*.<sup>1</sup> But later Neoplatonists *did* take up the challenge; more about that on another occasion.

# PLOTINUS AGAINST ARISTOTLE'S ESSENTIALISM

Lloyd P. Gerson

Aristotle's criticisms of Platonism frequently appear in a simple logical form: if P, then Q. But Q is absurd, therefore P is false. For example, if Forms exist, then the reality (*ousia*) of something will be separate from that thing.<sup>1</sup> But it is absurd that the reality of, say, a man should be separate from the man. Therefore, Forms do not exist. Why exactly is it absurd for the reality to be separate? Aristotle is not very explicit on this point. The central books of the *Metaphysics*, however, make it sufficiently clear that since reality (*ousia*) accounts for the being and unity of a substance, to separate it is to make unaccountable a substance's identity.<sup>2</sup> This claim might be formulated as follows. For any sensible substance S, there must be a true statement of the form 'S is P' where 'is P' indicates some sort of identity with a natural kind P. If the reality of S were separate, then there would be no such true statement. This I take it is just an explication of what it means to claim that a substance is a particular or 'this-such' (*tode ti*). Thus, for Aristotle, if the Form of Man is separate from Socrates, then it is false that Socrates is really, that is, essentially, a man. Perhaps he could turn into a cat. But this is thought to be absurd because Socrates' identity is determined by his being a man.

Some modern defenders of Plato are inclined to respond to Aristotle's attacks by denying that Plato's doctrines entail the absurdities indicated by Aristotle. For example, Harold Cherniss seems to argue that the separation of Forms does not entail that 'the reality of a particular' is thus separated from it. For the Forms are not intended to account for this reality.<sup>3</sup> So presumably, for Cherniss it does not follow that Socrates cannot have an essential identity as a man if the Form of Man is separate from him. Socrates is a man because he participates in the Form of Man. I think that Cherniss in his zeal to show Aristotle's lack of understanding of Plato's position has in fact himself misunderstood Aristotle's point. I take it that the point is that if the Form of Man is separate, then there is no way that the *identity* of Socrates is fixed by that Form. It is, thinks Aristotle, absurd

that the reality of a man should be separate from him because the reality of a man is just his identity. His identity is determined by the essence predicated of him.

In contrast to Cherniss's continual refusal to accept the implications that Aristotle draws from his interpretation of Plato's claims, Plotinus embraces the other extreme. He simply accepts it that if Aristotle says that if Plato says P, then Q follows, then this is indeed so. It is evident, though, that he does not accept Aristotle's interpretations and their implications because he believes that Platonism is absurd. Rather, his approach is to embrace the putative absurdity and to show that in fact it is true largely because the (Aristotelian) alternative is itself absurd. I think that in the above example Plotinus understands Aristotle's point better than Cherniss does. If the Form of Man is separate from Socrates, then the identity of Socrates is not determined by that Form. 'Socrates is a man' is not in any sense an identity statement. Hence, essentialism and the substance metaphysics from which it is inseparable, are false. Plotinus, unlike Cherniss I suspect, thinks that this is what Plato holds and that Plato is right to do so. In the remainder of this paper I will try to show why Plotinus thinks that Aristotle's criticism of Plato turns upon itself and serves to vindicate a rejection of essentialism in the sensible world.

Plotinus' analysis of 'Socrates is a man' is definitely peculiar.

For when I predicate 'man' of Socrates, I mean it not in the sense in which the wood is white, but in the sense that the white thing is white; for in saying that Socrates is a man, I am saying that a particular man is man, predicating man of the man in Socrates; but this is the same as calling Socrates Socrates, and again as predicating 'living being' of this rational living being.<sup>4</sup>

It is clear that in this passage Plotinus is interpreting what Aristotle would call the 'said of relation' between secondary and primary substance (*ousia*) and which is expressed grammatically as 'Socrates is a man' in terms of Platonic participation. For Aristotle, 'Socrates is a man' is based on an analysis which yields the priority of the individual over the form along with their real distinction. For Plotinus, 'Socrates is a man' means that Socrates partakes of the Form of Man. But what is Socrates? A man, of course. There does, however, seem to be a good deal of difference between saying that this man partakes of the Form of Man and that Socrates is Socrates, counter to what Plotinus says. For in the former case there is a distinction between the instance of the Form and the Form: in the latter case there is an identity statement. Or perhaps it is not quite so straightforward. It is true that Plotinus wishes to insist on a distinction

between an instance of a Form and the Form itself. But he also must insist on their identity, otherwise instantiation would be entirely opaque.<sup>5</sup> So, the man that Socrates is, is and is not identical with the Form of Man.<sup>6</sup>

I think we can better understand these obscure claims as intended to be directly inferable from a denial of what Aristotle says. Assume that the essence of man is the Form of Man and that this is separate. Nevertheless, Socrates is a man because there is humanity in him just as Helen is beautiful because there is beauty in her and a building is tall because there is tallness in it. Why cannot we say then that if humanity is in Socrates, then the essence of humanity is in Socrates and that therefore Socrates is essentially a man? The simple response to this question is that the essence of humanity is identical with the Form of Man and this is separate. But why we might ask is it not enough that there be humanity in Socrates in order for us to say that the essence of humanity is in him and that he is essentially a man? It is not enough because unless Socrates is identical with that essence, its presence does not make Socrates essentially a man anymore than, say, having the essence of baldness in him makes him essentially bald.

Then why not take the next obvious step and just say that Socrates *is* identical with his essence? From Plotinus' perspective, the answer to this question is that we must refrain from doing so because it is false, and furthermore, Aristotle himself must admit this. In chapter 6 of *Metaphysics Z* Aristotle raises the question of whether each thing and its essence (*to ti ên einai*) are the same or not. Answering this question, says Aristotle, is useful for the investigation of substance because each thing is thought to be nothing else than its own substance, and this substance is said to be to essence.<sup>7</sup> The answer given to the question at the end of the chapter is that "of things which are primary and are stated by themselves [*kath' auta legomenôn*], then, it is clear that each of them and its essence are one and the same."<sup>8</sup> But for us and no doubt for Plotinus the obvious puzzle is just what these things 'which are primary and are stated by themselves' are supposed to be. A passage a bit further on in chapter 11 supplies the answer: "And we have stated that in some cases the essence of a thing and the thing are the same, as in first substances; for example, curvature and its essence are the same, if curvature is a first substance. (By 'first substance' I mean one which is not stated as being in something else in an underlying subject as in matter.) But things which exist as matter, or which include matter, are not the same as their essence; nor are those things which are one by accident, such as Socrates and the musical, since these are the same by accident."<sup>9</sup> It seems plain that 'first substance'

is equivalent to 'things which are primary and are stated by themselves' and equally clear that Aristotle excludes sensible composites from this class. The reason given is that the composite is in an underlying subject, its matter. Thus, in the next book Aristotle says: "For a soul and the essence of a soul are the same, but the essence of a man is not the same as the man, unless also the soul is called 'a man'; accordingly, in some cases a thing and its essence are the same, in others this is not so."<sup>10</sup>

According to Aristotle's own analysis, a sensible substance does not seem to be identical with its essence because that substance includes matter. Therefore, the putative absurdity of separating the essence of humanity from Socrates cannot consist in the non-identity of Socrates and his essence. This much Aristotle admits. How then can Aristotle infer from the Platonic proposition that Socrates is a man because there is humanity in him to the anti-Platonic conclusion that Socrates is essentially a man? For it is evident that this is just the inference that Plotinus refuses to make. The answer is roughly that the sensible composite, Socrates, is qualifiedly identical with his essence according to the order of act and potency. This man and 'what it is to be a man' are thus related.

It cannot be stressed too strongly that Plotinus' reasons for denying this claim are not based on his rejection of the basic distinction between act and potency. Quite the contrary. Plotinus makes abundant and fruitful use of the distinction when addressing numerous metaphysical and epistemological problems. Indeed, despite his rigorous negative theology, he will insist that the source (*archē*) of all, the One, is properly identified as perfect actuality (*energeia*).<sup>11</sup> So it is somewhat puzzling why Plotinus wants to maintain an extreme position that might reasonably be thought to be defeated by employing the distinction between act and potency.

Against Aristotle's assertion that 'man and what it is to be a man are not identical'. Plotinus says 'the Form of Man and man are identical,' holding that the 'what it is to be' of anything is in fact a Platonic Form.<sup>12</sup> Aristotle can say that 'Socrates is a man' is an identitive use of 'is' and not predicative without holding that 'man and what it is to be a man are identical' just because there is a real distinction *within* Socrates between the composite individual and the form of man.

Plotinus sees a contradiction latent in Aristotle's position. On the one hand, Aristotle wants to say that sensible composite is related to essence as act to potency. But Aristotle also want to hold that the sensible composite is *posterior* to the form because it is not perfectly actual.<sup>13</sup>

The crux of the dispute between Plotinus and Aristotle comes down to this. Grant that 'S is P' but that whatever is P's nature is not

unqualifiedly identical with S. It would seem that all anti-nominalists, Plato, Aristotle, Plotinus, *et al.* must grant this much. Let us grant further that form and actuality are identical.<sup>14</sup> Then, how is S related to that nature of P in terms of priority and posteriority in reality? For Plotinus, the correct answer is unavoidably Platonic. Somewhat less tendentially, the position which at once maintains that act is prior to potency, that form is act, and that the composite is posterior to form, cannot consistently also maintain that the composite is prior to the form which is not identical with it.

An Aristotelian will no doubt want to object that this argument depends on an equivocation. For the sense in which a sensible composite is prior in actuality to essence is different from the sense in which form is prior to sensible composite. The priority of form to sensible composite refers only to the priority of non-sensible form which is substance. A sensible form such as the form of man, which never exists separately, is always posterior in actuality to the composite. Form and essence are identical only in the former case, never in the latter. If the form of man could exist separately, then it would indeed be incoherent to hold that there is one actuality, this man, and another actuality, the separate form.

This objection, however, is circular. It depends on saying that the form of man does not exist separately because it is a sensible form. What is the proof of this? Just that man and 'what it is to be a man' are not identical. And this is so because the reality of man is the man and not 'what it is to be a man'. But this is precisely what Plotinus denies when he asserts that the true man is the Form of Man.<sup>15</sup> Plotinus does not deny that there is a distinction between the sensible form and the Platonic Form. Rather, he holds that the former is posterior to the latter. The instance of the Form is an image of it.<sup>16</sup> Let us consider both claims in turn.

Plotinus wants to hold that if a sensible form is posterior to a Platonic Form, then they cannot be related according to the order of act and potency.

For literary skill [*hō grammatikē*] is not posterior to the particular literary skill but rather it is because literary skill exists that that in you exists; since that in you is particular by being in you, but in itself is the same as the universal. And Socrates did not in his own person give being human to the non-human but humanity gave being human to Socrates: the particular human is so by participation in humanity. Since what could Socrates be except 'a man of a particular kind' and what could the 'of a particular kind' do towards being more of a substance?"

I believe the following argument underlines this passage. The relation between humanity, i.e., the Form of Man, and particular instances of this Form is a one-many relation. So too for the Form of Grammaticality or Literary Skill and its instances. In such a relation, the one is prior to the many, because it is the source (*archē*) of the many. And this priority is not that of potentiality to actuality. This is so because if a subject has a property that *could be* instantiated in another subject, the explanation of this is that they are instances of the same thing. But a potentiality as such does not explain anything because potentialities as such are not actual. No one would, say, accept the potentiality for death as an explanation of death or the potentiality for learning as an explanation for learning. These are at best conditions for their actualization. But the conditions are dependent on actualities. Thus, having the potentiality for death is a condition of an actual body.

To say that a Form is the source (*archē*) of its instances is in part to say that it is the explanation of instantiation or of identity in difference. If more than one thing has the same property, then the explanation of this must at least start with the existence of the property as distinct from the instances. It is of course not to the present point that a nominalist would deny the antecedent of this claim. Aristotle must allow that there is such a datum to be explained, but there is no question of a property serving an explanatory function by being potentially its instances. It is not even coherent to say that the explanation of Socrates possessing an instance of the Form of Man is the (his?) potentiality for being a man.

Recall that the question of the priority and posteriority of man and 'what it is to be a man' is occasioned by Aristotle's own conclusion that only in primary substance are they the same and that sensible substances are not primary. Aristotle thinks that it is absurd that man and 'what it is to be a man' should be the same because then 'what it is to be a man' will be a man. But this only follows if one *assumes* that 'man' must refer primarily to Socrates. Such an assumption is a stellar example of being misled by language. There is no substantial dispute between Aristotle and Plotinus regarding the possibility of designating a sensible particular such that no non-sensible particular can be named univocally with it. Let 'man' stand for 'image of the Form of Man' and 'what it is to be a man' stand for 'Form of Man'. Then Plotinus would agree that it is absurd that 'what it is to be a man' should be a man. The issue is not the irreducibility of instance and universal, but their relative priority. When Plotinus asserts that the true man is the Form of Man it is the issue of relative priority that he is addressing.

The priority of Form to instance is characterized by Plotinus in the much maligned language of imagery. Plotinus' position is that substance is said homonymously (*homonymōs*) of intelligible being and sensible bodies.<sup>14</sup> There are many passages in which Plotinus stresses the homonymy of the sensible world in general.<sup>15</sup> Aristotle clearly distinguishes between a term said homonymously of two things and a term that is relational (*pros hen*).<sup>16</sup> So, it would seem that Plotinus is denying a relational connection between the substance of the Forms and substance when said of sensibles. On the other hand, he also seems to connect them as 'prior' and 'posterior', which is not the way that things merely with a name in common are usually described.<sup>17</sup> This is in fact to be expected where sensibles are images of Forms. As we saw in the passage quoted above, an instance of a Form 'is the same as the universal', though 'posterior' to the Form. For example, a drawing of a house is, as image, posterior to the real house, though its proportions may be the same as those of the house. But its proportions are not equivocally those of the house; they are the same, though posterior. Another example would be a film which is homonymously that which it images, but which also contains synonymous images as well, such as the words spoken by the actors.

In general, synonymous images are univocally named with their models, even though they are posterior. In this matter, Plotinus is actually following Aristotle's principle. For in the *Metaphysics* Aristotle asserts, "of things to which the same predicate belongs [*hyparchei to synōnymon*] in the highest degree is that in virtue of which it belongs also to the others. For example, fire is the hottest of whatever is truly called 'hot', for fire is the cause of hotness in the others."<sup>18</sup> In the *Organon* there is a precise and consistent meaning for synonymy (*synōnymon*): when things have a name in common and also the definition corresponding to the name, they are synonymous.<sup>19</sup> Synonymy implies univocal predication. Thus, fire and water can be said to be hot univocally, even though fire is the cause of hotness in the water and so is prior. I have elsewhere argued for the Platonic nature of such a claim and Aristotle's reasons for ultimately abandoning it.<sup>20</sup> The point here is that a Platonist is committed to such priority and univocity for Forms and instances. The priority follows from the argument discussed above. The univocity follows from the kind of explanatory entity that a Form is. The Form of Humanity explains the identity in difference of many men in the sense that it is just what is identical in all the many.

This point is misunderstood by many, including many modern defenders of Plato, because it is thought that synonymy excludes

homonymy and hence the diminished reality of the sensible world. Thus, a false dichotomy is set up, one which perhaps leads Aristotle to suppose the obvious reasonableness of his own position and the absurdity of the Platonic alternative. If synonymy obtains between Form and instance, then priority of Form to instance is gainsaid. If homonymy obtains, then priority and posteriority can be claimed, but we are saddled with the quaint conceit that the real man is the Form of Man, not Socrates. We have, as Aristotle would put it, just copied the real world onto a notional world and arbitrarily transferred the appellation 'real' to the latter. But Aristotle himself testifies that priority and posteriority can coexist with synonymy, albeit his later conclusion that this is false for 'being'.

In effect, Plotinus wishes to hold that when there is priority and posteriority along with synonymy, as is the case with Forms and their instances, the priority and posteriority is to be analyzed as homonymy in being. The diminished reality of the sensible world, occasioned by the separation of Forms in the first place, is explicated as synonymy in nature and homonymy in being. Thus, there is humanity in Socrates, but this nature or form is present in a mode of being different from its primary mode. For one thing, the Form of Man is eternal, and the humanity in Socrates is temporalized. For another, the Form of Man is thoroughly transparent or intelligible, while the humanity in Socrates is infected with matter.

Perhaps the most illuminating and relevant example of homonymy combined with synonymy in representations is from Aristotle's realist epistemology. According to Aristotle's account, knowledge is the identification of knower with the form of a knowable object. The form in the intellect is synonymous with the form in that which is known, but cognitive being is homonymous with the being of the knowable. The concept of humanity is not a man. That is what homonymy indicates. But the form of humanity in the intellect really is that form. It is not an approximation or arbitrary symbol of it. That is what synonymy indicates. The real and the cognitional are ordered as prior to posterior.

Plotinus' point is that the Form of Man is related to the individual man analogous to the way the individual man is related to the form of man in the intellect. His reasons for holding against Aristotle that the being that is prior to cognitive being is itself posterior to a Form are twofold. The first reason is as we have seen that actual Forms are needed to explain the phenomenon of identity in difference. The second reason is Aristotle's own admission that the sensible composite is not substance in the primary sense. It is quite outside the scope of this paper to argue the case that

Aristotle's account of the relation of the absolutely prior unmoved mover to sensible substance is inadequate. It is appropriate to stress, however, that given Aristotle's hypothesis that being is substance, the posteriority of the sensible substance provides the groundwork for at least the homonymy in Plotinus' analysis.

From Plotinus' perspective, Aristotle has practically conceded the posteriority in being of the sensible composite. Furthermore, in the implication of his argument that primary being is to be identified with separate form, Aristotle has taken the next important step.<sup>2</sup> The last crucial concession that Aristotle refuses to make to the Platonic position is the recognition of the priority of separate form to the form of sensibles analogous to the priority of the form of sensibles to cognitive form. Aristotle seems to believe that the form of sensible composites, unlike the form that is primary being, could not exist separately. There is no reason actually given for this claim in the *Metaphysics* so far as I can tell. Perhaps his reason is that in a sensible composite there is one actuality, the composite itself. The form could not exist separately because for it to do so it would have to have its won actuality. But that would mean that in the sensible composite there are so to speak *two* actualities, that of the form and that of the composite. So, the unity of the sensible composite can only be preserved if the form is not an actuality apart from the composite.

Plotinus would find this line of reasoning unpersuasive for at least two reasons. First, the preservation of the unity of the sensible composite is only a desideratum if one is committed to holding that sensible being is primary being, as Plotinus and presumably Aristotle are not. By contrast, the unity that a dependent being has can be compromised. Second, Aristotle identifies form and actuality. It is unclear why this should be so for the separate form but not for the form of the sensible composite. If it is true for the latter as well, then there is no reason why that form cannot exist separately except that its actuality in the sensible composite would undermine its unity.

What Aristotle finds incomprehensible in the Platonic position and what Plotinus takes pains to defend is the claim that 'what it is to be P' and 'P' are the same. This might be understood to mean that either now there are two men or there are none, because the essence has been separated from what it is the essence of. But once homonymy is combined with synonymy, one is not obliged to say either that the Form of Man is a man or that Socrates is not a man because the essence of man is separate from him. He participates in the essence and so he is a man, but he is not identical with the essence.

Plotinus' alternative to essentialism is to say that the sensible composites is a 'conglomeration' (*symploresis*) of qualities and matter, or bodies.<sup>28</sup> The qualities are just the instances of Forms, or what Aristotle would call sensible forms. Since the only subject in these conglomerations is matter, Aristotle's claim that essence is what a thing is in virtue of itself is rejected.<sup>29</sup> Thus, Socrates is not essentially a man. He is the actual composite of qualities in matter. These qualities in matter, like the visible qualities 'tall' and 'white' are images of Forms. These images bear their names univocally with Forms. But their *logoi* necessarily include matter. Thus the tallness in Socrates is self-identically tallness, like the Form. But the tallness in Socrates is necessarily the particular tallness of a body. So, the composite Socrates, who is just these qualities in matter, is an homonymous image of the Form of Man, 'containing' a synonymous image, namely, an instance of the nature of man.

It might be objected, however, that if qualities A, B, and C together in matter represent the Form of Man, then the essence of man is in the individual man just if the essential qualities are present. For the presence of the essence is just the presence of the representation of the Form. But unless the essence identifies Socrates, then Socrates is not essentially a man any more than he is essentially any other quality that he may have. In one sense, Socrates is indeed identified by all his qualities. Plotinus is not denying this. But the essentialist needs a special identifying sense for the essential qualities. And so long as Socrates is not identified with these, he is no more essentially a man than his body is essentially seated at any one moment or essentially bearded. So, we have to say that Socrates is a man if there is manness in him, but he is not essentially a man.<sup>30</sup>

Should we then allow that Socrates could become, say, a sparrow? One might suppose judging from what Plotinus says about reincarnation that the answer is yes. I think that would be too hasty an answer. For the Socrates now at issue is the sensible composite and it is false that the sensible composite is reincarnated as anything. It is the soul of Socrates that may enter the body of another animal. This suggests that the identity of Socrates is not the identity of a sensible substance (*ousia*) but that of a soul which exists apart from the body. This of course is what Aristotle explicitly denies. The identity of the individual sensible composite, however, severed from essence, is not non-arbitrarily determinable.

The abandonment of Aristotelian sensible substance as determined by essence is complete in Plotinus' embrace of what Aristotle regards as an absurdity: that we make substances out of non-substances.<sup>31</sup> Plotinus here of course means putative sensible substances. They are constructed out of

qualities and matter. This apparently means both that we designate various 'conglomerations' as substance and that the elements of these conglomerations are matter and qualities. This naturally invites the question of whether matter then becomes substance, a result that Aristotle declares is impossible.<sup>32</sup> It does not become so for Plotinus any more than for Aristotle, because matter is not a 'this something'.<sup>33</sup> Its identity is not determined by essence.

Owing to the fact that qualities or instances of Forms are univocally bearers of the Forms' natures, pragmatic categorizations of sensible composites are possible.

But what species of it [sensible substance] should one posit, and how should one divide them? Now the whole must be classed as body, and of bodies some are matterish and some organic; the matterish are fire, earth, water, air; the organic the bodies of plants and animals, which have their differences according to their shapes [*morphas*]. Then one should take the species of earth and of the other elements, and in the case of organic bodies one should divide the plants, and the bodies of animals, according to their shapes; or by the fact that some are on and in the earth, and, element by element [one should class separately] the bodies in each; or [one could class them on the ground that] some are light, some are heavy, and some in between, and that some stand in the middle, some surround them above, and some are in between; and in each of these the bodies are already differentiated by their outlines, so as to be some of them bodies of celestial living beings and other appropriate to the other elements; or one should divide the four according to their species and afterwards proceed in another way to weave them together by blending their differences according to places and shapes and mixtures, classing them as fiery or earthly, called so according to the largest and predominant element [in the mixture].<sup>34</sup>

It is important to grasp what is and what is not being suggested here. Plotinus wants to maintain that, say, the Form of Man is present in the sensible composite that is called 'Socrates'. The Form of Man is eternally self-identical and distinct from the Form of Horse. But since so-called sensible substances are not identical with the natures of Forms, the classifications of these composites must occur through perception.<sup>35</sup> Knowing what the Form of Man is does not provide the criterion for classifying a conglomeration of qualities and matter. We can call one organic composite a man and one a horse owing to their shapes (a quality plus a mass of extended matter), but this does not imply that things with these shapes are essentially human or horse. It is appropriate in this context to recall Plato's argument that Forms are manifested in sensible instances

via material that can also instantiate opposite Forms. Thus in the first book of the *Republic* returning someone's possession can be an instance of justice, but it can also be an instance of injustice. And in the *Symposium*, Beauty can be manifested in a body, but bodily qualities are not essential to the manifestation of Beauty, for Beauty can be manifested in non-bodily souls.

A classification of conglomerates is a classification of homonymous images. Take a drawing of a conical shape. Is it a tepee or an ice-cream cone? The answer is purely contextual or pragmatic because what the drawing is of is not entailed by the shape. The conical shape, however, is or contains a synonymous image of the Form. The classification of homonymous images, like sensible composites, in terms of synonymous images, like the instance of Forms, is interdicted because sensible composites are bodies that contain matter. There is no more of a necessary connection between these two types of images than there is between the proportions of a drawing and the medium in which the drawing is rendered.

The statement 'Socrates is necessarily a man' can be understood in two ways. In one way, Socrates is necessarily a man because 'Socrates' stands for a man, as Plotinus says. So necessarily, this man (the sensible composite) is a man. But this *de dicto* necessity will of course not do as an interpretation of Aristotelian essentialism. In another way, Socrates is not necessarily a man because there is no necessary identity between the subject, matter, and the sensible qualities that together make up the conglomerate. The matter in this composite could have and might yet participate in the Form of something other than Man. Therefore, there is no *de re* necessity in the connection of subject and essence. For Plotinus, the common sense plausibility of Aristotle's position actually trades on the ambiguity of these two types of necessity.

 34. I take it that at VI.3.1, 13–16, when Plotinus proposes to order sensibles in terms of species and genera, he is doing this solely on pragmatic grounds.

## EXPLANATION AND NATURE IN *ENNEADS* VI.7.1–15

Sara L. Rappe

*Ennead* VI.7, ‘How the Multitude of Forms Came into Being and On the Good,’ opens with a criticism of Plato’s account of Demiurgic creation in the *Timaeus*. Under direct fire is language that describes the Craftsman as calculating, planning, or entertaining reasons for his act of production.<sup>1</sup> What is the philosophical context for this exegesis? Our treatise’s structure is guided by a series of six *aporiae*, each concerned with a Platonic text frequently adverted to within the tradition.<sup>2</sup> Yet the same denial of discursive thought to God is found in several other treatises, viz. ‘On Providence,’ ‘On Problems Concerning the Soul,’ and in the *Großschrift*,<sup>3</sup> all of which are non-Platonic contexts.

Because of the very similar language employed in a parallel passage in II.9, ‘Against the Gnostics,’ most scholars agree that our passage alludes to the gnostic interpretation of Plato’s Demiurge as the planning mind (*nous dianoumenos*)<sup>4</sup> and to the Gnostic idea that Thought, unaccountably hypostatized, planned and carried out the work of creation—*albeit* faultily. More recent scholarship views the denial of discursive thought to the Demiurge as an attack upon the Stoic view of deity which identified human reason and divine intelligence, and holds that in this Plotinus was informed by earlier Academic criticisms of such anthropomorphism. Here III.2 is adduced.<sup>5</sup> To be sure, there continued a longstanding debate in the annals of Ancient Greek philosophy over the question as to whether God thinks the way we think, and Aristotle’s negative answer was definitive for the later Platonists.<sup>6</sup> However, in VI.7 itself, within the chapters that immediately follow the criticism of *Timaeus*, Plotinus refers neither to the Gnostics nor to the Stoics, but rather to Aristotelian teleological explanations of the kind adumbrated at *Physics* II, 199b34, and *Partibus animalium* 1641b25, as well as to the Aristotelian account of definition in *Metaphysics* Z.3.

In this paper I want to discuss the doctrine in terms of Plotinus’ own philosophical methodology,<sup>7</sup> since source criticism has yielded such a

plethora of interpretations. Within our treatise, this doctrine is tied to a discussion of the limits of philosophical explanation: Even though we may *describe* it by means of discursive thought, there is no such thing as a unique explanation for the structure of the world. A good statement of this position may be found in V.8, 'On the Intelligible Beauty.' The explanations by which we humans try to account for world, using discursive thought as we must, are always underdetermined by the available evidence:

You can explain the reason why the earth is in the middle and round, but it is not because you can do this that things are so There; they were not planned like this because it was *necessary* for them to be like this, but because all things There are disposed as they are, the things here are well disposed, as if the conclusion was there before the syllogism which showed the cause, and the conclusion did not follow from the premises. (V.8.7: Armstrong translation)

The word that Armstrong translates as 'reason' is *aitia*. In Aristotle's *Posterior Analytics* it bears the meaning of 'explanation.' According to Aristotle, "if we come to know the 'reason,' we know both the reason for a given state of affairs and that, on account of the reason, it is not possible for the state of affairs to be otherwise. Such knowledge is said to constitute knowledge in its most proper sense. But things could not be more different with Plotinus. For him, the condition *sine qua non* for knowledge is the unity of the knower and the object of knowledge, a condition which discursive thought of any kind necessarily precludes."

Our blue-prints for the world don't correspond to the architect's, because there simply is no discursive thought in intellect. Plotinus offers this critique in keeping with the caveat that Plato himself issues concerning the limits of philosophical explanation:

One should distinguish between an image and its model in terms of the accounts given of them, since the account must resemble its subject matter. The account which describes something stable and evident to the intellect is itself reliable—insofar as words can be not subject to refutation, one must add this qualification—but the account of that which imitates the latter is analogously [deficient].'

By invoking the Platonic being/becoming dichotomy, Plotinus underscores the radical deficiencies of our cognitive powers when we try to look at phenomena apart from their source in the intelligible. Perhaps

the modern concept of *metaphysical realism* can help us to get a handle on just where the difficulty lies with such explanations:

What makes the metaphysical realist a metaphysical realist is his belief that there is somewhere 'one true theory'. In company with a correspondence theory of truth, this belief in one true theory requires a ready-made world: the world itself has to have a 'built-in' structure since otherwise theories with different structures might correctly 'copy' the world (from different perspectives) and truth would lose its absolute (non-perspectival) character."

If by 'world' we mean, in keeping with the Platonic distinction just cited, the totality of phenomenal appearances as opposed to intelligible objects, then this can hardly be something which comes to us 'ready-made'.<sup>14</sup> Now causal relations are a prime instance of what is meant by a 'ready-made structure'. And Plotinus declines to discuss the structure of nature in terms of standard causal explanations, including teleology, one-directional causal connection, essentialism, and metaphysical dualism, all of which are characterized in various ways by the limitations of discursive thought. When Plotinus refuses to subscribe to such explanations, it is because he denies that discursive thought can ever be absolute.

To put it another way, Plotinus' degrees of reality theory has consequences for the way in which causation is understood within different levels of reality. His understanding of the relationship that exists between effect and cause is expressed differently for the physical order than for the intelligible, and again for the first hypostasis. Rather than either the metaphysical realism defined above or the perspectivism that it seeks to combat, Plotinus' view of causation as it relates to the multiple levels of Being could better be described as non-dualism. He sees all of the multiple states of existence as belonging to an integral but unique principle (the One).

We turn now to the critique of causal explanations offered in treatise VI.7. His arguments seem to cut in two directions. Plotinus corrects Platonic teleology with a healthy dose of what is ostensibly Aristotelian essentialism. But this essentialism is in turn modified beyond anything recognizably Aristotelian when Plotinus insists upon the unity of substance (*ousia*) with the second hypostasis, Intellect (*nous*). Aristotle's theory of explanation according to which 'what a thing is' (*to ti ên einai*) is identical to the reason for its existence (*to dia ti*)<sup>15</sup> shows up in chapter 2 as a corrective to the idea that the teleological disposition of the world is imposed from outside.<sup>16</sup> In fact there really is no teleological disposition

of the universe, since the world is well-disposed simply because it subsists together with its intelligible cause." The identity of substance with its essence means for Plotinus that substances, once we understand them in terms of their essence, are self-explanatory, and do not have any external reasons for their being. At the same time, this Aristotelian account of substance (*ousia*) in terms of essence is stretched beyond its original metaphysical framework, because each of these same substances or forms is the whole of the second hypostasis, Intellect. So we cannot explain the world by appealing to the discrete essences of hylomorphic compounds anymore than we can be appealing to the demiurgic imitation of the Forms. It is not the case that the intelligible is only to be discovered in the sensible particular, or that the sensible particular is the teleological goal of the intelligible. Rather, we must go to the intelligible and see how the particular looks from that point of view.

Plotinus replaces or enhances these causal theories with the concept of *coordinate arising*. This doctrine presents a two-fold analysis of the phenomenal world, both parts of which are intended to break up any belief in an independently real or self-subsistent external world. The first theme is a description of the world as an *interdependent nexus of beings*. Under this description, the familiar Stoic idea of *cosmic harmony*<sup>2</sup> receives a more profound philosophical interpretation as a system of relationships which can be described as mutually reflective points of view. The second theme treats the multiplicity of individuals more on the analogy of thoughts arising in the mind, each expressing the nature of the thinker who has them.

Under the first theme, Plotinus uses the concept of *coordinate origination* in order to analyze individuals. Individuals are interrelated to each other with respect to their mutual subsistence within the world and with respect to the kinds of beings that they are. What it means to be an individual is to be an entity that is entirely relational, or to put it negatively, there is no what-it-is-to-be for an individual,<sup>3</sup> apart from the fact that it is interrelated to all other beings and that it represents this reciprocal origination from a certain point of view. Moreover, it is just this inherently relative nature which effectively blocks any adequate discursive account of the sensible world.

The second part of the analysis views individuation as a function of intellect together with soul, whose discursive thinking results in the differentiated world of discrete essences. Therefore Plotinus does not exactly revert to a Platonic model of formal causation, where the form is considered as an entirely separate entity which somehow causes the

particulars. Rather he reframes the whole image-archetype dynamic and emphasizes the nature of image as a function of the archetype.<sup>4</sup> Thus the separation of cause (form) and effect (particular) is subject to criticism, and the whole of the phenomenal world is examined as a function of the intelligible.<sup>5</sup>

### 1. Theories of Explanation in VI.7.1&2.

The treatise begins with an attempt to understand why the individual has been endowed with the faculties of sensation: "God or a god send souls into genesis, endowed with sense organs." But why was this provision made? Answer: for the sake of preservation, which is to be accomplished by the activities of pursuit and avoidance (of sense objects). Plotinus follows a strictly teleological model of explanation to what he considers an absurd conclusion:

God endowed living beings with sense organs out of foreknowledge, that this would tend toward their bodily preservation. Since perception is a function of the soul and not the body, souls must possess some faculty for sense perception even before entering the world of genesis. Otherwise they would lack psychic faculties which constitute part of the definition of soul. Hence the conclusion must be that souls are endowed with the sense capacities by nature. The purely noetic or intellectual condition of the soul would therefore be unnatural for the soul. So the nature of the soul is to exist in a state wherein the sense faculties may be used, and so it must live in the sense world. The soul is designed by nature, then, to exist in a state of embodiment, multiplicity, and in general evil. But if the same intelligence responsible for the creation of the soul could be responsible for its being endowed with the ability for self-preservation, we would have contradictory purposes in the very creation of the soul: "The exercise of providence would amount to no more than the purpose, that the soul be preserved in evil."

The absurdity involves the fact that the Intellect could propose the sensible as an end for its own action. If Intellect is the starting point of deliberation, surely the conclusion will also be intellectual, not perceptible. Hence if deliberation were the mode of thought applicable to the Intellect, then it would not arrive at the sensible as the outcome of the reasoning process. And yet the sensible exists; its cause can only be the intelligible. So the intelligible brings about the sensible in a way that does not involve the production of something outside of itself. The conclusion is that the

sensible already exists within the intelligible. At this stage of the argument, Plotinus does not yet tell us how the sensible exists within the intelligible. He seems to content to exploit a rhetorical trope suggesting the reversal of inner and outer, and to leave the language of the sensible intact as a kind of metaphorical or extended usage.<sup>24</sup>

Thus, after proscribing teleological views, Plotinus proceeds with his own account of the relation between the intelligible and the sensible. The immediate and glaring difference between the type of banned account and the kind of account found at the end of chapter 1 is the manner of reference to time. In the *Timaeus* narrative, events unfold temporally and causation is a developmental sequence that ends in the individual realization (*hekastēn energeian*) of a form within matter. But this kind of analysis is false because of the view that it adopts. It looks at reality as if it were a succession of temporal segments that somehow have to be linked to each other through the explanations we give. Instead of trying to explain things in this way, we should start with the realization that "no 'later' exists in the Intellect" (VI.7.1.40). So when we try to understand reality we should start with a perspective that sees things as simultaneously present.

Several recent studies have called our attention to the Neoplatonists' interest in theories of causation.<sup>25</sup> Of interest to moderns is the outright denial of horizontal or one-directional causal sequence among sensible particulars, or the denial that bodies are causally efficient.<sup>26</sup> Conversely only incorporeal beings such as form, intellect, and soul are agents. The Neoplatonists regularly accounted for the emergence of substances as well as the processes of the natural world by appealing to the idea of *immanent causation*, the doctrine that effects are contained within their causes. Therefore the sensible particular, inasmuch as it is not incorporeal, cannot be designated or isolated as the cause of a given individual or event. In the following passage, we see the denial of something that could be likened to a modern notion of causal relationships, which are very often thought to be capable of expression by means of counterfactual conditions. If event A precedes another event B, such that B would not have come about without the presence of A, then A is said to be the cause of B. In the following passage it appears that, although this counterfactual condition obtains, nevertheless the two events are said not to be causally linked.

Fire does not arise without a cause—What is its cause? Not friction, as one might assume, since fire already exists in the universe and friction takes place with the bodies undergoing friction [already] containing [fire].<sup>27</sup>

Here event A, the friction, is not the cause of event B, the conflagration. Rather, the cause of the conflagration is just the fact that the element fire exists, and presumably, does so in dependence upon the form. This appears to be a denial of horizontal causation. Yet in other places, Plotinus seems more concerned not to deny horizontal causal sequences but rather to illustrate the difficulties involved in trying to specify just how events are supposed to be related to each other if one is to say that they are causally related.<sup>28</sup> One very basic issue involves the difficulty of picking out just what a cause is, such that it is both necessary and sufficient for the bringing about of a given effect. The problem has to do with being able to distinguish such a unique cause from what might be called the total causal field—in being able to distinguish a background condition from a cause. Hillary Putnam for instance illustrates the problem in this way

Imagine that Venusians land on earth and observe a forest fire. One of them says, 'I know what caused that—the atmosphere of the darned planet is saturated with oxygen'... What is and what is not a 'cause' or 'explanation' depends on background knowledge and our reason for asking the question.<sup>29</sup>

The problem here arises from the ambivalent context in which the explanation is given, but we can generalize from this example. If for any given query we find that a complete answer will have to specify all of the relevant background conditions, then it seems that our answer will be reduced to something that does not look like an explanation for the event at all. Plotinus has this in mind when he asserts that the only real explanation for an event is to say that it belongs to a totality.<sup>30</sup> The theoretical background for this kind of problem is sketched at VI.7.2.35, in what I will refer to as Plotinus' doctrine of simultaneous arising:

In fact just as in our universe which subsists from a multiplicity of elements all things are linked with each other, and the explanation for the individual consists in its being a member of the totality (that is, just as the part in the case of every individual is perceived in terms of its relation to the whole), it is not the case that first one thing arises, and then after that, this, but rather things subsist in relation to each other, both the cause and the effect.<sup>31</sup>

We can break this passage into three supporting theses and a conclusion:

(1) *All things co-originate with one another.* This thesis does not simply mean that each thing co-originate with at least some other thing; it is more

likely to mean that all things co-originate with all other things. This universal reciprocal dependence is suggested by the preposition *syn* as well as the reflexive pronoun. (2) *The reason for the existence of each thing consists in its membership within a totality.* And (3) *In the case of each individual, the part is seen to exist in relation to the whole.* This phrase should not simply be translated as 'the part is related to the whole,' since here *echon* is equivalent to the copula and denotes a state of being. Thus the idea is 'a part is within the category of relation to'—i.e. individuals are not substances, but relative entities that do not exist in themselves. Hence, (4a) (Conclusion) *It is not the case that first one thing comes to be, and next another comes into existence after this* [and dependent upon it?].

The first part of the conclusion seems to sketch and then to deny a theory of causation which could easily be compared to the Humean account of cause as:

An object precedent and contiguous to another, and so united with it in the imagination, that the idea of the one determines the mind to form the idea of the other."

Obviously things do arise one after the next. What this phrase (4a) in the text must mean then, is that although there may be sequences of events, these sequences are not causal sequences. The next part of the sentence presents an alternative causal theory: (4b) *The cause and the effect come to be simultaneously in relation to each other.* This alternative, non-teleological method of explanation, in which the relationship between cause and effect is one of co-arising, shows up in the subsequent puzzles of VI.7.1–15: In VI.7.1 it appears to be the inspiration behind the constant refrain in which the logic of temporal succession—*tode meta tode*"—is denied. Rather, the sensible arises as an immediate and necessary expression of the intelligible. In chapter 2 this conclusion is generalized as a corollary of the theory of explanation present in lines 32–35, examined above: The cause must include its effects within itself. Chapter 3 applies this theory to an analysis of soul and concludes that soul must arise simultaneously with its sense faculties. Chapters 8 and 9 show that the objects of sense, and so the whole realm of sentient beings must arise simultaneously from the intelligible world. In chapter 10 all sentient beings must arise simultaneously, as must the gross elements together with their inhabitants (chapter 12).

## 2. Simultaneous Arising within the Larger Scope of Plotinus' Metaphysics

In order to assess the significance of this causal theory, we have to ask whether it is an *ad hoc* solution to the problems of interpretation that beset Plotinus in VI.7, or whether it is a consistent statement of his philosophical orientation. I believe that Plotinus included the doctrine of simultaneous arising as a key concept within the larger framework of his metaphysical system, and that he presented this doctrine as such. The most explicit statement concerning its centrality is found in VI.4, to which we now briefly turn.

Plotinus frequently employs an image consisting in the simple model of a center surrounded by one or more concentric circles, with radii projecting from the center to the circumference of these circles. The terminal points of the radii form the circumference of the circles and the lines described by the radii fill up the surface of the circles surrounding the center. The diagram serves to represent the hypostatic view of reality, with the One symbolized by the center, and each of the circles standing respectively for Intellect and Soul

For the sake of clarity, often the argument wishes to lead to a conception of the multiplicity which has come to be, by positing many lines from one center."

Moreover, he uses the diagram in order to illustrate the causal structure of his entire metaphysical system. Briefly the parts of the diagram refer to a transcendent source (the center in isolation), an immanent source (the center to which the radii are connected) which unifies a multiplicity with which it is identical (the circle considered as the terminus points of the radii), and the individuals which arise simultaneously as members of this unified multiplicity (the radii which fill up the surface area of the circle).

This ontological schema," the interrelationship of all three hypostases, demonstrates the interdependence of all of the aspects of reality upon all of the other parts. Each aspect of the diagram is necessary for and implies the existence of all of the other parts. It is this simultaneous co-presence of the three hypostases of being within the real which fully captures Plotinus' vision, in which the hypostases of soul, intellect, and pure unity, are necessary moments within the integral but unique reality.

The introductory line in chapter 5 gives us an important piece of information about the significance of this model. The model is designed to illustrate the Platonic doctrine of exemplarism or the theory of forms. Plotinus is using a geometric schema in order to illustrate the relationship existing between a form and its phenomenal expression. He states explicitly that this model serves as an illustration for the relationship between intelligible and particular in lines 21–23 of this chapter:

The lines provide us, in this instance, with an analogy for those elements through which the intelligible nature, coming into contact with them, appears to be present to a multiplicity, as a multiplicity.<sup>4</sup>

Considering the diagram as a whole, Plotinus tells us to envision the lines, not as distinct rays, but rather as one surface: All the lines entirely fill up the space delimited by the circle. The unified comprehension of these distinct rays illustrates the relationship of phenomenal particulars, whose individuation is the condition of their multiplicity, with the unity of their own order. The lines arise simultaneously and comprise one totality, they cannot really subsist as realities distinct from each other.

But one must bear in mind when one says this that the things which are said to become many are all together at once, just as there in the example of the circle one cannot take the lines as being separated: for it is one surface.<sup>5</sup>

It is because the individual arises as an integral condition of the totality that the order of individuals must be comprehended as a whole: no amount of discursive thought could succeed in tracing the innumerable relationships that the individual has with other things.<sup>6</sup> Thus we are told that individuals are not self-standing, but exist in ontological dependence within a community of finite entities: "All other things [apart from the One] when isolated are not self-subsistent."<sup>7</sup>

Among later Neoplatonists this analysis of the individual, in which paradigmatic causation by one form, *pace* Aristotle, is replaced by the concept of mutual coproduction<sup>8</sup> became standard. A. C. Lloyd<sup>9</sup> quotes Proclus' *Commentary on Parmenides* as an illustration:

If one is to name one cause, then the order of the universe; or if one is to name several, the movement of heavens, particular types of nature, the properties of the seasons, climates, as well as those who superintend all these. (825, 13–17: Lloyd translation)

One way of comprehending the universe is to look at the entire network of individual components at any given time within the course of its development. This community of individuals, each producing an effect as a result of its interaction with others, is just the world of space and time, the place "from whence what is done is already an effect." Plotinus describes this interconnected community of action in III.2.6 as follows:

Everything does not produce an identical effect when it interacts with everything, but it produces a different effect in relation to a different thing.<sup>10</sup>

Here the individual events take their rise in relationship to other things; they have no fixed character in themselves, but are entirely determined as relative entities.

Plotinus elaborates upon the relative character of the individual viewpoint by means of spatial symbolism, in treatise III.2.7, the end of his work 'On Providence,' in an image which encapsulates the entire teaching on this subject. The outer circumference of our circle is shown in this image as the extremities of branches stemming from a trunk, itself a projection of the central root. Here is what Plotinus has to say about the twigs:

The empty spaces between the branches are filled from the [parts] that [stem] from the root which grow in a different manner, from whence the twigs on the branches are affected as well, as though imagining that the experience comes only from the immediate environment [sc. and not ultimately from the root].<sup>11</sup>

The individual viewpoint is shown as relative here in several ways: The twig, as an extremity of a branch connecting it to the root, really is not an individual at all, but belongs to one organism, and has no existence of its own apart from that organism. Secondly, what it experiences as another organism interacting with it or affecting it, is in fact not another organism at all.

### 3. Individuals and Explanation in VI.7

In chapter 3, Plotinus applies his theory of interdependent causation to the analysis of the human form: If we ask, why does man have eyes or eyebrows, the only answer can be in order that all things might come to be

(*hina panta*). Why should this kind of answer constitute any kind of an explanation at all? Taking the example of eyes first, we can see that Aristotle would certainly find this answer unsatisfactory. Since it is a part of human nature to be a sighted being, we have eyes because they are components without which the human form would be incomplete. Aristotle describes this preferred type of explanation as follows:

This is why we should for preference say (a) that man has these parts because this is what it is for a man to be. For without these parts he cannot be. Failing that, the next nearest thing: that is either (a') that it is altogether impossible otherwise, or at any rate (b) that it is good this way."

At this point we can see difficulty emerging in the view which is explored in chapter 2 of VI.7. There, we read that each being has its reason why within itself, and that on a secondary level (in the order of individuals) the form is the cause of each individual's coming to be. Such a concession would seem to be completely in agreement with what Aristotle says here about the preferred form of natural explanation. Yet in this treatise Plotinus asserts that the reason why human beings have eyes is in order that everything may come to be (*dia ti oûn ophthalmoi: hina panta*). Plotinus has not merely substituted the externally imposed teleology of the *Timaeus* which analyzes the constituent parts of the human form as in some sense instrumental to its good, with the Aristotelian teleology of natural kinds in which parts are described as directed toward the functioning of the mature organism. Rather, he seems to be assuming that the world order will tend toward a maximally rich and heterogeneous composition from among its members."

The use of the word *panta* is a bit confusing in our passage. In chapter 2 it refers to the completion of the form as self-explanatory; in chapter 3 it is also used for the complete realization of a given form within matter. Completion in this sense can be applied to an individual that lacks no part contained within the formal definition of its nature. But he also uses the word 'complete' as part of his denial of teleology, as when he says that the "form means possessing everything"—meaning that the intelligible must contain the sensible within itself. In keeping with this latter usage, if the form (e.g.) of human beings is complete then this completion entails the capacity for sensation (line 27). The simultaneous origination of the physical from the intelligible goes against the strict dualism of Platonic two-worlds metaphysics<sup>26</sup> without embracing Aristotelianhylomorphism. It is within this context that Plotinus says:

"These perceptions here are dim intellections, but the intellections there are clear sense-perceptions."<sup>27</sup>

It becomes clear that a specifically Aristotelian doctrine of nature as principle of change is what is rejected by Plotinus.<sup>28</sup> That natural processes are directed toward the realization of form in matter and toward the most complete development of an individual substance is, according to the doctrine of the pre-existence of the sensible within the intelligible, an inadequate explanation of genesis as a whole. The actualization of form in matter cannot be the goal by which we can account for the specific structure of an organism, because form cannot in fact be actualized in matter. When the form comes to be in a material substrate, it exists in an incomplete state. The specific differentia are compensatory accretions due to the inherent deficiency of embodied individuality:

For, as the powers [of the intelligible world] unfold themselves, they constantly leave behind [something of themselves] above. They proceed by losing something and in the various losses each power finds something else to add on as a result of the deficiency of the living being that appeared as a result of the loss."

In fact, Plotinus goes on to suggest in this treatise that not only is the essence/accident distinction invalid, but it is so because the very differentia which are said in Aristotelian parlance to constitute the definition of something, and so to constitute its essence, are in fact inessential, or strictly accidental for that substance. In this section, Plotinus pursues his attack upon essentialism by means of a favorite strategy. He attempts to pry apart the essence/accident distinction by showing that it has no explanatory power, and thus that the individual substance lacks essential properties.

Aristotle seems to have thought that the concept of hypothetical necessity could be applied to the parts of an organism,<sup>29</sup> so that there were "features of a kind that explain other features of that kind without themselves being explained by features of that kind."<sup>30</sup> If we say that it is part of the human essence to be a sighted being, then eyebrows will be necessitated given this essential structure. So in this case we should be able to designate the eyebrows as 'protective' (*phylaktikon*) and so as something which contributes to the end but is in fact not the end. But then the reason for the eyebrows, the form of man, must exist before—although clearly not temporally since Intellect lives an atemporal life—the safeguard, since it determines that there be a safeguard. Plotinus

concludes that the safeguard is not after all contributory to the essence, but is a part of the essence.

One part of an individual cannot explain another part; parts must arise simultaneously. Thus it is extremely difficult to come up with a functional analysis of the parts of an individual in such a way that one could specify which elements function for the sake of others: "One could say that all that belongs to an individual is its reason why."<sup>24</sup> The collapse of the concept of definitional necessity is based upon the rejection of the distinction between the parts of an individual which are components of the essence, and the parts of the individual which are contributory toward the essence.

This is not to say that the Neoplatonists rejected Aristotelian logic as incapable of yielding valid results for the reasoning process. Rather, the results obtained by this process will not yield necessary propositions about the reality which they describe." As Lloyd points out in his well-known article, the Neoplatonists "are, as it were, assuming that all syllogisms are [only] dialectical [not demonstrative]." In V.8.7, 41 we read:

As if the conclusion was there before the syllogism which showed the cause, and the conclusion did not follow from the premises; [the world order] is not the result of following out a train of logical consequences and purposive thought; it is before consequential and discursive thinking.

The doctrine of dependent origination coincides with Plotinus' assessment of the individual not only as lacking an essence, but as a construction of the discursive reasoning process trying to grasp the intelligible object. Plotinus explicitly tells us that individuation is due to the way that the discursive thought encounters the intelligible object:

When the process of rational thinking separates the distinctive individuality in these realities, not taking it away from the intelligible world but rather grasping it and producing something else, it produces the qualitative as a kind of part of substance, grasping what appears on the surface of reality."

This passage tells us that the individual is not something that exists in the intelligible order (*ouk ekei then*), but is the creation of discursive thought when it simply grasps the surface presentation of the reality (*labōn to epipolēs phanen*). The individual viewpoint, while adequate for ordinary discourse, is only the mental reflection of the sensible world, and is not

adequate for the practice of philosophical understanding or training. In fact, the individual is not a real being, but only what Plotinus calls a pseudo-substance, an appearance that lacks any self-subsistence. Thus in terms of discourse, as the subject of statements, the world of individuals is a system of place holders, or representations, which exist and are defined only as predicated by other such place holders, having entirely relative meaning and reference."

#### 4. Intellect and Explanation in VI.7

Plotinus in VI.7.2 describes the physical world as a mutually conditioning and conditioned causal nexus, which contrasts with his understanding of the intelligible world. In the physical domain, cause and caused are simply correlatives, so that any given thing, having an infinite number of relationships with other things, is an entirely relative entity. However, an idea, far from being related to an infinite plurality of individuals, has its cause within itself. It is causally independent, to the extent that Plotinus can say about the intelligibles at VI.7.2, 40 that each "contains the cause within itself" (*anaitiōs tēn aitian echein*).

By itself, this formula 'containing the cause within itself' specifically recalls *Posterior Analytics* b2, 90a15—to which Plotinus alludes at line 13—but also more generally the identity of substance and essence at *Metaphysics* Z.7. Indeed, Plotinus makes this doctrine the starting point of his discussion of the formula at VI.7.2, 17. The discussion begins with the familiar notion of the convergence of formal and final causes: "What each thing is, is the reason why it comes to be" (VI.7.2, 16). But Plotinus does not confine himself to the case of an individual substance and its essential form: Not only is it true that for each substance, the form (*eidos*) is the cause (*aition*); he means that for each form there is a 'reason why' inherent in it:

Not that the form is the reason for the individual's being—although this is certainly true—but rather if you unfold each form back on itself, you will discover its reason why within it."

'Unfolding the form back upon itself' involves referring each form to the second hypostasis as a whole. Since Intellect (*nous*) is all of the things in it, each of the forms contains the cause of existence in itself, and Intellect, consequently, contains the reason why of all of the ideas in it.

Plotinus clearly uses the formula 'having its cause in itself' to suggest not that each of the forms fits into a system of which it is an essential member," but rather that each form is the whole of Intellect due to the unity of knower and known at the level of the second hypostasis. So Plotinus contrasts the relationship of form to Intellect with that of part to whole in order to demonstrate that the structure of intellect is not fully comprehended through the discursive analysis which depends solely on the logic of essences.

At VI.7.9 we can see directly how the unity of subject and object are at the heart of Plotinus' views on the nature of essence and necessity. Chapter 9 takes up the problem of how the *logoi* of irrational animals can be present in the Intellectual cosmos (*kosmos noētos*). Here we have only what Plotinus reveals to be a pseudo-problem, since there can be nothing unintelligent in intellect itself, which is the source of the *logoi* for irrational animals. The unintelligent within intellect turns out to be intelligent, since both the thinker of the irrational form is intellect, and its thought is intellect. The consequence of this unity is not the improbable one that irrational beings are rational within intellect, but that the rational/irrational distinction simply is not applicable at all. Rational thought does not exist in intellect, so how could it belong to any of the beings in intellect? Now if thought could be different from its object, then the object could be thoughtless. But in intellect, the thinker will be the same as the that of which the thinker thinks. But since thought and object are one, thought can only be a thought of that which is itself intelligent.

In the case of the human self, it will turn out that Plotinus' critique of essentialism extends to the Aristotelian identification of substance (*ousia*) with the soul. In fact, the human soul, containing the *logoi* of all sentient beings, is potentially any one of them: "It exchanges [its body] for the body of an animal. Thus it is incredible that the soul could be the definition of the human being." Since every soul contains the ideas of all living beings, it actually is accidental as to which *logos* a particular soul will exhibit as its essential type in an embodied state. Plotinus objects to defining substances by means of differentiae which are only applicable to embodied beings.

Plotinus elsewhere discusses the question of whether we can define the soul *per genus et differentiam*, as living being, where soul belongs to the genus 'living' and is defined by the differentia 'living'.

Is then being one thing, and the rest something else, which contributes to the completion of the substance of the soul, and is there being [as such] and an essential difference makes the soul?"

Lloyd discusses the strategy for Plotinus' criticism of the definition of soul *per genus et differentiam* as living being:

Soul is an *ousia* [substance], but its being is distinct from generic being. It cannot be being plus a differentia added to it from outside this generic being; otherwise it would be an essence or substance in respect of only half of its essence, viz. the generic half of its definition."

The point is that for the Aristotelian definition, we must find a differentia outside of the category of the genus. But in this case the genus is Being, so to find a differentia outside of Being, would, according to Plotinus, necessitate that soul be less than substance in half (the differentia) of its definition. Lloyd gives this example in an attempt to show that the Neoplatonists deny the validity of Aristotelian essentialism by showing that there can be no necessary connection between the two parts of a definition, a problem about which Aristotle himself was certainly exercised. But if there is no necessary connection between the two parts of a definition, it is no longer possible to draw the distinction between accidental and essential.

This argument is an example of an across the board rejection of this kind of definition for any species: Since any species form is a *substance*, to say that the specific differentia falls into a different category, is to say that only one half of its definition is in fact substantial; the differentia would be by definition accidental. Plotinus goes on to tell us that the soul, if it is substance and not accident, must not obtain its differentia from outside of the category of substance (VI.2.5, 26).

To what does the definition of man refer? Not to the embodied individual, since its matter does not enter into the definition, but not to the idea either: The intelligible form is not susceptible say, to being defined as rational as opposed to irrational, since intellect is pre-rational. Intellect is universal; it cannot belong to any individual. But if there is to be any knowledge of the individual then an appeal must be made to its definition, or to that about it which is universal. We have to refer the sensible back to the intelligible, but in the intelligible, each form is Intellect, and Intellect is all forms. Therefore, in order to have knowledge of the individual, we must have knowledge of the intelligible, but to have this knowledge is to understand the unity of Being. We must therefore rethink the nature of the

individual, and see that individuals are not separate substances, but aspects of the one universal being.

### 5. Explanation and Contemplation in VI.7

In order to show the connection between theoretical underpinnings and contemplative praxis, let us briefly glance at the two meditations that follow upon the exploration of teleology and paradigmaticism in chapters VI.7.1–11. One is macrocosmic, the other microcosmic. In the first vision, Plotinus contrasts the universal living being of the *Timaeus*, exemplar of the world of particulars, with this universe ("this all exists in relation to the paradigm of that intelligible world"—VI.7.12, 1):

Since we maintain that this all exists after the pattern (so to call it) of that, *the universal living being must exist there too first, and, if its existence is to be complete, must be all living beings.* And certainly the sky there must be a living being, and so a sky not bare of stars, as we call them here below, and this is what being sky is. But obviously there is earth there also, not barren, but much more full of life, and all animals are in it, all that walk on and belong to the land here below, and obviously, plants rooted in life; and sea is there and all water in abiding flow and life, and all the living beings in water, and the nature of air is part of the universe there, and aerial living things are there just as air itself is...*For as each of the great parts of the universe is there, so is of necessity the nature of the living beings in them.* (Armstrong translation)<sup>4</sup>

This passage reflects the two-fold analysis of individuation, that of reciprocal origination, and that of the direct expression of the intelligible source in the individual. These two aspects of the meditation are explained by the fact that one facet, the interconnection of all beings, is used as a support for the more direct experience of unity which follows. On the one hand, the vision consists in perceiving the relationship between part and whole, as flowing reciprocally between the two terms of the hierarchy; but it ends, on the other hand, in a complete fusion between the sensible and intelligible, as well as a detachment from individuality, an experience of the unification of the phenomenal world in which the distinction between essence and accident, between body and mind, between any individuals, is no longer present.

This meditation is an introduction to the experience of intellect as the unifying ground of all individuated existence. By shifting the focus from a teleological account of discrete essences to a systematic account of individuals as interrelated, Plotinus hopes to effect a change in the kind of analysis we give of individuals. What counts as an adequate understanding of individuals? The physical aspect of living beings, by means of which they express their individuality, must be seen as a unity, objectively, as constituting one world body, and subjectively, as constituting one phenomenal presentation. What happens in the next step of the meditation is that the qualities that are known to comprise, on the Neoplatonist's account, the sum reality of the individual,<sup>5</sup> are no longer capable of doing the work of presenting attributes by which an individual might be discriminated from another individual. Instead, the qualities are apprehended in the most general form as one unified field of sense presentations, and it is the consciousness of the apprehender to which these presentations belong:

They all flow, in a way, from a single spring, not like one particular breath or one warmth, but as if there was one quality which held and kept intact all the qualities in itself, of sweetness along with fragrance, and was at once the quality of wine and the characters of all tastes, the sights of colours and all the awarenesses of touch. (Armstrong translation)<sup>6</sup>

Thus the progress of the passage is from the objective description of the quality, as sweetness or smell, to its fundamental nature as a kind of awareness on the part of the perceiver.

In chapter 15 we have another vision in which Plotinus seems to be describing an experience which he may have had of the unity of intellect:

So that if one were to compare it to a living, variegated sphere, imagining it either as an entity that consisted entirely in aspect, illuminating by means of its living aspects, or as all detached souls running together into identity, one would not be amiss.<sup>7</sup>

Each individual is no more nor less than a point of view, an aspect, an act of vision. Individuals, as part of the objective order, are intrinsically without their own nature. Thus the sphere is described as consisting entirely of aspect, being mere appearance. At the same time, when the knower succeeds in becoming detached from the objective order of reality—from its *procession* (*prosopon*), as it were—then these same

appearances are seen within the context of a unity which is very difficult to define or communicate, without implicitly severing the unity which is the foundation of the vision. Therefore the meditation ends with an exhortation to 'make oneself the vision.' The reversal in cognition occurs together with the reversal in self-identity. This unity is only apprehended when discursive thought, responsible for the whole order of individuation, is set aside.

Plotinus finishes his study of nature in treatise VI.7 by offering a contemplative vision rooted in the theoretical position he has outlined in the preceding first chapters. Does the doctrine of dependent origination express Plotinus' philosophical originality and does it differ in any significant way from the well-developed Stoic conception of world harmony that obviously informs it? The fact that Plotinus so carefully distances his own position from that of the Stoics by denying discursive thought to the Demiurge should at least invite the above questions.

It seems that Poseidonius attributes the intelligibility of the world's structure to the fact that the designing intelligence, God, and human intelligence share the same thought processes, since human souls are *apospasmata* of God.<sup>4</sup> Therefore the Stoics hold that a teleological description of the world is a factual description of a state of affairs that inheres within the cosmic structure. But this very structure, the systemic cohesion of individuals within their order of being, is understood by Plotinus as a reflection of the inherence of our world within its intelligible cause. And this latter, the Intellectual cosmos, is not systematic in the way that the physical cosmos is.

In chapter 13 the 'highest kinds' (*megistē genē*) of Plato's *Sophist* appear as a counterpoint to the Stoicizing conception developed in chapter 12. Here the reader encounters an extremely paradoxical aetiology for the complexity of the intelligible world:

All things are varied to the extent that they are simple, and this means to the extent that they are not composites and are activities."

And again in line 55:

There is nothing in it which is not other, so that in its otherness it may contribute this too."

Plotinus is describing the dynamic life of intellect in which the interplay between subject and object creates a proliferation of points of view, the subject discovering itself in the object and the object being

discovered within the subject. The life of intellect, constantly projecting itself as object of its own realization is actually the very life that comprises the world of sentient beings.

World and soul, knower and known, must arise together. Plotinus finishes his examination of the sensible and the intelligible by showing that they are more like two sides of the same coin than two separate realities. The world of action, that world in which production occurs and things come to be, is implied by the very nature of the intelligible world. In much the same way one could say that when someone acts, there exists a relationship between his/her internal state and his/her action, for the latter reveals that internal state. The act, seen mentally in terms of one's intention, could not be intended without the awareness of the possibility of carrying it out, nor could we speak of an actor, apart from his/her intention."

By analogy to the relationship between thinker and act, we can say that the life of the cosmos expresses the content of Intellect. Plotinus is emphatic in his assertion, however, that the cosmos has come to be, exactly as if its author had flawlessly calculated the optimum conditions for its existence. Nevertheless, this way of viewing the rational order inherent within the universal is purely metaphor. The divine intellect does not purposively determine any of the states of the cosmos. All things are at once implied by, as well as realized in, their conception, but what is intended, we might say, is the very conception itself. Hence the universe arises as a simultaneous expression of Being, and all phenomena are mutually interdependent within their respective orders."

The University of Michigan

## NOTES

1. The first lines quote *Timaeus* 45b3, directly alluding to the younger gods' dispatch of the souls into the world of space and time, but the general issue is the language of deliberation that Plato uses in the narrative. Cf. *Timaeus* 30b1, *logisamenos*; 29c1, *pronoian*; 34a9, *logismos*, etc.
2. For general discussions of VI.7. 1-15 in light of Plotinus' philosophical treatment of the idea of *Pronoia*, see Leroux 1990, 31-32; Theiler 1966; Schubert 1968; Hadot 1988, 31-36; Schroeder 1992, 16-20.
3. On the overall structure of VI.7, see Hadot 1987; Hadot 1988.
4. See Harder 3b; Schubert 1968; Leroux 1990; and Wallis 1987.
5. II.9.8, 20. In chapters 5 and 6 Plotinus censures the opponents' falsification of Plato's account of creation: "Often they have soul as the maker instead of the planning mind and they think that this is the maker according to Plato,

- being a long way from knowing who the maker is. And in general they falsify Plato's account of the manner of the making" (II.9.6, 23–26). For a discussion of whose views precisely are being criticized, see Peuch 1960; Roloff 1970, 169–179; and Elsas 1975, in the appendix on Roloff's monograph. II.9 and VI.7 both oppose a literal reading of the *Timaeus* creation account not only because of Gnostic renderings which hypostasize the planning mind, but also because a literal rendering assumes that the world had a beginning in time.
6. The conception of a Demiurge or Creator God who uses the forms as a blueprint for the world is of course central to most Middle Platonic discussions that try to explain how God interacts with the world. See Witt 1930, 199; Dillon 1977, 46–49 & *passim*.
  7. II.9.7
  8. See Wallis 1987, 942–952.
  9. *Metaphysics* A.9 and *De Anima* II. For the Aristotelianized Platonism of the Imperial period, see Blumenthal 1987.
  10. It could be said that Plotinus reversed the terms of the debate and asked whether the human soul could ever think like the Divine mind. For his positive answer to this question in the form of the concept of the undescended soul and its heterodoxy within the Platonist tradition, see Blumenthal 1987.
  11. Throughout the *Enneads* we find the insistence that the world is not an artifact whose genesis is owed to someone's intentions, associated with the 'two acts' theory of causation, wherein every level of reality must of necessity produce an image of itself in the form of a 'lower' existent. However what follows is a methodological interpretation rather than a strictly metaphysical one. For caution against a purely source-critical approach to Plotinus, see Leroux 1990, 23–26.
  12. *Posterior Analytics* I, 71a16: *Epistametha de oiomeih'hekaston haplōs, alla mē ton sophistikon tropon ton kata symbebēkos. hotan tēn aitian oiōmetha ginōskein di' hēn to pragma estin, hoti ekeinou aitia estī, kai mē endechesthai tout' allōs echein.*
  13. See Lloyd 1986; Alfonso 1990.
  14. *Timaeus* 29b3: *hōde oun peri te eikōnos kai peri tou paradeigmatos autēs dioisteon, hās ara tous logous, hōnper eisin exēgēai, toutōn autōn kai syggeneis ontas; tou men oun monimou kai bebaioi kai meta noun kataphanous monimous kai ametaptōous—kath' hoson hoion te kai anelegois prosēkei logois einai kai anikētois, toutou dei mēden elleipein—tous de tou pros ekeino apeikasthentos, ontos de eikōnos eikotas ana logon te ekeinōn ontas.*
  15. Putnam, 211.
  16. Limitations of space prohibit a detailed discussion of this topic, but readers should refer to Wagner 1982 & Lee 1984.
  17. *Physics* 197a32. Cf. *De Generatione Animalium* II, 742b23–36.

18. On Aristotle as a corrector of Platonic notions of teleology, see Balme 1987, 275.
19. Cf. VI.7.3, 9.
20. On Stoic cosmic *harmonia*, see Cicero *De Finibus* III, sections 38 ff; Edelstein-Kidd 1990, fragments 104 and 106. For Plotinus' familiarity with this Stoic tenet, and the probable influence of Poseidonius, see Reinhardt 1924, Graeser 1976, Witt 1930, Theiler 1966.
21. For Platonists of any century, of course, it is simply not true that the individual (the sensible particular, that is) will have an essence at all. As Code (1985) has shown, if *x* is a particular, then there is no *y* such that *y=x* and *y* is essentially predicable of *x*. The sensible cannot have an essence because it simply has no substance, hence it is neither defineable nor knowable. Whereas for Aristotle, although individuals do not have definitions (*Metaphysics* Z.12, 1039a) the essence of the individual is simply the essence of the kind under which it falls.
22. The relationship that Plotinus tends to find most expressive of this kind of causality is the relationship between thinker and thought, or mind and object of consciousness. Since thought and thinker are not two distinct entities, Plotinus treats the individual, not as a separate reality from the intelligible, but rather as an expression of the intelligible. As A. C. Lloyd puts the matter: "In the last analysis, substance and attribute coincide either as substances and their activities or as imperfect projections of such activities" (Lloyd 1990, 91).
23. See Schroeder 1980, 50: "The intelligible world is not merely represented by the things in the world of sense. It is truly present in them." And again on page 52: "In 6.3.15...the entire content of the world of sense is to be conceived as a quality, in the sense that it bears an adjectival relation to the intelligible world..."
24. Thus we find him talking about "the perceptibles that exist there" (VI.7.6, 2); "the eyes they have there" (V.8.4, 26); "*einai tas aisthēseis tautas amydras noēseis, tas de ekei noēseis enargeis aisthēseis*" (VI.7.7, 31: 'Our sensations are dim intellections; intellections are clear sensations').
25. Barnes 1983; Sorabji 1987; Wagner 1982.
26. Barnes 1983, 175, concisely summarizes Proclus' presentation of this view (*Elements of Theology* 80): (1) all bodies are passive; (2) everything incorporeal is active; (3) no body is active; (4) no incorporeal thing is passive. Barnes supplies the conclusion to the argument: Only incorporeal things are active.
27. VI.7.10, 40 (Armstrong's translation modified, reading *echontōn* as a temporal, not causal participle): *ouk ek tou automatou pyr—pothen gar; ou gar paratripsēs, hās an tis oiēkein; ἑδὲ gar ontos en tōi panti pyrōs hē paratripsis echontōn tōi paratribomenōn sōmatōn.*

39. VI.8.15, 25: *ta men oun alla monoumena ouk estin hautois autarkē einai eis to einai*.
40. Cf. Hadot 1988, 203: "C'est dans leur production par l'Espirit, c'est à dire dans leur coproduction mutuelle (6.7.2.37) qu'elles ont leur pourquoi (6.7.2.26–27)."
41. Lloyd 1990, 163.
42. *Ou gar to auto poiei pan proselthon panti, alla to auto pros allo kai allo pros allo*.
43. *ta de diakena hoion tōn kladōn eplēroumio ek tōn au ek tēs hrizēs kai autōn allon tropōn pephykōtōn, ex hōn kai epasche ta akpa tōn kladōn. hōs ek tou plēsion oiesthai to pathos ienai monon*.
44. *De partibus animalium* I, 640 a33–b4.
45. Aristotle does not defend his assumption of the permanence of the world order by means of such a theory (Cooper 1987, 248). But Poseidonius evidently used the same description of the world order (poikilon zōon) that Plotinus uses in VI.7.12. See Witt 1930 & Gracser 1972. In this treatise, we find the concept of maximal diversity expressed in the word poikilon. This idea is elaborated upon at line 9 in chapter 13 of our treatise: *sōma homoiomeres ti kai apoikilon; alla gar ti to semnon* ("What is there worthy of adoration in a homeomerous body, one that lacks variation?"); and again

- at line 25: *physin ara echei epi pan heterousthai* ("It [the living cosmos] tends toward maximal diversity"). See below, section 4, for the relationship of this idea to the Stoics and for its justification in Plotinus.
46. Once more, limitations of space prohibit extended discussion of this non-dual tendency within Plotinus' metaphysics, but readers should consult Wagner (1982) for a detailed discussion on the relationship between Plotinus' philosophy of perception and his two-worlds metaphysics.
47. VI.7.7, 31: *hōste einai tas alsthēseis tautas amydras noēseis, tas de ekei noēseis enargeis aisthēseis*.
48. Cf. the discussion in chapter 2 on the deficiencies of the sensible human particular as opposed to the form of the human being. Plotinus' point here is the denial of Aristotelian teleology, in which the goal of change is the realization of the form in matter, or the coming-to-be of the hylomorphic compound.
49. VI.7.9, 40–41: *echelittomenai gar hai dynamis kataleipousin aei eis to anō. Proinsi de ti aphienai d' alla allai dia to endecs tou zōōu tou phanentos ek tou elleipontos heteron exereusai prostheina*. It is true that Plotinus accepts an Aristotelian hylomorphic description of sensible particulars in the treatises concerned with matter, II.4 and II.5, in the limited sense that he accepts the necessity of a substrate for the sensible which in itself utterly lacks quality or is essentially a deprivation of form (see *Physics* Ia.192a2). "Matter is an outcast of reality and is separated from the perfection of being. As a result it can never unite with form, for how can the unreal add anything to the real? Plotinus' theory of matter reflects a dualism between matter and form and is alien to Aristotelian hylomorphism" (Hancock 1985, 139). For a more reconciliatory account of hylomorphism in II.4, see Corrigan 1981.
50. For a list of Aristotelian passages which apply a teleological analysis to the parts of an individual organism, see Gotthelf 1987, 190–191.
51. Gotthelf 1987, 189.
52. VI.7.2, 44: *panta hosa echei echois an eipeln dioti hekaston*.
53. A great deal of scholarly work has been devoted over the course of the last decade to the exposition of Plotinus' notorious critique of Aristotle's categories, presented in *Enneads* VI.1–3. To name but a few of the major works appearing recently: Lloyd 1955–1956; Lloyd 1990; Wurm 1973; Strange 1981; Rist 1967, chapter 8; Corrigan 1981, 98–121.
54. *Hotan de chōrisē ho logos to ep' autois idion ouk ekeithen uphēlōn, alla mallon lubōn kai gennēsas allo, egennēse poion hoion meros ousias labōn to epipolēs phanen aut'*.
55. The bundle theory of sensible particulars as encountered in Plotinus has been the subject of thorough discussion in the context of Neoplatonic scholarship. Strange (1981) relates the *migma* ('mixture') conception of sensible substance to the analysis of sensible substance into "nothing more than the conjunction of the sensible differentiae" (196). Strange is careful to distinguish this position from a nominalistic account of definition, in which

there is simply a list of attributes that in fact belong to a given class of objects. However, Plotinus does not lose touch with his Platonist roots, nor with the entailment relations that in fact govern which attributes are realized in a given class of objects. One feature of Strange's account with which I disagree, with all respect to his very carefully documented claims concerning treatises VI.1–3, is his conclusion that the intellect must be "a logical structure which somehow contains and makes possible the relationship between the terms of all necessary propositions" (199). Since Plotinus denies that discursive thought exists in the intelligible world, it cannot be a logical system which corresponds to discursive predicates. Since writing this dissertation, Strange seems to have changed his views (see Strange 1987).

56. See also the discussion of the coincidence of formal and final causes at *Physics* II.7, 198a.
57. *Ouch hoti to eidos hekastō aition tou einai—touto men gar alēthes—all' hoti, ei kai auto to eidos hekaston pros auto aavaptyttas, heurēseis en autōi to dia ti.*
58. This is not to deny that there could be a sense in which the Forms are systematically related. But my point is simply that Plotinus is not concerned to specify what such a system might be, or even that this system exists.
59. VI.7.6, 22: *metabolousēs de thērion sōma thaumazetai de, pōs logos ousa anthrōpou.*

## PROVIDENCE: THE PLATONIC DEMIURGE AND HELLENISTIC CAUSALITY

Gary M. Gurtler

Plotinus' discussion of providence and theodicy combines elements from diverse parts of the Greek philosophical tradition. The notion of providence, for example, owes much to the Stoic doctrines of sympathy and seminal reasons, while its actual operation relies on Aristotle's notion of causality. It remains true nonetheless that the context for both of these contributions is the teaching of Plato, especially concerning the role of the Demiurge in the *Timaeus*. The centrality of Plato in this instance, as in many others, is not without its difficulties. Plato, in his usual deliberate way, describes the relation between the world of Forms and the sensible world, and the consequent perfection of that world of nature, in terms of a myth, with the Demiurge having a key but mysterious role. Plotinus' more systematic approach means that he must give an exegesis of this Platonic myth in such a way that it fits coherently into his own metaphysical structures without at the same time doing violence to the Platonic text. His exegesis is indeed a conscious one, aware of the literal meaning of the text and of the principles he is using to interpret it.

Under and within this Platonic superstructure, moreover, Plotinus inserts the contributions of the Stoics and Aristotle with hardly a nod of recognition. They have been assimilated as contributing detailed analyses of particular facets of a reality that remains thoroughly Platonic in its orientation. From Plotinus' point of view they do not need exegesis, though he will at times indicate how they must be changed to fit a Platonic world. They are rather tools ready at hand for his more crucial task of understanding what is often obscure in the text of Plato.<sup>1</sup>

My emphasis will be on four treatises where Plotinus provides either a discussion of demiurgic activity or a direct exegesis of the text of the *Timaeus*, two relatively early (V.1[10] & III.9[13]) and two from late in the middle period of his writing (V.8[31] & VI.7[38]). As indicated above, two different kinds of problems emerge. One is strictly exegetical: how

to make sense of the vocabulary Plato uses to discuss the activities of the Demiurge. The second includes a systematic component: the nature itself of demiurgic activity in relation to the corresponding natures of Intellect, the Hypostasis Soul and the world soul. By looking at these two areas we can begin to see how Plotinus develops a carefully nuanced doctrine of providence and also a philosophical method for its articulation within the Platonic tradition. The particularly neuralgic character of the doctrine of providence presents us, therefore, with a glance at the way Plotinus actually went about philosophizing, the issues he considers crucial and the meaning of the texts he regards as foundational.

It is in the context of the doctrine of providence that Plotinus adumbrates how it is that the intelligible world serves as the archetype of the sensible and, in paradoxical fashion, how our knowledge of the sensible serves as the basis for our knowledge of the intelligible. In this regard, he shows great subtlety in moving from concepts or analogies that have their original meaning in relation to sensible experience to the nature and functioning of these ideas when transferred to the realm of the intelligible. Providence thus can be understood not only as a cosmic ordering principle or theodicy but as a peculiar version of the argument for the existence of God in terms of design.

## 1. The Demiurge and Its Planning

In the two early treatises (V.1[10] & III.9[13]), Plotinus sets out to qualify the two key areas that will allow for the possibility of providence, the nature of the Demiurge itself and the language describing its planning activity. His procedure is similar in both cases, moving from an univocal to an analogical understanding of the areas involved. The Demiurge, for example, is identified in the strictest sense with the Intellectual Principle itself, but to operate in the generation of the sensible world its activities must be spread out to include the Hypostasis Soul and the world soul.<sup>2</sup> In a similar way, Soul's reasoning or planning [*dianoia* or *logismos*] must be carefully distinguished from the discursive mode of human thought from which it gets its name and with which it is analogous. The two moves delineate the intermediate nature and function of the soul, which serves as the ontological link between the intelligible and sensible worlds and thus as the locus where providence operates in the Plotinian system. In the later treatise considered in this part, V.8[31], Plotinus specifies the planning of

the Demiurge by means of a contrast to human artistry, thus completing the groundwork for the major discussion in VI.7[38].

### 1.1 *The Soul as Demiurge*

The first passages, from the treatise 'On the Three Primary Hypostases' (V.1[10]), are taken from the middle of the treatise, omitting the preliminary and final sections about the ascent of the individual soul, which begins with its initial identification with the world soul. In this middle section, Plotinus shifts the analysis to the radically different point of view of the relation of the hypostasis Soul to Intellect and the One, on the one hand, and to the sensible cosmos, on the other. The shift is subtle and not all commentators recognize it, but two mutually supportive factors provide strong evidence for it.<sup>3</sup> First, Plotinus begins to discuss the emanation of Soul from Intellect and, second, there is an implicit recapitulation of the relation of this Soul, as the Hypostasis and source, to the world soul and individual souls as its participants. Two passages in particular specify characteristics of the Soul that make it different from Intellect and thus crucial in determining its demiurgic role. They occur at the beginning and end of this middle section, at VI.1.3 & 7.

But one must understand that the activity on the level of Intellect does not flow out of it, but [remains in itself while] the external activity comes into existence as something distinct. Since then its existence derives from Intellect soul is intellectual, but its intellect is in reasonings [*logismois*], and its perfection comes from Intellect, like a father who brings to maturity a son whom he begat imperfect in comparison with himself. Soul's establishment in reality, then, comes from Intellect and its reason [*logos*] becomes actual in its seeing of Intellect. (V.1.3, 12-15: adapted from Armstrong translation)

There is a good bit of ambiguity in this passage. The closeness of Soul and Intellect is both affirmed and denied. The Soul is like the Intellect as having the same intellectual nature, like a son to a father, but its intellection is described as reasonings and reason and its sonship is of a peculiar kind not maturing to eventual equality of being. The ambiguity is deliberate, with Plotinus indicating the nature of the Soul as on the border of the intelligible and sensible worlds with its own function as the generative mediator between the two. This function of the soul is clearly demiurgic, preserving the transcendence of the Intelligible world and allowing for the generation of the sensible, while at the same time defining

the nature of soul in terms of its own being and knowing. For our purposes, however, the terms used for the soul's knowing present a further problem.

The soul analyzed here is definitely the Hypostasis Soul, but Plotinus uses the terms *logismos* and *logos* to describe its knowing in contrast to the *nous* (intellect) and *noera* (intellectual activity) that characterize Intellect itself. The meaning of these terms comes directly from the discursive character of human reasoning, but such discursiveness is impossible in the case of the Hypostasis Soul, which is completely within the Intelligible world. On the one hand, Plotinus is attempting to convey the demiurgic function of the Soul as the repository of the rational, creative, formative principles (*logoi*) that operate in the generation of the sensible world. On the other hand, as V.1.7 points out, the proper activity of the soul is nonetheless intellectual, with the inferior activities connoted by *logismos* and *logos* actually belonging to an inferior type of soul.

And the offspring of Intellect is a rational form [*logos*] and an existing being [*hypostasis*], that which reasons [*to dianoonumenon*]; it is this which moves round Intellect and is light and trace of Intellect and dependent on it, united to it on one side and so filled with it and enjoying it and sharing in it and thinking [*nooun*], but, on the other side, in touch with the things which came after it, or rather itself generating those things which must necessarily be worse than soul; about these we must speak later. (V.1.7, 42-48: adapted from Armstrong translation)

The problem thus centers on the application of *logos* and *dianoeisthai* to the soul. *Dianoeisthai* adds a crucial word that also carries the connotations of planning and deliberation, modeled on the discursive character of human making. The caveat to a simple and literal interpretation of either of these terms, with their full discursive character to the fore, is once more pressed home by the divided character of the soul. The Soul is lower as a certain *logos* and hypostasis different from Intellect, one which reasons (*to dianoonumenon*), but is so close to Intellect on its higher side as to be filled with it and think (*nooun*), only on its lower side producing things worse than itself. Since Intellect itself is described in this treatise as a *logos* of the One (V.1.6, 45), it is clear that Plotinus is using this term in a technical sense which indicates ontological subordination rather than discursive thought or reason. In addition, the consistent way Plotinus posits the soul's own true activity as intellective, using *nous* and *nooun*, makes sense only if *logismos* and *dianoeisthai* can also mean something other than discursive thought in these passages. More evidence

is needed, however, to confirm this initial reading and to fill out more completely what Plotinus means by it and how he actually understands the analogy between their use with reference to the human soul and to these higher levels of soul.

The second treatise in this early period, the first note of Various Considerations (III. 9[13].1), provides more abundant material for resolving these issues. First of all, it is a specific exegesis of *Timaeus* 39e7-9, particularly concerned with the relation of the Demiurge to Plotinus' own threefold division of reality into the One, Intellect and Soul. Secondly, although only *dianoeisthai* and *dianoia* are used, the same problem emerges of applying this term in its strict discursive sense to either Intellect or Soul as Demiurge.<sup>4</sup> This treatise thus provides a glimpse at Plotinus' exegetical problem, how to make sense of a Platonic passage that seems, at least linguistically, not to fit his own philosophical position.

'Intellect,' Plato says, 'sees the Ideas contained in the living creature which is.' Then the Demiurge, he says, 'planned [*dienoethe*] that this universe too should have the things, which Intellect sees in the living creature which is.' (III.9.1, 1-3: following Igal III-IV, 265)

Plato himself uses *dianoeisthai*, with Plotinus supplying the Demiurge as its subject. Parallel passages (V.1[10].10; IV.4[28].12; II.9[33].6; V.8[31].6-8; VI.7[38].1) contain the same juxtaposition of demiurgic function and planning, each attempting to unravel the seeming contradictions between the description of this function as planning and the ontological nature of Intellect and Soul, which excludes any kind of movement in Plotinus' theory of intellectual knowledge.

In the present passage, therefore, Plotinus first determines whether or not the living creature and Intellect are in fact the same thing, distinct only in thought, stating that there is nothing to prevent this identification from being Plato's intention (III.9.1, 10-15). Nor do the words of Plato rule out the possibility of two Intellects, one the intelligible object which is at rest and the other the Intellect that sees it (III.9.1, 15-22). This exegesis admits openly that the text of Plato supports a number of interpretations, only one of which corresponds to his own and one of which was current in the generation before him. He argues for his own position, the second hypostasis as Demiurge, but combines it with the thesis of two Intellects, the middle Platonic position which he normally rejects, as Igal notes (III-IV, 266 n9), putting his conclusion in these terms:

This, then, is that which planned [*dianoethen*] to make in this universe the four kinds of living creatures which it sees in the intelligible. (III.9.1, 21-22: Armstrong translation)

This, however, raises an *aporia*, that the planning function of the Demiurge is in fact not appropriate for the Intellect, whether in its middle Platonic formulation or his own, so some other alternative must be sought. In a very revealing way, moreover, Plotinus indicates that the text of Plato is in itself of no help, and that the solution comes from principles supplied by the interpreter. Exegesis cannot force the text to say something that it does not, although a good exegete, using principles consistent with a Platonic system, should be able to give a consistent, if not conclusive, interpretation.

It seems, nevertheless, that Plato is trying obscurely to make the planner [*to dianoooumenon*] something other than those two. But to others it will seem that the three are one, the living creature which exists in itself, the intellect, and the planner [*to dianoooumenon*]. Rather, as in many cases, proceeding from different premises, there are different ways of understanding that there are three. (III.9.1, 23-26: following Igal III-IV, 267: Cf. Armstrong III, 409)

The difficulty concerns the activities ascribed to the Intellect on the basis of the passage in the *Timaeus*. The Intellect would not only plan what is to be made in the physical universe, but actually carry out the making and dividing, which are clearly functions inappropriate for its eternal and undivided nature. Thus Plotinus is forced to conclude that there must be a third, other than Intellect and the living creature, which actually does something closer to planning than Intellect can and, more importantly, is able to do the dividing necessary in the generation of the sensible world.

We have already spoken of two, but who is this third, who itself planned [*dienoethe*] to construct and make and divide into parts the things that Intellect sees lying in the living creature? (III.9.1, 27-29: following Igal III-IV, 267)

The nub of the problem is the dividing that is done. The Demiurge makes the four kinds of living things (III.9.1, 22)—heavenly beings, birds, fish, and land animals—and a parallel division into types of soul—gods and men, animals and plants. In a way this division comes from Intellect, but the dividing must be the work of Soul, and especially the world soul, a

position that becomes a commonplace in the later treatises of the *Enneads*. Thus, as in V.1[10], Soul is identified with the Demiurge that planned:

Because of this Plato says that the division belongs to the third and is in the third, because it planned [*dienoethe*], which—the planning [*dianoia*—is not the work of Intellect, but of Soul, which has a divided activity in a divided nature. (III.9.1, 34-37: adapted from Armstrong translation)

Though it is appropriate that Soul be that which plans, the strict sense of *dianoia* as discursive thought must still be guarded against. This is true for both the hypostasis Soul and the world soul. We might say that Soul has a planning-in-itself that precedes the actual division into bodies, which is accomplished by the world soul.<sup>2</sup> The world soul in its planning also does not deliberate in carrying out the division, a point that will be made abundantly clear in VI.7[38].1. Thus the terms Plotinus uses here in III.9[13] and earlier in V.1[10], *logismos* or *dianoia* and their cognates, cannot have the discursive character in the Hypostasis Soul and the world soul that they do in the human soul. Why then are they used? Plotinus wants to distinguish two aspects of soul's being and knowing, in conformity with his theory of two acts: the full intellectual act by which it is identified with the Intellect and that act by which its own identity as soul is revealed in generating the sensible cosmos. This second act gets its name from what it produces, but must still have a nature more compatible with the Intelligible. Another aspect of Plotinus' method is implicit in this instance, that our terminology for describing reality, whether sensible or intelligible, derives from sensible experience, and will need appropriate redefinition when we begin to apply it to the higher realms of Soul and Intellect. The next treatise, V.8[31], from the middle period, provides a more explicit contrast to clarify the difference between sensible and intelligible and to indicate the kind of corrective needed to make the move from knowledge of the sensible world to an understanding of the higher realms of Soul and Intellect.

## 1.2 Planning in the Demiurge and the Human Artist

In V.8[31], the second installment of the long treatise against the Gnostics, Plotinus discusses the nature of beauty and distinguishes two kinds of making, that of nature and that of art. This provides a context in which the deliberative and discursive character of the human artist can be contrasted with the non-discursive and non-deliberative character of nature

in its generation of the sensible world. Plotinus is able in this way to confirm the interpretation of the earlier passages in V.1[10] and III.9[13].1 as not implying the same kind of discursive character that is always present in their use with human knowing. At the same time he is able to describe more fully how he understands the activity of the Hypostasis Soul and the world soul as actually taking place. This second area opens up an ancillary topic, the element of design in the world and how it is traceable to a transcendent source. In this instance, moreover, the source under consideration is not Plotinus' ultimate principle or God, but an intermediate being a bit further down the ontological ladder. It is thus all the more useful for shedding light on this controverted area, since Plotinus' peculiar vantage point gives him a certain neutrality with regard to issues that emerge later in the debate about the argument from design.

In the case of both art and nature, 'reason' and 'form' (*logos* and *eidos*) are employed to describe the process of making, although they are present differently in the two different makers. *Logos*, as in the early treatises, denotes the active principle behind the making, while *eidos* picks up the content or model according to which the object is being made. Thus far art and nature are quite similar, and the one can shed light on the other. The difference between art and nature concerns, rather, how *logos* and *eidos* are present to or in each of the makers. Plotinus' contrast is between a presence that is internal in the case of nature and external in the case of the human artist.

But certainly nature which produces such beautiful works is far before them in beauty, but we, because we are not accustomed to see any of the things within and do not know them, pursue the external and do not know that it is that within which moves us: as if someone looking at his image and not knowing where it came from should pursue it. (V.8.2, 31-35: Armstrong translation)

Plotinus, taking his cue from Plato's *Symposium* and *Phaedrus*, enunciates in this passage the clear orientation of human experience toward the external, the sensible world, and the role of beauty in awakening the ascent of the soul toward the internal, the Intelligible world. This has a moral dimension, alluded to in Plotinus' own allusion to the story of Narcissus, where his pursuit of his reflection leads to his self-destruction. In a similar way, the general human determination by the external, sensible world is understood by Plotinus as the circumstance allowing for moral evil and, like Plato, he finds beauty as a first corrective to this moral descent. Implicit as well is the need for an intellectual

corrective, so that nature and art are understood from the point of view of the Intelligible world, reversing this natural orientation outward and the constant misunderstanding of the intelligible in terms either of the sensible or of the discursive character of human thought.

Again here, while Plato's corrective appears as the move from dialectic to myth, Plotinus feels obliged to give a more systematic articulation. He is unusually clear throughout this treatise, for example, in giving the limitations of experience and how they can be corrected, but is equally clear in dealing with the difficulties presented by Plato's often laconic or confusing *modus dicendi*. The following passages indicate some basic principles and areas of Plotinus' program of correction.

But we have not arrived at understanding this, because we consider that the branches of knowledge are made up of theorems and a collection of propositions; but this is not true even of the sciences here below. But if someone wants to dispute about these, let them go for the present; but about the knowledge there—which Plato observed and said 'that which is not a knowledge different from that in which it is,' but how this is so, he left us to investigate and discover, if we claim to be worthy of our title [of Platonists]. (V.8.4, 48-55: Armstrong translation)

For Plotinus, the non-propositional character of authentic knowledge is the key corrective for understanding the nature of knowledge at any level above human knowing, whether nature, Soul or Intellect itself. Thus when reason or planning are used of these higher agencies, they cannot be understood in a discursive sense, but rather as indicating their relative subordination to one another at this higher level. These terms will thus be applied to nature and soul not as claiming that they operate discursively in generating the multiplicity of the sensible world, but to differentiate them from the more unified character of Intellect as abiding more completely in itself. As in earlier works, these differences are articulated in reference to the Platonic Demiurge, whose functions Plotinus must carefully parcel out.

For this reason Plato, wishing to indicate this by reference to something which is clearer relative to ourselves, represents the Craftsman approving his completed work, wishing to show by this how delightful is the beauty of the model, which is the Idea....

Plato deliberately makes it clear that he refers the 'was delighted' to the model by the words which follow: for he says, 'he was delighted, and wanted to make it still more like its model,' showing what the beauty of the model is like by saying that what originates from it is itself, too, beautiful

because it is an image of the intelligible beauty. (V.8.8, 7-11, 15-20: Armstrong translation)

Besides indicating Intellect as the ultimate source of the beauty of the sensible world, Plotinus also makes reference to his method. The sensible world is the beginning of our experience, so our concepts and ideas begin from here as the realm that is clearer to us. That is, we begin with things known through the senses and our knowledge is expressed in propositions, which indicates, in the Greek tradition, the reasoning process of combining and dividing concepts. As we advance in the ascent to the intelligible, we must therefore engage in an ongoing critique of our experience and language so that what seems initially clearer might not interfere with our appreciation of that which is in itself clearer, the intelligible realm as such, and so that our articulation of its nature might qualify the discursive character of our own expression.

At this point, we have reached the end of this preliminary investigation. Passages from three treatises—V.1[10]; III.9[13].1; and V.8[31]—have been used to identify the issues and relevant terms for a discussion of the role of the Demiurge in the generation of the sensible world. The Demiurge itself is identified with Intellect, the Hypostasis Soul and the world soul to accommodate basic principles of Plotinus' ontology. The language applied to the activity of the Demiurge, 'planning' or 'reasoning,' needs to be distinguished in the other direction from its origins as characteristic of human knowing. Finally, the mode of operation of the Demiurge or nature, as it were combining the previous two points, is fundamentally distinct from human making. What is not yet clearly on the table is the relationship of all these points to the problem of providence. The final treatise to be considered, VI.7[38], brings these issues together precisely in terms of a discussion of providence.

## 2. The Nature of Providence

The beginning of the treatise, 'How the Multitude of the Forms Came into Being, and on the Good' (VI.7[38]), presents a tightly woven argument that focuses all the elements scattered in the three earlier treatises on the problem of providence. It begins with a clear statement of the *aporia* to be resolved: the presence of natural evil in the sensible cosmos and the remarkable way sense creatures are adapted to this hostile environment. This is the evidence for providence; but the problem is

showing whether such providence is possible and, if it is, how it works. He begins by making the contrast to human making more precise. The artist must necessarily use a reasoning process that includes foresight. This in a sense is nothing more than the combination of induction and deduction involved in the production of the object. That is, Plotinus recognizes that discursive reasoning tends to work from abstract or mental plans which seek to address the variability that results from combining these plans with an appropriate matter and from the vulnerability of these products to other natural forces, which can be just as hostile to the work of art as they are to the various beings that form part of the world of nature. The Demiurge, on all its levels—Intellect, the Hypostasis Soul or the world soul—differs on both these fronts. It does not need to plan, or form a hypothesis, nor does it need to foresee, or make deductions, since its product is not a combination of plans and matter as separate and discrete elements, precisely because it does not work with an already existing contingent thing or things where alternatives and multiplicities are involved. The sensible world is instead produced as a whole, illustrating Stoic *sympathy*, albeit in a radically modified form, and the demiurgic activity occurs within nature, paralleling Stoic seminal reasons.<sup>6</sup> To establish the Demiurge as an effective agent in the production of the sensible world, however, he relies upon a transformation of the Aristotelian notion of causality, allowing it to operate between levels of reality rather than within the physical world alone. All this, nonetheless, seems to leave little room for a notion of providence as planning and foresight in the generative agent. Plotinus, therefore, must either deny the idea of providence or understand it in some other way.

Finally, this exegesis of the Platonic Demiurge illustrates once more his philosophical method. In part this method implies a hermeneutic for understanding philosophical texts, especially those of Plato. Without the historic or developmental categories of modern exegesis, Plotinus is forced to find ways around the literal meaning of a text that still come from the text itself. We have already seen an example of this in the exegesis of III.9.1, where he delicately balances the literal meaning of the text and the principles he needs to give it a reasonable interpretation in terms of his own system. He uses an analogical sense of language, but is nonetheless cautious in solving his difficulties by this means, even though analogy is a fundamental principle with deep roots both in his ontology and theory of knowledge. Analogy provides one of the major correctives needed in going from familiar discourse about the sensible world to authentic discourse about the intelligible, but it must be supplemented by and

subordinate to a synthetic grasp that begins, as we have seen, from an overall understanding of the Platonic system, moving from there to some problematic area. In addition, there is room within this hermeneutic for the detailed analyses of the Stoic or Aristotelian traditions as ways of filling out the more schematic and sometimes enigmatic approach of Plato.

## 2.1 Providence and Planning

Plotinus begins VI.7[38] with a recognition that sense powers adapt their possessors to the world which they inhabit, which is both other and hostile (VI.7.1, 19-20). The *aporia* to be resolved is whether such adaptation is the result of rational planning (*logismos*), and if it is, of what kind. Providence (*pronoia*) is the indicated mode of such planning and thus the topic of investigation. The difficulty is to determine how providence can operate in the intelligible world and, more specifically, if it does, what is its nature.

This is the providence, that they might be saved being in evil, and this is the plan [*ho logismos*] of God (Cf. *Tm* 34a8) and rational planning [*logismos*] in general. (VI.7.1, 19-21)

The statement of the problem includes as well the major objection to providence or design: the presence and influence of evil. In this context, of course, Plotinus is referring to natural evil, the result of the generation of a level of reality that is divided into parts, with the necessary result that some of those parts will be in conflict with one another. Though providence with regard to ensouled creatures involves their being protected from evil through the use of their senses, the evil itself is a necessary part of the system. Providence is therefore analogous to the rational plan and foresight needed to deal with the contingencies of sensible existence, as in the case of human making. His first argument, however, begins with an attack on this parallel to human making by inquiring into the principles through which providence operates in governing the cosmos.

But what are the principles of these rational plans [*logismoi*]? For indeed, if they are from other plans [*logismoi*], it is necessary to go back in all cases to something or some things before rational planning [*logismou*]. What then are the principles? Either sensation or intellect. But sensation is not yet, therefore intellect. But if the premises are intellect, the conclusion is knowledge; therefore there is nothing about the sensible. Where a principle

is from the intelligible and reaches completion in the intelligible, how is it possible for this same disposition to reach completion in discursive thought [*dianoesis*] about the sensible? (VI.7.1, 21-27)

It is a commonplace among the ancients that reasoning is necessarily a process that uses principles that function as the starting points for the arguments that lead to truth or for the rational plans that lead to the making of an object. Such principles stop the regress of thought because they are eternal, unchanging and outside the system. Plato and Aristotle are both in agreement about this, although they express it in radically different ways. The difference is that Plato associated planning with the Demiurge as some kind of intelligent agent that ontologically precedes the generation of the sensible world, while Aristotle's elimination of the world of forms makes the causes somehow immanent in nature, with the different problem of relating this causality to a first-principle transcending nature. Plotinus is ironically quite content with Aristotle's mode of immanent causation, and exerts far more effort to explain Plato's description of the Demiurge as actually planning, given that such a mode of thinking seems incompatible both with intelligible knowing and with immanent natural causality.

Plotinus uses a complex dialectical argument to examine the relation between intellect and reason, investigating the original problem of the Intellect's provision for the needs of sensible creatures. He begins with an explanation of Plato's affirmation that providence is from rational planning, based on the analogy to human making, where the wise, working with things that already exist in the world of becoming, must plan how they should be arranged and foresee how they will be used.

So providence from reasoning [*logismou*] is neither about a living being nor about this particular universe at all, since there is really no reasoning [*logismos*] there, but reasoning [*logismos*] is affirmed [by Plato] in reference to an indication from the universe in this way, as another wise maker works from reasoning [*logismou*] on things that are later, and foreseeing is also affirmed, because it is in this way that someone wise would pre-know it. (VI.7.1, 28-32)

Two aspects of human making are highlighted in this analogy used to explain the vocabulary Plato ascribes to the Demiurge: the inductive type of reasoning needed to use the material available profitably, and the deductive type needed to predict possible problems with the product and how to correct them. It is an indication, on the one hand, of how well

nature is constructed and adapted to innumerable contingencies and, on the other hand, of how much the analogy limps when one actually looks at the operation of the Demiurge. This second aspect occupies the next major section of the argument.

For among those things that do not come about before reasoning [*pro logismou*], the reasoning faculty [*ho logismos*] is useful for want of a power which is before reasoning [*pro logismou*], and foreseeing [*proorasis*], because the one who foresees does not have the power according to which he does not need foreseeing. Thus foreseeing [*proorasis*] occurs that it might not be *this* but *that*, and, so to speak, is afraid that it not make something of a particular sort. But where it is only this, there is no foresight. Likewise the reasoning faculty [*ho logismos*] makes a *this* before a *that*. But when there is only one alternative, what will it reason [*logizetai*]? (VI.7.1, 33-39)

Foresight and reasoning are shown to derive their function from the need of a creature who works with a material that is already at hand and therefore has to anticipate how the object will interact with other things, also not of one's making, that may well interfere with its purpose. The contrasting situation of the Demiurge is central for Plotinus' understanding of the effortless working of providence in the ordered generation of the sensible world. He proceeds:

How indeed does the alone and one and simple have that which is unfolded, '*this* that it might not be *that*,' and 'for it would be *this*, except it is *that*,' and '*this* appeared plainly useful and salutary having become *that*'? Did it then foresee and did it then pre-plan [*proelogisato*], and in particular—what has been said now from the beginning—did it give the sensations and their faculties through this means, even granting that the giving and its mode are especially hard to understand? (VI.7.1, 39-45)

I have adopted Hadot's reading\* of the second sentence here as a question, which has the advantage of making Plotinus' position consistent and setting up the precise conditions of the *aporia*: that without any kind of planning or foreseeing the Demiurge can still produce providentially. His solution, given in the rest of the chapter, is to show how Intellect can maintain its unity and also become the source of sensible multiplicity. Intellect, as a unified and perfect act, already combines present and future, so that the future is already in it, and everything that will come to be is already always there. When it is unfolded in time, then, it is as if it has been thought out beforehand, but this means only that there is nothing deficient since the act of Intellect is perfect and complete, the internal

cause (*en heauto kai tēn aitian*) of the unfolding (VI. 7.1, 45-57). Thus Plotinus posits preexistence, a preexistence that is perfect and complete and that acts from within, instead of the planning and foreseeing that characterize human making, as the nature and method of providence. With this structural change in understanding the nature of the unity of the cosmos, Plotinus is able to establish Stoic *sympathy* without Stoic materialism. We shall see later how he uses the notion of immanent causality in connection with the Stoic seminal reasons.

An analogy from human activity, moreover, might clarify this model of making from within, and it has the advantage of being used by Plotinus himself, though in a slightly different context, to understand the immateriality and consequent interpenetrability of the Intelligible world. It is the development of a science and its theorems (cf. above, V.8.4). For our purposes, it is perhaps easier to switch the analogy to the origin and development of a language. In any case, it makes no sense to say that a language or science is planned, much less that its development is foreseen. It is, as it were, contained whole and entire in the human capacity for communication. When a particular group begins to speak, this capacity for communication is unfolded as a system of meaning that cannot be radically deficient, otherwise communication could not take place at all, but is always moving unerringly toward further completion, with the rules of development operating unconsciously and immanently within it. This makes sense not only in terms of what Plotinus means by the notion of providence and the workings of the Demiurge, but also in relation to the argument for the existence of God from design. Thus the analogy of God to a clockmaker can be justifiably critiqued, but a more subtle argument about the development of order in the universe along the lines of Plotinus' position is both much more cogent and more than likely the model behind the classical Medieval formulations of the argument. This kind of argument is, moreover, implicit in the above passage, where an indication from this universe is used to understand the nature of the intelligible.\*

This brief section has set out the first part of Plotinus' program, with the silent incorporation of Stoic *sympathy* transformed into Plato's sense of the integral unity of the cosmos and the internal operation of its causality. What is left is Aristotle's analysis of causality and Stoic seminal reasons transformed into the crucial ingredients to explain the relationship between the sensible and intelligible worlds. Plotinus turns first to the Aristotelian position in the next section of the text.

## 2.2 Providence and Causality

In VI.7[38].2, he begins to reflect on the nature of causality as it appears in the sense world, where cause and effect are usually different things, in contrast to the intelligible, where they are always identical. His effort is to show how the substance (*ousia*) and essential nature (*to ti en einai*) of a thing (VI.7.2, 14-15) necessarily include both that it is and the reason why it is, such that the cause of the thing is within it as an integral member of the Intelligible world. This pairing of terms has a reference back to V.8[31], where *eidos* and *logos* are similarly joined, and forward to VI.7.4 & 5, where soul and *logos* will be analyzed in a similar way. The terms are Aristotelian, but Plotinus changes the way they are related. For Aristotle, substance is a *pros hen* equivocal, with *to ti en einai* as one of its meanings. In Plotinus, on the contrary, the two terms are related as co-principles, somewhat like form and matter in Aristotle, with one term expressing the activity of the thing and the other the thing as receiving that activity in a particular way.

Plotinus is moving the terms out of the Aristotelian context of sensible substance to the ontological context of the Intelligible world, where their relationship and function are radically altered. He thereby attempts to describe the dual operation of Intellect in the generation of its own content and ultimately of the sensible world. *Ousia* (substance) and *to ti en einai* (essential nature) thus allude to the two poles of the Intelligible world, being and knowing, both of which must contribute to, and be aspects of, any intelligible being. The relationship between these two aspects of the Intelligible world is something like that of Aristotle's act and potency, but the absence of matter in the Intelligible world changes the nature of the relationship from the horizontal generation of something similar in kind to the vertical generation of something different in substance, as lower and less unified.

This generation also proceeds from the very nature of Intellect as an act, and thus does not involve planning of any sort. Its own content is thus shown not to be planned, but to form an integrally and mutually constitutive unity-in-diversity. Each member of the Intelligible world is generated as an activity, but an activity that resides in some substance, always keeping the essential duality of the Intelligible world. In generating the sensible world, the same dual causality is at work, not making atomistic parts that need to be assembled in some secondary step, but proceeding immanently to create a whole where the parts emerge from

within it and at the same time act as co-agents in constituting its ongoing development.

He singles out one instance, the relation between the intelligible Man and the secondary man of becoming, to illustrate further this different kind of causality. At the beginning of VI. 7.3, he repeats the initial question, specifically asking if deliberation is a factor in the making of the sensible man.

What then prevents deliberating [*probouleusasthai*] about him before hand? Rather, he is according to that intelligible Man, so that neither is it necessary to take away nor to add anything, but [the Demiurge is said] to deliberate and to have reasoned [*to bouleusasthai kai lelogisthai*] by hypothesis: for [Plato] hypothesized for things that become. In this view there is deliberation and reason [*hē bouleusis kai ho logismos*], but by demonstrating an 'eternal becoming,' he denies that the [Demiurge] reasons [*logizetai*]. For it is impossible to reason [*logizesthai*] about the eternal. (VI.7.3, 1-6)

No new point is added to the initial discussion, but the restriction to a particular case clarifies the implications. As a result, Plotinus can argue that Plato does not use 'deliberation' and 'reasoning' in their strict discursive sense, but rather that the providence and rationality apparent from the sensible world show how closely it is an image of the Intelligible. Plato's hypothesis is, therefore, more like a metaphor, which he corrected by positing an eternal becoming. In a sense, qualifying the words of Plato is not merely an exercise in school loyalty, but an indication of the nature of philosophical discourse. Our understanding of the nature of things begins with experience of the sense world, but this implies a necessary critique that understands the sensible world and our way of knowing it as images that point to a reality, the nature of which is gradually articulated precisely as it is distinguished from the sensible. Plotinus thus exploits the ambiguity of the text, on the literal level, to indicate more than just clever exegetical *legerdemain*, since it articulates a critical principle in his own philosophical method, especially prominent throughout this treatise.

In the next chapter, Plotinus spells out how the intelligible Man is present in the man of becoming. He does so by means of an examination of *logos*, which has been linked in all the treatises considered here with the causality or activity of a higher reality on a lower level. This has been in conflict, however, with a sense of *logos* that is associated with human reason or the sensible cosmos alone. We have in the present context, for example, the Stoic notion of seminal reasons, which Hadot oddly takes as the Platonic productive *logos* in contrast to the Aristotelian definitional

logos (*Traite* 38, 217). It is not clear what he means by this Platonic productive logos; Stoic spermatik logoi seem the more obvious reference. It should also be noted that Aristotle's definitional logos is not meant in an exclusive sense, but as one of its technical usages. It remains to be seen, moreover, how Plotinus purports to bring these different meanings of logos, Stoic and Aristotelian, into harmony with one another.

Let us begin with his own sense of logos as an active principle. We have seen in V.1[10] that the Hypostasis Soul looked at as a whole can be described as a logos of Intellect, which emphasizes that it is the act of Intellect expressed in an external and secondary way. In V.8[31], art and nature use a logos as the active principle of their making, with form supplying the content. In the present context, the problem is the relationship between this logos as an active principle and the soul as that which receives it. On the one hand, soul and body form the composite living being; but, on the other hand, Plotinus argues, logos and soul must also be different, forming a type of composite on the level of the intelligible. Soul thus relates to the sensible composite as the logos of Aristotle's definition (VI.7[38].4, 17-28), and to the active logos coming from the intelligible Man itself as the *ousia* defined by this logos as *to ti en einai* cited earlier at VI.7.2, 14-15. Soul, by being what it is, generates something further in the sensible world, and the logos of the intelligible Man, as the active principle united with this soul, continues its active role by giving to the sensible man all the powers it needs to function. Like the power to communicate, this generation by soul and its logos does not need to be planned, because it is either there as a whole or it is not there at all.

He concludes this argument at the beginning of VI.7.5, where he links the intelligible Man and the sensible man by means of the logos that specifies the activities of a specific kind of soul and the composite being it establishes in the sensible world.

It is necessary, therefore, that man is a forming principle [*logos*] other than the soul. What prevents man from being something composite, a soul in such a forming principle [*logos*], where the forming principle [*logos*] is like a type of activity, but an activity that cannot be without that which acts? This is the case for the forming principles [*logoi*] in seeds, for they are neither without souls nor souls simply speaking. These forming principles [*logoi*] that make are likewise not soulless, and it is not at all amazing that these forming principles [*logous*] are such substances. (VI.7.5, 1-8: Armstrong translation)

In terms of previous treatises, soul is the *eidos* or *ousia* of the sensible man, while the logos, as the active principle coming from the intelligible

Man, is the *to ti en einai* that defines exactly what this kind of soul is as a substance or the spermatik logos that directs its unfolding in the sensible world.

At this point, Plotinus' anthropology can be seen in all its complexity.<sup>10</sup> He has the intelligible Man, the identity of logos and soul, which is the generative cause of the sensible man, the image of man made by soul and body (VI.7.5, 14-15). The various meanings of logos now fall into place. Logos as the active principle is used to explain the duality of the intelligible world Plotinus inherits from Plato, but it also incorporates the immanent cause denoted by the Stoics in their spermatik logos. Next the sensible composite of soul and body provides for the definitional logos of Aristotle's categorical theory. It is clear, moreover, that the rational forming principle (logos) is the key relating the intelligible and sensible, operating with the interior causality established earlier. Thus, whether in the case of the sensible universe as a whole or in that of one being within it, the result is the same. As an image of the intelligible it does not need to be made by any kind of planning or foresight, but proceeds as a whole from a whole, though it is unfolded in time.

A final passage continues this reflection on human nature. Plotinus repeats that reasoning as such is not in the Intelligible, but then asks why this faculty is only present in human nature in the sensible world.

For neither is the reasoning faculty [*to logikon*] There: for perhaps the reasoning faculty [*to logikon*] is here, but There that which is before reasoning [*logizesthai*]. Why does this man reason [*logizetai*] here, but no other living thing? Rather, since there is a difference There in thinking [*ou noein*] between Man and other living things, so there is also a difference in reasoning [*to logizesthai*]; for many activities of reason [*dianoias*] are in some way possible also for other living things. (VI.7.9, 9-14)

The major addition of this brief passage is to underline the analogous use of language that is behind Plotinus' whole discussion. 'Reason' is analogous in two different directions. Usually it shows the continuity between reason and intellect, but it can also indicate the continuity of reason in lower forms of knowing and perception.

Plotinus has shown in this section the subtlety of his position. What was implicit in the earlier treatises is faced with considerable frankness. It is interesting that the problem of evil is not the main sticking point in justifying providence; evil rather confirms the presence of providence in the sensible cosmos. The main problem concerns the possibility of providence given the nature of the Intelligible world. Our sense of how

providence works might begin with an anthropomorphic model, but Plotinus is relentless in showing that the reasoning and foreseeing of the human artist are at best ways around the defective character of human knowing and making. The Demiurge, as soul or Intellect, is not handicapped in this way and thus operates without such planning and foreseeing. It acts in a way that is both different and difficult to articulate. As the artist works premeditatively and externally, the Demiurge works without any deliberation at all and internally. When Intellect generates something, it has a dual aspect: It is a substance that has as well its own active principle within it. This establishes a chain of causality that moves from higher to lower levels of reality, reaching finally to the sensible world itself. This chain of causality is similar to Aristotle's, as composed of active and passive elements, but is radically different, as proceeding vertically rather than horizontally.

### 3. Conclusion

The discussion of providence afforded by these four treatises is far from complete. They provide instead an introduction to a topic that occupies Plotinus' attention at different times throughout the whole period of his writing. As a good introduction, they indicate the basic themes and problems that arise in relation to providence but none of them provide an exhaustive treatment of the problem, with objections and counter positions given and discussed. For that one needs to turn to the later treatise on providence, III.2 & 3[47 & 48]. Nonetheless they illustrate in a remarkable way how Plotinus goes about dealing with an issue, collecting his thoughts about one detail or another and building a case that is clearer and stronger as he goes along.

Another advantage of these four treatises is that the problem of providence is discussed in terms of the Platonic Demiurge, which means that Plotinus is forced to reflect a little more fully on the actual mechanism that allows providence to work. The problems he faces in this pursuit occur in multiple areas: the identity of the Demiurge itself, Plato's description of the demiurgic activity in mythical terms that are highly anthropomorphic, the difference between human reasoning and the thought of Intellect, and the difficulty in finding a proper way to articulate the causal activity of the Demiurge, whether as the world soul, the Hypostasis Soul, or Intellect itself. These problems come to focus in two major difficulties: the exact nature and functioning of the Demiurge as

providential and the proper exegesis of the Platonic *Timaeus*. While the description of the Demiurge is of central concern, the exegetical problem, tackled in one treatise after another, reveals some interesting insights into the way Plotinus actually philosophizes. Taking Plato as his model doesn't imply abdicating his own rational powers, nor does it imply an uncritical rejection of other philosophers, like Aristotle and the Stoics. In the texts examined, in fact, one of the main problems is elucidating what Plato means, given his use of myth and consequent lack of rational precision. While Plotinus' interpretation of the Platonic text is not exactly critical according to today's standards, it is not particularly fanciful. He respects the literal meaning of the text and articulates his own principles of interpretation. Where he can, he bases his interpretation on some facet of the text itself; where he cannot, he admits that he is following certain principles to explain what Plato has put incompletely or enigmatically. In the process, he is outlining a theory of analogy that is not without connection to his overall purpose in enunciating the principles of providence, that is, indicating the nature of the sensible as an image of the intelligible.

In summarizing his discussion of providence, however, he shows first that the providential role of the Demiurge must itself be spread out among various levels of his own hierarchy of Being. The role of Soul as an active agent must be distinguished from that of Intellect, to preserve the perfection of the Intellect itself. World soul must in turn be distinguished from the Hypostasis Soul for similar reasons. With the agency thus parceled out, the attention shifts to the process, the planning, reasoning or foreseeing, that is used to introduce providence into the sensible world. The planning and foreseeing of the Demiurge are sharply differentiated from the processes of human thought, which give them their names and to which they are analogous. Plotinus moves in two directions at once, distinguishing the role of the soul from Intellect and then making a similar distinction between soul's activity and human thinking. Thus he applies planning and foreseeing to the activity of the Soul in distinguishing it from Intellect, but provides a critique of this usage to avoid an anthropomorphic understanding of providence. Such a critique is particularly crucial in terms of the natural tendency to understand the intelligible world and its operations in terms of concepts derived from the sensible world and human activities operative within it. Plotinus thus has two tasks, to indicate the foundation of the analogy in the nature of the sensible world and human thinking as images of the intelligible and to distinguish the actual nature and activity of the intelligible from these sensory images and models.

Plotinus provides a dialectical movement of affirmation and negation to accomplish his purpose and to safeguard both the relative validity of sense experience and the possibility of authentic knowledge of the intelligible itself. Finally, he must provide a positive understanding of the relation of the Intelligible and sensible worlds through a causality that can adequately link them. He tacitly admits that Plato's works do not provide such a causal theory. He must therefore borrow from Aristotle, especially his understanding of act and potency, but needs to do a bit of reworking to allow causality to operate between different ontological levels. What results is a very subtle account of providence based squarely on the Platonic position that the sensible cosmos is a beautifully complex image of the Intelligible world.

## NOTES

1. More information on the Stoic notion of providence and its relation to that of Plotinus can be found elsewhere in this volume in the chapter by Laura Westra, "Freedom and Providence." Her discussion focuses on the impact of providence on human freedom and moral responsibility, both among the Stoics and in Plotinus himself. My discussion emphasizes the Platonic sources for providence especially in earlier treatises and thus is complementary to Westra's discussion of III.2 & 3 [47 & 48]. It also provides support for her contention that Plotinus "should not be resolved into his sources," by showing how those sources fit into a Platonic context. In addition, the inclusion of Aristotle's theory of causality forms part of the general metaphysical aim showing how providence functions within the confines of a Platonic theory of reality. Further analysis of Plotinus' relation to Aristotle in terms of his metaphysical interests can be found in my article, "Plotinus and the Platonic *Parmenides*," *International Philosophical Quarterly* 32 (1992), 441-445. Thus, while Westra concentrates more clearly on the anthropological and ethical repercussions of the doctrine of providence in Plotinus' major discussion of the topic, this paper focuses on ontological and noetic issues scattered in several earlier treatises.
2. Armstrong, *Plotinus: Enneads*, Loeb Classical Library: 7 volumes (Cambridge, MA: Harvard University Press, 1966-1988), states that Plotinus always identifies the craftsman with Intellect, and never with Soul (volume 5, 40 n1), but the passages examined here state rather unambiguously that the Demiurge is concerned with the universe more directly than is possible for the Intellect. It is much simpler to follow Igal's thesis, *Plotino: "Enéadas" I-II, III-IV* (Madrid: Editorial Gredos, 1982, 1985), I-II, 73, 79-83, 405 & III-IV, 267-268, that the demiurgic function is analogous, with Intellect the true maker and Demiurge (V.9[49].3, 25-26), the Soul, as receiving the *logoi*

from it, the planning principle, and lastly the world soul making the actual divisions in the sense world (III.9[13].1 and II.3[52].17 & 18). My book, *Plotinus: The Experience of Unity* (New York: Peter Lang, 1988) confirms Igal's thesis by showing how it fits into the major structural paradigm that undergirds both Plotinus' ontology and psychology. Atkinson, *Plotinus: Ennead V, 1, On the Three Principal Hypostases* (Oxford University Press, 1983), 22-23, also admits the different references of the Demiurge in Plotinus' usage.

3. Armstrong, neither in his synopsis nor in the translation, indicates the change from world soul to the Hypostasis Soul. This is not surprising, since his notes on IV.9 do not indicate that Plotinus distinguishes the Hypostasis from the world soul, although his translation is accurate enough to express it (e.g. at IV.9.1, 13). H. J. Blumenthal, "Soul, World-Soul and Individual Soul," *Le Néoplatonisme* (Paris: Éditions de Centre de la Recherche Scientifique, 1971), 55-63, and Igal III-IV, 545, both maintain that Plotinus does distinguish the Hypostasis from the world soul, but are somewhat hesitant about how early this takes place in Plotinus' writings. In the context of V.1, the unity of chapter 3-7 about the Hypostases and the parallel between chapters 2 and 10 on the relation of the world soul and the individual soul, for both of which the Hypostases are described as external, indicate that the distinction is operative, despite Plotinus' laconic transitions. Atkinson, *Ennead V, 1*, 62 & 89, presents Plotinus' argument as if the same soul is being discussed all the way through, with the resultant complaint of inconsistency.
4. Igal III-IV, 268 n18, makes this question of the meaning of *dianoesthai* and *dianoia* explicit, which Armstrong implicitly supports by translating them as 'plan'. Armstrong's problem, as noted, is the identification of the Demiurge with soul, which he argues Plotinus never does (vol. 5, 40 n1). Igal, both in III-IV, 267 n13, and in I-II, 73, argues that Plotinus posits three Demiurges: Intellect, Hypostasis Soul, and world soul. Igal's position reflects the fact that Plotinus divides the various functions of the Demiurge in the *Timaeus* so that each function is matched with an appropriate level of Being, which Armstrong reluctantly admits in his note on the present treatise (volume 3, 410 n1).
5. The same difficulty can be found in terms of time and eternity, where the Soul is described as eternally in the Intellect, and yet as temporal. P. Manchester, "Time and the Soul," *Dionysus* 2 (1978), 128-136, explains this paradox by showing that there is a Time-in-itself in the hypostasis Soul and a successive time in the sensible order. In a similar way, the content of the Hypostasis Soul is both less unified than that of Intellect, since its movement is directed outward, but more unified than its successive unfolding in Nature. Though unified in itself as within the Intelligible world, this focus outward to the division of sensible bodies makes the term 'planning' a more fitting description of its activity.

6. It is worthwhile to compare this internal agency with the comments of Laura Westra about the Stoic background in the second part of her chapter in this volume. She points out the immanent way in which the world soul operates and the impersonal character of the logos which establishes the unity of the natural order. Providence for the Stoics, she observes, has three goals: to structure, to complete, and to beautify the world. These three aspects of providence are part of Plotinus' own program, but they are not so much goals as means to achieving the goal of conforming the sensible world to its intellectual archetype. Westra pushes this a bit further back to the Good or One as the aim of all things. This is indeed true, although the particular interest of my argument is restricted to the relation of providence to the Intelligible and sensible worlds alone.
7. There is some textual difficulty at VI.7.1, 30–32, with Harder deleting *allos sophos* and Theiler deleting *en tois hysteron* (Cf. critical apparatus in H-S<sup>2</sup>). Theiler's deletion has been followed, since it makes no essential difference to the meaning. Harder's deletion, however, is another matter. I take both clauses as referring to human making in contrast to the providence of the world soul or Intellect, and thus "the other wise one" is the human craftsman, who works from a plan and on materials that already exist. This is consistent with Plotinus' usual point of contrasting the discursive nature of human reason and the non-discursive nature of higher souls and, especially, of Intellect (Cf. IV.4.12). The alternative is that the world soul, as the making Demiurge, is contrasted with Intellect. This does not, however, seem to account for all the elements as easily as the human craftsman. 'On Providence I&II' (III 2 & 3[47 & 48]), moreover, provides a confirmation of this reading.

The ordering of the universe, then, corresponds with Intellect in such a way that it exists without rational planning [*logismou*], but exists so that if anyone could plan rationally [*logismō*], as well as possible, he would wonder at it because planning [*logismos*] could not have found out another way to make it; something of this is observed even in individual natures, which come into being continually more conformed to Intellect than they could be by an ordering which depended on rational planning [*logismou*]. (III.2[47].14, 1–6: Armstrong translation)

8. Pierre Hadot, *Traité 38 (VI 7)* (Paris: Les Éditions du Cerf, 1988), 195–197. While one or another point might be disputed, this translation and commentary is invaluable for understanding this complex treatise. It is particularly helpful in the part immediately after the texts that are of concern here, where he discusses Plotinus' anthropology in a rather full way.
9. The claim that Plotinus has anything like the argument for the existence of God from design is on the face of it quite improbable. The transcendence of the One and its necessary lack of interest in the emanations from it are both

emphatically and consistently maintained throughout the Plotinian corpus. The argument presented here in fact gives indirect confirmation of this central Plotinian thesis. It is thus not in relation to the One that a version of the argument from design can be found, but rather in the role of the Demiurge in generating the sensible cosmos from its intellectual archetype.

This different context gives the argument a character much different from later versions working from Christian presuppositions. Plotinus argues that the sensible cosmos, including the evil that is present within it, must have its immediate origin in the Intelligible world, focusing his attention on the nature and mode of design itself. In agreement with later authors, Plotinus thus sees the issues of providence and theodicy as at the heart of the argument from design, but they operate in a strange sort of way. The agent, here the Platonic Demiurge, must be kept as far as possible from any whiff of pre-planning or deliberation. This is a corollary of his general principle, already mentioned above, that a higher reality is transcendent in such a way as to be uninvolved with what follows from it as well as his specific principle that the mode of knowing in the Intelligible world is non-discursive. This joint metaphysical and epistemological restriction gives his argument a sophistication that is not without relevance for understanding the cogency of such arguments in contemporary debate. Plotinus' scheme makes quite clear why design or order or reason are discernible in the workings of the physical universe, and thus how that design is discoverable by the human mind and expressed in discursive sciences. This in no way means, however, that the agent, whether looked at as Intellect, Soul or world soul, has a similarly discursive plan or model. In other words, Plotinus maintains a clear distinction between the operations of nature and those of human making. Thus design has nothing in common with William Paley's version of the argument in his *Natural Theology*, which makes a jump from inferring a watchmaker upon finding a watch to inferring a divine agent upon finding a stone. Our explanation of the stone can be logical and reasonable, but that does not entail that nature itself has a blueprint that somehow corresponds to our explanation. Plotinus is explicit, moreover, that nature cannot in fact operate in the way a human agent does in making an object. The sensible world, therefore, is ordered and unified not because nature is a conscious cause working with a plan, but because the alternative, as neither ordered nor unified, could not even exist.

The medieval argument from design, as found for example in Aquinas' fifth way, where things that lack knowledge still act for an end, depending on an intelligent being which directs them to their ends, has more in common with Plotinus' argument than Paley's. It is intelligence as such, and not the capacity to form a plan, that directs beings toward their ends, which are seen as part of an ordered and unified whole. The difference in this case is that Plotinus' ordered hierarchy of causes pushes the problem of design away from God as first principle and toward divinities (Intellect and Soul) as

mediating principles. From this point of view, certain issues become clarified in greater detail, as can be seen in V.8[31] and VI.7[38], where the distinction between divine and human production can be seen with a subtlety that Christian theism tends to find superfluous. Plotinus has a middle position between full intelligence, expressed in Intellect and Soul at their highest, and the discursive character of human thought. This middle position allows for a more complex analysis of the actual working out of design, the conclusions of which can be used to supplement the more tersely described operation of design in a system where creation takes the place of generation.

10. Igal, "Aristoteles y la evolución de la antropología de Plotino," *Pensamiento* 35 (1979), 315–346, and "Introducción General" I–II, 52–62, shows how Plotinus combines Aristotle's division of the soul into vegetative, sensitive and rational with Plato's different division into rational, spirited and appetitive parts. H. J. Blumenthal, *Plotinus' Psychology* (The Hague: Martinus Hijhoff, 1971), 21–22, 48, 103–104, 135, argues very strongly that Plotinus rejects Plato's tripartition of the soul, only using it in ethical contexts where it seems less in conflict with his general theory of soul. Accounting for evil obviously confronts Plotinus with a different set of problems than the cognitive operations for which he favors Aristotle's faculties. Plotinus must preserve the soul's impassibility while at the same time giving it some role in the explanation of evil. Plato's two lower parts, the appetitive and spirited, provide the context in which evil can take place, but the role of the rational part is also recognized as causative. There is no reason, however, to see this as in conflict with the use of Aristotle's psychological faculties to explain various sensory processes, such as perception and imagination.

## FREEDOM AND PROVIDENCE IN PLOTINUS

Laura S. Westra

I contend that *freedom* represents the central notion in the philosophy of Plotinus. Although there are only four instances of 'free' (or 'freedom') in the *Enneads* as a whole, with the exception of the intensive discussion of the concept in *Enneads* VI.8, if the One is Absolute Freedom and the One represents the culmination of Plotinus' philosophy as well as our highest ideal, my contention is defensible on textual grounds. Yet, although our ascent to the One is through virtue and this assumes at least some possession of freedom, so that we can be viewed as moral agents, a question remains: What is the relationship between the 'self' (or our 'upper soul') and universal laws? If such laws are rational, ordained, eternal, and immutable, what does this imply for individual freedom? Can we maintain the position of staying determinedly aloof, uninvolved and free—as Plotinus counsels—even though we are part of the cosmic organism and thus subject to its laws?

### 1. Introduction to the Problem

*Pronoia*, the Greek term for providence, means 'pre-knowing.' Now, this notion seems to imply a fixed series of circumstances, with the one following upon the other in a relentless sequence, whereas *freedom*, in both its fullest sense (as descending or as originating from the One) and its derived sense (as ascending, as a commitment and an ideal from our standpoint) seems out of place in such a context. As we will see, Plotinus' views on providence are played out against the background of the Stoic conception, for he accepts some of the tenets of the Stoics and rejects others.<sup>1</sup> In the final analysis, the problematic we are dealing with here (i.e. the role, and even the possibility, of freedom in a universe under the rule of providence) will give us an answer to the question whether providence as Plotinus discusses it is—and can be—mainly Stoic.

The notion of Plotinian 'virtue' may be viewed as progressively freeing us from involvement—and even connections—with others as much as possible.<sup>1</sup> There are difficulties in trying to reconcile the way this term is understood in ordinary language with its meaning for Plotinus. In the case of virtue there are three possible senses to deal with: virtue in its religious sense, virtue in its moral but non-religious sense, and moral virtue in its Plotinian sense. Examination reveals that there are serious differences between the third sense and the first two senses, and that these differences are rooted in the central notion in Plotinus' thought, namely, freedom, which has a special meaning for him and plays the central role in his metaphysics. Freedom is a notion that tends to illuminate the more obscure aspects of his thought.

The problem of the conflict between providence and freedom is even more acute because the ordinary-language understanding of the former is exclusively religious. We may speak, for example, of 'providing for someone' or of an event as 'providential,' but the noun does not really lend itself to nonreligious uses. Furthermore, we must remember Rist's warning about "not dissolving Plotinus into his sources."<sup>2</sup> In few contexts is this danger so acute as in the case of providence; in fact, if the role of freedom in his philosophy is not properly understood, the difference between Plotinus and the Stoics when it comes to providence will appear minimal. And this may lead to further misunderstandings. For instance, A. Graeser, after comparing a number of Plotinian texts with texts found in the Stoics, concludes by calling Plotinian free will "a precursor to Kantian good will." Not only does this appear anachronistic, it is a conclusion that totally disregards the meaning of the ascent and the supernoetic nature of its goal for Plotinus.<sup>3</sup> He adds: "Plotinus, to be subjected to this intelligible environment is evidently guarantee of its liberty,"<sup>4</sup> which is hardly the whole story. The 'intelligible environment,' for Plotinus and also in some sense for us, is a given against whose limits and confines our individually-won quest for personal liberty is to be fought out. Moreover, the 'intelligible environment' is not just limit and background but also the embodied reminder of our own intelligible beauty and of our capacity (which, unfortunately, is not guaranteed to succeed) to reach beyond it, to freedom.

Bréhier provides us with another example of what can go wrong when we limit ourselves to Plotinus' sources in trying to understand him. Bréhier suggests: "The name 'One' contains perhaps nothing but the negation of the manifold." He then quotes Dean Inge to the effect that "perhaps Plotinus utilizes the word 'One' only because the Greek had no

symbol for zero."<sup>5</sup> Even a cursory glance at *Enneads* VI.8 and many of the passages examined in this study flatly rules out such an interpretation. Neither sheer Unity (an interpretation apparently based on the Pythagoreans) nor 'zero' can even begin to do justice to the multifaceted Act, Being, Good, and Freedom in the One, especially in His providential role. Therefore neither of these interpretations captures Plotinus' originality.

The problems we face in this essay, then, are twofold. On the one hand, we must guard against reading too much of his background and sources in his notion of 'providence.' To make sure that inherited concepts are kept separate from what is original in Plotinus, I will begin with a brief examination of the Stoics. On the other hand, we must be equally careful not to import later and alien meanings into his conception of providence. To guard against this danger, I will also discuss briefly the difference between the Christian understanding of providence and the view held by Plotinus. In the process I will draw directly on the Gospels rather than taking up the treatment of providence in this or that Christian philosopher or theologian. In relation to both of these problems, the original Plotinian meaning of freedom will suffice to steer us away from misunderstandings. In the former case, we will see that the main difference between the Stoic conception of providence and the Plotinian one hinges on the meaning of freedom. And in the latter instance we will have to rely on 'freedom' as well to keep Plotinus' view of providence separate from the conception to be found in ordinary language.

## 2. The Stoic Background

The background to Plotinus' doctrine is to be found in the Stoics. The main meaning of Providence in the Stoic context is "foreseeing and foreseeing correctly."<sup>6</sup> Plutarch regards Zeus and Providence as two possible separate roles played by the same entity, although this interpretation might not be accurate.<sup>7</sup> Reale instead emphasizes Providence as "a consequence of the affirmation of finality" and as a concept that is largely original with the Stoics, although he notes that "it does not have anything to do with the providence of a personal God."<sup>8</sup> He views Providence as an expression of "universal finality," since every being is part of the logos (reason) and is therefore good in that sense. It is the "immanent artificer, the World Soul," Reale says, citing Cicero.

Reale's claim about the lack of a personal God as a major component of the notion of Providence is the main point to be defended in any effort to show that there is a difference between a religious understanding of Providence and the Plotinian/Stoic counterpart of this notion. Therefore I will cite a few Stoic sources and discuss them. Cicero says the following about Zeno's doctrine: "Such being the nature of the world-mind, it can therefore correctly be designated as practical wisdom, or Providence (for in Greek it is termed *pronoia*), and this Providence is chiefly directed and concentrated upon three objects, namely, to secure for the world first, the structure best fitted for survival, next, absolute completeness, but chiefly consummate beauty and embellishment of every kind."<sup>11</sup> All three 'objects' are creatively intellectual. Providence is planning and organizing the whole, ensuring that the world is fit to survive, complete and beautiful, that is, intellectually organized. In the providential relation, the relata are 'Providence' and 'the world,' and no personalized concern for any individual part of aspect of the world is required. The relation is that of a far-seeing planner to his well-put-together plan. The result is 'good' in the sense of being emotionally charged with goodwill toward any human being or entity.

In another passage Cicero praises God's power and his ability to accomplish anything "without toil," which is unlike the way our mind directs our actions and decisions. He says: "the moulder and manipulator of the universal substance is Divine Providence, whithersoever it moves, is able to perform whatever it will."<sup>12</sup> Reale here draws the obviously correct conclusion I mentioned earlier, namely, that providence is not concerned with individual human beings. But a further point can be made beyond the one Reale mentions: Providence appears to have a will. The passage cited indicates not only the ability to perform any chosen action but also the freedom to do so. In this way Providence manifests freedom in its activity, which is a point not explicitly argued for but well worth keeping in mind when we return to Plotinus.

Finally, Stobaeus discusses 'fate' in Zeno and Antipater. Fate can also be called 'nature' or 'necessity' as well as 'Providence.' Other appropriate terms that could be used are 'truth,' 'cause' and 'logos.'<sup>13</sup> This represents an interesting move away from the dichotomy of Ideas/Demiurge (on the side of reason) and 'necessity' as sheer unformed matter in Plato's *Timaeus*. Reason is no longer just external and in opposition to the matter of the Universe; instead it is an immanent principle of regular, forming and organizing/planning power. Therefore

freedom is necessarily in Providence, as is rationality. This is no longer Plato's doctrine, but it is not quite Plotinus' either, as we shall see.

This is not the place to rehash the abundant literature on the problem of freedom in the Stoics, who wish to retain morality (as based on personal responsibility and thus on free choice) while at the same time upholding Fate (as Necessity? or as Providence?). Rist has analyzed this aporia. Some actions, after all, are in our power: for instance, we affirm our freedom by means of the ultimate choice open to man (i.e. suicide) in certain appropriate circumstances. This position was held by the Stoics, and by Plotinus as well: "Obviously we shall die; that is fate. But there is no necessity (in Chrysippus' sense) for us to die at any time other than the time we choose."<sup>14</sup> This sentence is not obviously true, for one might decide to commit 'therapeutic' suicide tomorrow but be struck down by lightning or robbers today. Nevertheless the sense of being able to choose freely is clearly part of the decision to commit suicide when understood along the lines of the Stoics and Plotinus. Rist says: "Fate for Chrysippus is what will be, not what must be, and that still allows for something to be in our power (*eph' hēmin*)."<sup>15</sup> If this is so, then fate and necessity are not one, nor is Providence interchangeable with these notions. And freedom is Fate's (or Providence's) unlimited power to choose, but then it is drastically altered in its meaning as far as we are concerned. Plotinus' freedom of the self goes beyond "the ability to be a co-worker with fate" and then to go along willingly as the wise man must do (he is the only one who is truly free, in Stoic terms), as opposed to those who are "dragged along behind the cart."<sup>16</sup>

Yet, if Providence, at this point, means no more than that certain law-like regularities obtain (necessarily) through the connections of causes which "make any object *qua* object what it is and not another thing,"<sup>17</sup> then we can at least conclude that Providence is not in conflict with Freedom, for it belongs to a different category of things. Freedom, for humans, is a state acquired through virtue, but is not come by easily. Freedom is not to be understood as a description of a state of affairs which obtains and of the natural laws within whose gambit human beings' quest for well-being and their ascent must take place.

We can therefore see what Reale means when he speaks of Providence and 'finality': It is the goal of the perfect, completed design of the world as it is and as it will be. Individuals indeed participate in this 'Providential order' as fitting parts of it, not as persons with specific interests, needs or concerns aside from those that are appropriate to their role within the totality of the world.

### 3. Plotinus and Providence

What is Providence for Plotinus? As we noted, the Greek expression means 'foreknowledge'; it is a noetic, not an effective, term. It does not seem to have anything to do with 'providing' or 'taking care' of things or people. All that is involved is perceiving beforehand. This much one can pick up from studying the Liddell-Scott Greek lexicon.

Plotinus begins *Enneads* III.2 by rearticulating an often repeated concern: We must not attribute the existence of all that is to chance or accident. Furthermore, Providence should not be confused with our sort of providence—viz. foresight—"which is a calculation before action how something should happen or not happen in the case of things which ought not to be done, or how we may have something or not have it" (III.2.1, 11–14). Thus, in its individual meaning, at least, Plotinus understanding of Providence clearly involves a judgment and an anticipatory calculation about future actions and contingencies. It does not involve others, except perhaps as components of the actions and situations we might deliberate about.

As far as the divine aspect of this notion and its meaning is concerned, it is to be understood as "the foreseeing and calculation of the divine [probably soul: *proosasin tina kai logismon theou*] about how all this might come into existence, and how things might be as good as possible" (III.2.1, 18–19). This does not entail a time when the universe did not exist or a prior deliberation and decision that was followed by a coming to be of all that is. Rather, as we have seen, we are to think in terms of a "spontaneous outflow of creative power," as Armstrong puts it in his note to the translation of this passage. "It is the manifestation of the One's Freedom: It is not so much a direct 'outflow' as an outflow that proceeds through Intellect, who is prior in nature and is the cause of the universe as a kind of archetype and model, the universe being an image of it and existing by means of it (III.2.1, 23–27). 'Each part is not cut off from the whole,'" says Plotinus, echoing Parmenides. "The universe as a whole 'lives and thinks all together as one,' so that even if individual parts are opposite to one another, they still belong together. No single part of the universe 'has become merely other, estranged from the rest' (III.2.1, 33–34).

The manifestation of individual ascending freedom does not require as primary that we consider others specifically and individually, whereas it does need respect and admiration from our Source and what comes from There, that is, the universe as a whole." We can now see that its

counterpart, the manifestation of the freedom of the One (Providence) also entails consideration for the Intellectual unity of the Universe and its appropriateness as a whole.

The freely creating power of the One, "the power to produce something else, without seeking to produce it" (III.2.2, 12–13), brings about the Intellect, which in turn, through Soul, without effort or means, creates the interconnected intelligible beauty which is the universe. Providence thus appears to consist of the freely produced completeness of the whole. By way of example, Plotinus points to the relation between Providence and man: "But the divine exists also as things are; and has come to something other than itself, not to destroy the other but, when a man, for instance, comes to it, it stands over him and sees to it that he is man; that it, that he lives by the law of providence, which means doing everything its law says" (III.2.0, 4–8).

Two points emerge here. The first relates to the lack of planning on the part of the One and to the Intellect's free outflow, to which Plotinus returns in V.8.7, which is entitled 'On Intelligible Beauty.' The intelligible world order is a principle, he says, and "in this sense it is well said that we should not enquire into the reason why of a principle" (V.8.7, 43–46). And since 'principle and goal' together form a whole and are to all intents and purposes one and the same, no imperfection or deficiency can arise within it: It is—as a whole—beautiful. It was not laboriously designed through planning or syllogism, and it was not the result of rational inquiry, that is, using the rationality of Intellect. Clearly, no rational argument or inquiry and debate is possible at the level of the One—only effortless, free production. When intellectual endeavour is possible, as in the second Hypostasis (Intellect), then we still do not have process—nothing prior (deliberation) followed something posterior (the formed world), for the two coexist eternally in the form of Beauty as principle and Beauty as completed, perfected goal.

The second point also hinges on the true meaning of freedom and its import in Plotinus. The question that arose in connection with the Stoic meaning of Providence and Fate was: How could individual freedom and a thoroughly complete world order coexist? The passage cited above can help us understand how Plotinus was able to speak on the one hand of the 'law of providence' and 'doing everything which the law says,' while on the other hand still describing freedom as the highest ideal to which man can aspire. Today most people agree that we are basically free to choose our course of action, even when we take into consideration a number of limiting and qualifying factors; to make this affirmation is not to deny the

interconnected material, psychical and logical laws that govern us. Thus, whereas the existence of a personally determined, 'providing' Providence might be viewed as intruding on our personal freedom, the existence of universal laws and regularities does not. It appears that Plotinus had the latter in mind rather than the former.

Such a harmonization is the "concord" of "intellect and necessity" (*nou kai anankas*: III.2.2, 33–34) to which Plotinus refers. This 'harmony' reconciles destruction with coming into being, parts which are friendly with others that are hostile, and those that are better with those that are worse. Because of this concord, it would be unreasonable to "blame the whole because of the parts, as if one were to take a hair of a whole living being, or a toe and neglect the whole man, a wonderful sight to see" (III.2.3, 14–16).

All things aim toward the Good, but they attain it in varying degrees, in proportion to their own receptive power. This is the point Plotinus makes in *Enneads* II.9. The excellence of the Source does not permit us to criticize that which proceeds from Him. However, we can and must try to understand, for all things do not participate in being and life in equal ways: "One must not demand equal gifts in things which are not equal" (III.2.3, 39). Nor should hostility and destruction surprise us: They are necessary in beings that are not meant to last forever. They have come into being as they are "because they all exist There, in the upper heaven" (III.2.4, 19). On the other hand, human beings act "under their own control," inclining to turn to "what is better" and "what is worse." Thus the necessary law-like design of the whole includes the existence of freely acting beings. It is only when these beings act according to the good that they live in well-being. Justice prevails either here or in future times; yet the prize of well-being lies essentially within our grasp, if we make the effort to be virtuous. Even poverty and sickness do not affect this well-being; moreover, they are "not without usefulness for the coordination and completion of the whole" (III.2.5, 8–9).

And so evil is explained without recourse to religious arguments, but in a way that will eventually be useful to Christians. Even the definition of evil is similar to the one to be found later in Augustine and Aquinas: "In general we must define evil as a falling short of good" (III.2.5, 26). Such a definition should not surprise us, for it is quite consistent with Plotinus' doctrine in general. We know where the true good is to be found. The 'evils' we perceive and have to accept do not affect our true well-being.

Plotinus' argument begins with the admitted prevalence of evils. And not only are evils prevalent, but their distribution appears unjust: bad men are masters of good ones and appear to have more than their fair share of worldly goods. Against this background it appears as though "Providence does not reach as far as the Earth" (III.2.7, 34). But note that Plotinus is not wondering who will provide for the unfortunates of the world; his concern here is rather about the extent of the rational pattern of the universe. We cannot deny that even animals and plants share in it. Do we perhaps need to doubt its power?

Again we might be misled into considering some of these parts (evils) in isolation from the whole, as we are tempted to approve of the good while censuring the bad. It is as though we were to claim that heads are fine while the rest of the human body is not quite right, which would be improper from the standpoint of logic and would also fail to show proper respect for the Source of all creation. Logic will not permit us to demand that one part of the integrated organism be dismissed as unworthy; piety and reverence ought to restrain us in our complaining. The first of these two grounds appears more philosophically sound than the second. In general, even the prevalence of evil and injustice should simply be considered part of the whole. The very fact that we perceive evils as such attests to our lack of preparation (III.2.8, 15–16).

Many evils exist simply because of our choices: "But the wicked rule by the cowardice of the ruled; for this is just, and the opposite is not" (III.2.8, 51–52). Despite the many evils we see around us, therefore, we can conclude that Plotinus' arguments for the existence of Providence are based on three separate kinds of premises: (a) ethical, (b) ontological, and (c) noetic.

The ethical arguments are strictly arguments *quoadrios*. The fact that the One is the Good does not make Providence an extension of goodwill or of love. The objective of Intellect is to create according to rational laws and form, to produce the most beauty possible, and to achieve completeness. This was the position of the Stoics, and we have no reason to suppose that Plotinus differed with them substantially on this point. The ethical explanations connected with evils in this world are also of three kinds. (a) We choose the wrong thing.<sup>21</sup> (b) We are not sufficiently 'trained' or prepared to understand the 'evils' that befall us and others in an accepting and understanding frame of mind.<sup>22</sup> Both of these represent inappropriate attitudes which are neither moral nor good, attitudes which are not conducive to our well-being.

From the noetic or epistemological standpoint (c), we persist in misunderstanding the composition of the universe in all its aspects. We expect it to be all light when what it actually presents us with is an infinite variety of plays of light and shadow (III.2.11, 9–17). Therefore we need the sort of understanding that arises out of a different perspective (d), an understanding that is no longer particularized but global, one that is not centered upon our own problems or those of our friends and kin but rather on the admirably law-like regularities that are entailed by a rational forming of the universe. Finally, we must not demand “unmixed excellence” (e) (III.2.7, 2), but should only expect from the rational forming principle “as much as the mixture can receive” (III.2.7, 6–7).

Finally, the metaphysical-ontological reasons have to do with our understanding of the true nature of man. These considerations might also be subsumed under the heading of ‘epistemological reasons,’ but what is required is not a change in approach but a truer grasp of man’s nature. Thus man’s nature is not all of one piece (f): The “shadow of man” cries and moans for the external difficulties of life he encounters. But only the “seriously good part of man is capable of taking serious doings seriously; the rest of man is a toy” (III.2.15, 51–54). Cilento speaks of these passages as the most tragic ones in the *Enneads* and the most powerful commentaries Plotinus offers on the human condition.” And what are the ‘serious doings’ Plotinus is talking about? It seems clear that only our true well-being needs to be taken seriously: All else is play on a stage and childish games. Even death is simply the removal of the “play-costume in which he was dressed” (III.2.15, 57–58). Furthermore, all opposites are part of “the single rational living being” (g) (III.2.16, 48–49). They are often in conflict, since an absolute homogeneity of parts and actions does not make for a good play or an organism that is rationally put together. Unformed uniformity of matter does not manifest a rational plan, but “since it is a rational pattern it has distinctions in itself, and the extreme distinction is opposition” (III.2.16, 53–54). It is necessary to differentiate all throughout nature, for form and limit are better than their lack.” Difference in the highest degree is opposition and hostility.

This is to be expected in a universe that is far less of a Unity than its original Source and is a well-differentiated multiplicity instead. Had the universe been different, the rational principle might have been blamed for bringing about simply unformed, homogeneous parts, “parts all alike and equal” (III.2.1.2, 5–7).

#### 4. The Role of Freedom in Providence

In the tenth chapter, Plotinus once again takes up the problem of free will in relation to evil. If we have to accept the existence of evil in the world for the reasons cited above, is it the case that “men are unwillingly wicked” (III.2.10, 1–4) and that their wrongdoing is not their responsibility? Is the rational principle to blame instead? This is not the case, he says. Earlier in the treatise he had indicated, furthermore, that it is “neither pious nor reverent” to believe such a thing (III.2.7, 42–43). Human beings are not blameless and are not coerced by inflexibly predetermined principles: “men, too, are principles” (III.2.10, 19). Therefore their actions are their own, and they are responsible for them. Plotinus is rather brief here because ‘On Providence’ is a treatise meant to explain descending—rather than ascending—freedom. The focus of the argument is the necessary coexistence of good and evil in a universe brought about by the rational principle (Intellect)—thus by something that is good by definition.”

How does Plotinus manage to save freedom and moral responsibility while exonerating the rational principle from blame? In his clearest statement on this topic occurring in this chapter, he declares: “But as for the necessity, this does not mean that it comes in from outside but only that it is universally so” (III.2.10, 12–13). Thus it is not that the rational principle has erred; all it has done is to establish universal laws of which the amphibious nature of man is undoubtedly a part, so that man’s capacity to act and to do “noble actions by their own nature” and to be a free and independent principle (III.2.10, 19–21) is simply a manifestation of one of the laws that govern everything.

Even a rational principle is only able to produce such effects as the recipient matter is capable of accomplishing. Just as stones have a fixed nature that permits them to be shaped and formed, to roll whenever pushed, but not to walk or feel, and just as an animal’s nature permits it to move and feel and ‘choose’ according to instinctive desires, but not to philosophize, so too a human being is free to exercise and to enjoy his limited sort of freedom.

This freedom consists in part of a natural inclination to pursue the arduous, demanding task of achieving a much better sort of freedom through ascent.” The same sort of thing could be said of the laws governing the flow of a river: They are meant to keep the flow orderly and thus rational, thereby producing certain effects on its banks and in its bed, and also on the creatures on which it has an impact. It is possible,

however, for the river to react to specific environmental stimuli and overflow, thus producing 'evils' which its natural inclination would not cause, or to dry up because of extreme climatic conditions, which would have equally adverse effects. The laws upon which the operation of the river are based are rational, but the evil possibilities are universal in the sense that under the same circumstances or stimuli, any river would perform in the same manner.

Plotinus insists that it is not right to criticize, for to do so would be to demonstrate the same lack of comprehension that one might exhibit in criticizing a painter for not painting a picture that includes all of the best things he is able to paint and nothing else, or in criticizing someone for not producing a play that portrays static perfection rather than action, movement and a mixture of elements (III.2.11, 13–17). Therefore, although freedom is limited by universal laws, it is still present.

Another question remains to be explored: What about the freedom and rationality of the productive principle? Is it still represented through the multi-colored mosaic it produces? Can he still be understood as 'just'? Justice is manifested in two separate ways. First, one needs to adopt the timeless perspective fitting for an eternal Hypostasis such as Intellect or Soul. For instance, we need not judge the justice or injustice of a man's life simply by considering his present circumstances. Any evil he might suffer is surely either (a) part of his natural makeup, e.g. due to disease or death, or (b) the result of a wrong choice, e.g. not working hard enough to elect good rulers, or (c) retribution for misdeeds in past lives.

Once again the fault or responsibility is strictly ours. To think otherwise is simply to demonstrate a lack of understanding of how Infinite Freedom manifests itself. Our parts are prescribed for us in the universal play it designs, but our ability to carry them through in accordance with our talents—admittedly unequal—is due to ourselves alone (III.2.17, 26–33). If fact, our freedom to excel or to disgrace ourselves is much greater because of the universal magnitude of our 'play,' and also because of the basic differences we start out with (III.2.18, 1–3).

Freedom to express itself belongs to Intellect in much greater measure and, through it, to Soul, although we are liable to misunderstand this point because of our limited abilities. Both, however, are less than absolutely free, for both are 'constrained' by rational principles, unlike the One, who is supranoteic. Yet they enjoy a freedom that is not possible for us as complex human beings under the sway of a multitude of laws. We can indeed attain some measure of freedom through training and hard work,

but only for our very self, our inner core, which is subject only to the laws governing non-material entities.

In chapter 4, the second part of the treatise entitled 'On Providence,' Plotinus returns to the question of man's freedom in order to decide whether he is to blame for wrongdoing or not, even though his main aim in this treatise is to show that Intellect and Soul are to be absolved from all blame. He argues that if man were simple, in the sense of being subject to immutable laws in *all* his aspects, as plants and animals are, he would be no more to blame than they are. But he is to blame because "he is not only what he was made but has another, free principle" (III.2.4, 7), which many men do not elect to use, instead choosing "a number of others, the worse ones" (III.2.4, 15–16).

Therefore man has a different status than those other entities, a status that depends on his kinship with the One and freedom, rather than simply on his reception of the rational principle. In the latter regard he is like all of creation, for all things, in one degree or another, receive the rational principle to the extent that their nature is able to. It is the recognition and choice of rationality on man's part, however, that makes freedom possible.

An interesting question remains to be considered. The One is Freedom in an absolute sense and is under no constraint in relation to His free production. This multifaceted and complex world is what He creates, through Intellect (*nous*) and Soul. Why does He not create everything and everyone good? Plotinus answers: Should we blame the Maker just because plants do not feel, animals do not reason, and human beings are not gods? Just as we can and must accept diversity in the world around us, so we must also accept that people have different capacities to perfect themselves and to act for the good (III.2.3, 8–12). It is not as though the Creator of the world had set out to make all the entities in the world perfectly equal (III.2.3, 19–20). Plotinus does not come right out and say it, but the implication is clear: The universe is diverse and was meant to be such. Why should this be the case? First of all, that there is ranking is simply a fact of life. But the strongest consideration is that while the One is Freedom and Intellect is second (and Soul third), individual souls are followed by individual beings which are "not only souls but diminutions of souls," and thus represent "a kind of fading away as the living things move farther away from their origins" (III.2.3, 25–27).

This is clearly the principle reason for the status of the Universe and its controversial condition. Even the One, through Rational Principle and Intellect, could not deny His own uniqueness and supremacy through His creation. He is and remains the only One to be absolutely free; all else is

increasingly and progressively lower, thus possessing lower and lower levels of freedom. It is only man who has as much as the capacity for freedom through rationality. Thus, what we observe in the universe is unavoidable and rational, given the One's unique position. Any other form of creation would obscure the One's own 'nature' and role.

### 5. The 'Daimon' and Freedom

Plotinus devotes a short treatise to the 'daimon.' Are we to regard the existence of yet another superhuman influence on our lives as a further threat to freedom? Does the existence of daimons endanger our already precarious quest for freedom? On the contrary, Plotinus' *daimonia* help us understand why the upper soul is intrinsically inclined to seek freedom.

Other philosophers before Plotinus had grasped the unique nature of soul. Not just Thales but also Heraclitus had understood its depth: "You could not discover the limits of soul, even if you travelled by every path in order to do so; such is the depth of its meaning."<sup>29</sup> Heraclitus also anticipates the role of the demon: "Soul has its own inner law of growth."<sup>30</sup> Cilento says the following about the soul's destiny and nature: "Of this odyssey of the soul, who is the eternal nomad in the metaphysical realm, Plotinus is the last poet."<sup>31</sup> Why is the soul the 'eternal nomad'? Primarily because it is not totally tied to any predetermined state but is free to choose.

In this brief treatise, then, Plotinus explains why Providence's rational plans, which include the nature of the soul just as it is, do not preclude the possibility of human freedom but—on the contrary—require it. The notion of a daimon is alien to our present world-view, and those for whom this notion has meaning (mainly Christians and other religions) view demons as an evil, undesirable lot. For Plotinus, however, 'daimon' possesses a positive meaning, which emerges clearly from his treatment of the topic.<sup>32</sup>

In the title and body of *Enneads* III.4, Armstrong translates *daimon* as 'our allotted guardian spirit.' Cilento reserves the expression 'spirit' for Intellect, perhaps to distinguish it from the more laborious rationality of logos, or even to emphasize the spiritual component of the intellectual principle. He simply retains 'demone' (Italian for 'demon') for his own translation. Cilento also devotes one of his 'saggi' to the history and meaning of *daimonia*, tracing the notion from Homeric and even pre-Homeric times, beginning with Thales, for whom water and even "all" were "full of demons."<sup>33</sup> I will simply refer the reader to his rich and poetic

presentation of the history of 'demons' in Greece. Cilento maintains that with Plotinus we have arrived at the last stage of Greek demonology.

Plotinus begins his treatise by clearly outlining the difference between: (a) fixed, unmoving being and reality, (b) the coming to be and flux of the "expression of some realities" (III.4.1, 1–2), and (c) the restless position of the soul, poised between the two. Cilento characterizes the soul as "a bridge thrown between *Nous* [Intellect] and the world."<sup>34</sup> This 'bridge' is therefore like neither side. Its main characteristic is its ability to change—first of all from state to state, choosing a life that is mired only in the sensual, or the purely vegetative, or perhaps choosing a higher, intellectual way of life. Furthermore, it also moves from life to life, through a "multitude of gradations, values and changing forms," as Cilento puts it.<sup>35</sup>

After an exposition of Platonic doctrine, Plotinus goes on. It is not the daimon that chooses us; rather, we choose the daimon and thus bear the responsibility of our choice. Again and again, we will turn into the sort of creature we deserve to be because of our behaviour. In chapter 3 Plotinus picks up the thread of his own doctrine. We need to choose the daimon above us so that our efforts in this life will be compensated for by the status we achieve in the next life. Plotinus does not say that a daimon exists as separate hypostasis or entity of any sort; still, his description confers on it a "degree of spiritual life" and makes it the highest 'I' that spurs us on—a mythical reified version of man's perennial striving and restlessness for change.

Cilento says: "The demon, like history, is Freedom."<sup>36</sup> And so when we presume to judge Providence for the effects of the Rational Principle which governs the universe and gives it its laws, we first need to understand the power of freedom within the Principle. It is this freedom that permits us to go beyond the myth of the metals, allowing each one of us to choose the better daimon and higher life. The talents we need in order to reach a progressively higher level of spiritual life are just that—spiritual talents; they are primarily spiritual rather than intellectual, because our ultimate goal is freedom. And freedom, in its highest form, is supranoeitic.

### 6. Christian Providence and Evil

Contemporary philosophy of religion faces many of the same problems that plagued Plotinus, such as the conflict between the goodness

of God (and thus Providence, in its Christian meaning) and the existence of what some people have called 'surplus evils,' that is, certain evils which, according to them, cannot even partly be explained by pointing to human error and sinfulness. Even though some 'non-disciplinary evils' might eventually be understood as fostering other human goods, and perhaps as leading to greater strength and happiness in the human beings affected by them,<sup>2</sup> there remain many that appear far beyond any and all rational explanations.

When confronting the cases in which it does not appear that God cares in a personal way—or any other way—for every sparrow, philosophers are often at a loss. Some try to rethink and rework the concept of God in such a way that He retains a sort of Kantian goodwill while His omnipotence is temporarily or occasionally curtailed.<sup>3</sup> In this study I will not discuss these cases or otherwise attempt to deal with this problem. However, I do wonder whether these arguments do not surrender as much as they gain. Is the 'God' who emerges from such well-meaning conceptual manipulation still the God whom the Christian or an individual belonging to any of the great monotheistic religions would wish to worship?

I also wonder whether Plotinus' concept of Freedom as Absolute, combined with an acceptance of the existence of grades of life and reality, might not say as much in the face of the problem of evil as some of these contemporary thinkers manage to say. Plotinus' position saves more of the Unity and Integrity of his Principle than some Christian thinkers are able to do. (We should not suppose, however, that we was limited by some religious orthodoxy; he was committed only to the inner consistency and coherence of his own metaphysical doctrines and to the necessity of accounting for the existent realities he was acquainted with.)

Is there any sense in which the One or Intellect cares about what happens to us? Rist, addressing the subject of prayer, observes: "The One of Plotinus is transcendent and ultimately remote and unconcerned with transient things."<sup>4</sup> There is nothing in the textual work I have undertaken to suggest any other interpretation. Therefore we should not expect much in the way of concern—or even sympathy—from that Source. On the other hand, some sympathy may be available from other quarters.<sup>5</sup>

It is an important part of the Christian faith to believe that God is a loving Father whose function in regard to man is not limited to His role as Creator. The Christian is told: 'Ask, and ye shall be answered.' Parables attest to the power of prayer and supplication bolstered by faith, which is the prelude for the granting of favours and requests—and perhaps even for miracles that subvert that natural order of laws. Our hope—and sometimes

even our success in being granted what we ask for—is grounded in God's infinite love for us. Belief in these matters is central to being a Christian: faith, hope and charity are Christian virtues *par excellence*. Yet they are not to be found in Plotinus, with the possible exception of 'neoplatonic faith,' as Rist call it.<sup>6</sup>

What could Plotinus possibly mean by 'prayer,' then? What could it mean to pray to a Providence (or a God) who does not love men and cannot ultimately justify their hopes? In chapters 30 through 45 of *Enneads* IV.4, Plotinus distinguishes between two separate meanings of 'prayer.' The first one comes up in connection with his treatment of magic and cults, a domain of activity which he places below the realm of the World Soul. When prayer actually works, he argues, it is not because the gods hear and listen and react; rather, it succeeds because our action mobilizes the 'sympathetic' reaction of various parts of the organism we call the universe. We make these prayers, argues Plotinus, "to the sun and other men to the stars,"<sup>7</sup> and sometimes our wishes (whether good or bad) are granted. But how can a rational entity grant the wishes of an evil man? That this happens should not surprise us, says Plotinus, since both the good man and the evil man can draw water from the river. From this we see that natural bounties are available to all on an indiscriminate basis (IV.4.41, 15–17). Medicine, agriculture, rhetoric, and music all influence things and men to some degree. The first to help "natural things to be in a natural state" (IV.4.31, 17–19), whereas the latter two "influence the soul" and "lead men to better or worse by changing them" (IV.4.31, 21–23). The question is why this should be the case, and the answer we seek ought to be able to explain the effects of prayer and magic. In a lengthy discussion Plotinus considers and rejects various arguments and finally comes to the following conclusion: "This All is a 'single living being which encompasses all the living beings within it'; it has one soul which extends to all its parts, insofar as each individual thing is a part of it..."<sup>8</sup>

The whole universe is 'bound together' as one organism. What is felt by one part is felt by all, just as the pain in one finger is experienced by us as a general feeling (IV.4.32, 21–23). This whole 'organism' exhibits a "harmony of action and experience" (IV.4.33, 2–5). It possesses a great deal, and not just in the way of rational principles, for it also has an "unbounded store of varied powers" (IV.4.36, 1–2). These powers are somehow alerted or awakened by our prayers or magic. Therefore it is not the case that the gods or heavenly bodies are responsible for the effects of our prayers; rather, "the nature of what is done" is responsible (IV.4.38, 5–6). Hence, "magic spells work," according to Plotinus, "by sympathy

and by the fact that there is a natural concord of things that are alike and the opposition of things which are different" (IV.4.40, 1-4).<sup>2</sup>

This sort of prayer or magic is irrational, that is, not subject to rationality or deliberation. It is an 'enchantment' that affects "anything bodily," but "he himself" (i.e. a person's true self) would be unharmed (IV.4.43, 11-12). This enchantment is perhaps on a par with the enticement of the "care of children and concern for marriage" and with other activities such as "political activity and the pursuit of power." All of these are caused primarily by "our passionate spirit," and they "entice man since they give pleasure to their carnal desires" (IV.4.44, 7-12). We have come along way since Plato's *Republic* with its philosopher-king!

All of these lower 'enchantments' are contrasted with contemplation, pure and entirely self-directed, and of such a nature that "it alone remains incapable of enchantment" (IV.4.44, 1-3). It seems as though the good man has no need of this sort of prayer; it may even be the case that resort to it or to other 'magic' is a sure sign that one has not yet become either virtuous or free. The second sort of prayer is instead nothing more than a final 'waiting'; it is something we engage in when we attempt to reach for the One at the end of our journey of ascent: Alone to the Alone. It is not a prayer of request or petition; it is rather a prayer of silence, "...first invoking God himself, not in spoken words, but by stretching ourselves out with our soul into prayer to him..." (V.1.6, 10-12).

Therefore the usual Christian understanding of Providence as the work of a being to whom we can pray in the hope that love will come our way is not to be found in Plotinus, nor is the faith that our prayers will be heard and possibly even answered and that praying is a virtuous enterprise in itself. What he has in mind instead is a free but rational ordering of the universe, a virtuous goal which is conducive to our well-being but does not primarily involve an acquisition of traits or habits: Instead it is to be understood as a new becoming. It is the pursuit of immanent freedom, and it is based on a progressive detachment from everything that is not, or does not foster, the reunion of freedom in ourselves with Freedom itself.

Sympathy exists within various parts of the universe, and it manifests its interconnected wholeness and the powers we can summon from within it—provided we do not expect anything that might run counter to the providential laws that govern and direct us. Any care or concern that we would deem 'natural' is natural for Plotinus as well, but it is therefore to be dismissed, or controlled and—if possible—unlearned. It is a "passionate impulse" belonging to our "play costume," and not to our real self or to our serious work. The latter leads us to the One, but the One is

not a personal God, much less a Loving Agent.<sup>3</sup> It is simply not a nurturing or providing entity. It appears that the only one thing the One provides us with is a respect of a certain sort. He arranges effortlessly for cosmic laws subject to Intellect, but He allows us to retain our freedom, and thus also the kinship to Him that we need in order to ascend.

The term 'respect' is used by Plotinus himself and seems to capture the most that a good man is allowed to feel for his neighbour. For example, he says: "Since you can respect the soul in another, respect yourself" (V.1.2, 51).<sup>4</sup> It is also in the respect for our freedom that we find the main difference between the Stoic meaning of providence (*pronoia*) and the meaning Plotinus assigns it. The latter bases his interpretation of it on the addition to his universe of the One as beyond Intellect and thus beyond the rational principle of providence. Thus the metaphysics of Plotinus adds a new dimension to the universe envisioned by the Stoics, since our ultimate goal, in his view, is to go beyond Intellect, or at least to try to do so. And we should remember that the final step of the ascent is supranoeitic. When we consider the Stoic meaning of providence, then, we can clearly affirm that Plotinus does not hold the same view at all.

When we turn to the problem of the meaning of 'providence' in ordinary language, a meaning with an undeniably Christian flavour, we are equally far from the thought of Plotinus. The main reason for this is the emphasis on God's infinite love, a notion that would be even more anachronistic within the Plotinian context than the human love discussed earlier. Rist, who makes much of certain similarities between human *eros* in Plotinus and the Christian notion of *agape*, points out some differences: "The parable of Jesus, the writings of Paul and John, tell us the nature of *Agape*. *Agape* leaves the ninety-nine sheep in the wilderness to seek the one which is lost (Luke 15:4)."<sup>5</sup> What would Plotinus make of this parable? On the basis of the texts we have examined, we would have to say that his main concern would be for the justice of the case rather than for love shown to the lost individual. He tells us his own parable of the underdog, of those who are weaker, 'unprepared.' It would not be just, he says, for us to step in and save such people; in fact, it would be just if they were to be punished, even if those who triumph are the wicked (III.2.8, 16-26).<sup>6</sup>

Therefore, we must cast aside the limited perspective that would have us view all such cases as injustices (immediate injustices) instead we should take the longer-range view urged upon us by Plotinus: Providence will see to it that justice is served at some time—but not necessarily during our own time, or when we deem it appropriate. We cannot and need not

get involved, since it is our freedom alone that leads to the well-being that is our desired and natural aim.

All involvement with the human needs of others—and even with our own needs—is to be cast aside. As for prayers and other forms of magic, even if they are successful, they simply reaffirm our kinship with the rest of the universe; they do not bring us any closer to our well-being or to the One. It is only progressive freedom, which increases as many of our involvements decrease, that leads us to our goal. This freedom is not really in conflict with the rational laws of providence; it simply helps to clarify its reach and limitations. Perhaps this respectful freedom to choose to be what we can be is the highest sort of providing that man should wish for. In other words, it may be that we should think not in terms of a Christian love for the lowest, for the poorest, for sinners, but in terms of a transcendent 'toughlove' instead, to use a current expression. Such 'love' is all that human beings can expect, according to Plotinus. It may even be enough.

## 7. Conclusion: Freedom and Providence

Although individual human freedom is discussed in the two treatises on providence, the main thrust of the argument is intended to answer the two following questions. (a) How can free creation, which arises from the Good, retain the rationality of the principles according to which it operates when evil exists in the products of its creation? (b) Why is it that no blame for *what is* needs to be ascribed to the One or to other Hypostases? The defense of human freedom is also included, but the purpose of including it is to explain and defend the reach and limitations of rational universal laws and the possible conflict between freedom and necessity.

Another way to approach the problem of how to summarize Plotinus' teaching on providence is to look at it from the standpoint of freedom—in two senses. First let us consider the meaning of Providence against the background of the conflict between freedom and necessity; here the problem is one of global freedom. Against the same background, we could (secondly) raise the question of individual freedom. In both cases, the existence of evil is the catalyst. How can the existence of evil be rendered consistent with the One's creation as both free and good, and thus be uncoerced in respect to the evil that exists?

The first point (the global one) is answered by Plotinus as follows: all things are as good as it is possible for them to be. In other words, the

limits to the goodness of the things in the world do not result from any impotence in the One, who creates everything freely and spontaneously—and not according to any plan. On the contrary, in view of the fact that (1) the One is free, and that Intellectual Principle and the soul are second and third and so on, everything else has to manifest a progressively fading unity, freedom and goodness. The existence of levels and grades emanating from the centre like rays from the sun, each one weaker than the one before as the high power and concentration of light recedes, simply follows from the primacy of the One and is necessitated by His status within the universe. It is not an evil choice, then, that makes Alaska less warm and sunny than the countries through which the Equator passes.

Secondly, there is no conflict between universal necessity and absolute freedom in the One. The conflict that appears to be present is resolved once we realize that the One's free and spontaneous creation in the Good engenders just Intellect, the Intellectual Principle. Therefore the rest of the universe, including Soul and our own souls, is under the sway of rational laws. Freedom is retained through the creative process, for contemplation and freedom are one. Hence the 'self' is always There, maintaining and preserving this higher element even in its fall. After all, the higher element is what inclines the self to reascend to its 'true self' and to its Father and Country once again. Therefore, through freedom the two main difficulties that arise with regard to Providence's universal aspects can be solved.

And what about Providence considered from the individual standpoint? How are souls to be good and bad, and how can men be moral agents (and therefore necessarily free) while they are under the sway of immutable laws? Are we free, or are we coerced by those laws? We have just noted that the self remains akin to the One (Freedom) and longs to reascend. We also saw earlier that the self is a principle, and as such is free. It is clear that the self, since it is immaterial, aloof and free, is under the control of no law, for freedom and the limits of an essence (the rational form) cannot mix. However, the rest of our soul, and the composite that is humanity, are indeed governed by universal fixed laws. This is the reason why our instincts, for example, are no more blameworthy than those of animals. But there is more to us than this aspect, and it is precisely the other aspect, which is akin to the highest (and not just akin to Intellect) that makes our individual action free and thus enables us to retain our moral responsibility. Our responsibility extends even beyond our life. For the rationality of Providence ensures that good is rewarded

and evil is punished—if not in this life, then in the future. The section on the 'daimon' also makes this point forcefully: We must freely choose ■ higher life. Justice prevails throughout the universe, as is reasonable.

And so we see again that when the role and nature of freedom are kept clearly in mind (at least to the extent that such an open-ended notion permits clarity), the apparent contradictions in Plotinus' conception of Providence are resolved. What remains is a coherent and consistent doctrine.

46. Plotinus here tells the tale of tough, well-trained boys who are "inferior in soul" to those they beat in a match, and whom they then rob of "their food and their dainty clothes". He asks: "is this anything but a joke?" It is the "good boys" fault that they allowed themselves to become weak and soft, through laziness. It is right not to interfere.

## THE NOTION OF BEAUTY IN THE STRUCTURE OF THE UNIVERSE: PYTHAGOREAN INFLUENCES ON PLOTINUS

Aphrodite Alexandrakis

The aim of this paper is two-fold. First, I will attempt to set forth the aesthetic terms and principles involved in the Pythagorean theory of the construction of the universe. I shall discuss the two central Pythagorean concepts of harmony and symmetry and their relationship to beauty as well as to the Pythagorean mathematical model of the universe. This analysis will establish the importance of harmony and symmetry in the Pythagorean system. Secondly, I shall trace the Pythagorean influence on Plotinus' conception of the cosmos as a harmonious whole and his concern with World Harmony. On the basis of this discussion, I shall argue that the concept of beauty played a fundamental role in both the Pythagorean and the Plotinian models of the structure of the universe.

While it is true that the Pythagoreans did not pursue "aesthetics as an independent science,"<sup>1</sup> their interest in beauty is reflected in their study and analysis of aesthetic elements. The fact that they did not give a name to the study of aesthetic elements—such as harmony, rhythm, and symmetry—does not mean that they did not think of beauty as such. In fact, for the Pythagoreans harmony *is* beauty, and beauty arises from proportion (*symmetria*).<sup>2</sup>

### I

The Pythagorean theory of the universe rests on the basic premise that the world is constructed mathematically. According to Aristotle, the Pythagoreans thought that the principles of mathematics were "the principles of all things."<sup>3</sup> They conceived of the universe as "a musical scale and a number." They arrived at their theory through a recognition

of the numerical properties in all things.<sup>1</sup> Furthermore, they observed empirically that the properties and ratios of harmonious musical scales depend upon numbers.<sup>2</sup> The cosmic significance that the Pythagoreans attributed to number arose from their attempt to "discern cosmos within chaos."<sup>3</sup> The term *kosmos* (cosmos) suggests order and the main characteristic of order is measure. Measure leads to balance, which implies proportion (*symmetria*). The concepts of order and proportion are thus deeply aligned with the concept of harmony in the Pythagorean model of the universe.

In the Pythagorean system, the Cosmic structure was conceived as a sphere consisting of a central fire surrounded by Counterearth, Earth, Moon, Sun, the five planets, and "the outer sphere of the universe which carried the fixed stars."<sup>4</sup> According to this Philolaic structure, ten bodies are moving in ten orbits around the central fire.<sup>5</sup> According to Philolaus' fragments—which are the only direct sources of Pythagorean philosophy—Pythagoras conceived of a universal harmony produced by the movements of the planets. In their movements the planets followed a geometric pattern, an astronomical order "conceived both geometrically and musically."<sup>6</sup> This structure is the basis for the doctrine of the *Music of the Spheres* in which, according to Aristotle,

...the movement of the stars produces a harmony, i.e. the sounds they make are concordant..."

And, as Plato says,

...as the eyes are framed for astronomy, so the ears are framed for the movements of harmony."

The Pythagorean belief that "the whole heaven is harmony and number" is expressed by Philolaus:

Since the principles or origins [*archai*], namely, those from which the world order was formed, the limited and unlimited in numbers, as the odd and even, were not similar nor of the same kind, it would have been improbable for them to be set in order, if there had not supervened a fitting together [*harmonia*]. It was necessary that they be fastened together by an *harmonia* such that by it they could be held together in order."

As indicated in the above passage, the term *harmonia* has more than one definition. On the one hand, it means a 'fitting together';<sup>7</sup> on the other

hand, it describes a mathematical relation. For Pythagoras, according to Aristotle, "the attributes of numbers are present in a musical scale and in the heavens and in many other things."<sup>8</sup> In Pythagorean thought the notion that the universe consisted of numbers, and that numbers are tied up with harmony, is the foundation of the harmonic conception of the universe. The Pythagoreans observed a musical harmony in the stars and in their movement. This harmonic conception of the universe was connected to the musical scale which they referred to as an 'harmony.' Philolaus explains the intervals of the musical scale in terms of ratios: 1:2 [the octave]; 3:2 [the fifth]; and 4:3 [the fourth]. This proportional theory was based on the observation of vibrating strings. According to Philolaus, "these ratios are the fundamental principles of cosmic order."<sup>9</sup> Thus, harmony takes on a 'scientific' character. As a result, the Pythagorean cosmology was based on harmonic relationships contained in the Tetractys or the Decad—which represents the totality of mathematical order, for as Aristotle says: "It symbolizes the 'elements of number' which are the elements of all things."<sup>10</sup> The Tetractys has been described as the discovery

of the chief musical intervals, the octave, fourth, and fifth, expressed as the numerical ratios 2:1, 4:3, 3:2, of the fact that the first four integers add up to ten, and that the diagonal of the square is incommensurable with its side."

The Tetractys has been identified by Iamblicus with the cosmic harmony, and was called by Plutarch 'cosmos', 'Heaven' (*ouranos*), and 'All' (*pan*).<sup>11</sup> Thus, harmony brings together and puts in a certain order the 'mixed elements' of the universe. The Pythagorean principles of the limited and the unlimited are "combined by a harmonic process"<sup>12</sup> of a metaphysical nature. The result is an orderly, harmonious universe, founded on a structure of numbers. The Tetractys or Decad, was conceived as divine and perfect—"containing all things in itself"—and it was "the focus of a positively religious veneration."<sup>13</sup>

## II

In addition to the concept of *harmony*, the concept of *symmetry* was of great importance to the Pythagoreans. Symmetry seems to be the result of the order which exists in the Pythagorean cosmos. Plato, whose

Pythagorean influence is apparent, confirms the importance of measure and symmetry in beauty.<sup>22</sup> He says:

...any compound, whatever it be, that does not by some means or other exhibit measure and proportion, is the ruin both of its ingredients and, first and foremost, of itself.<sup>23</sup>

As J. J. Pollit points out, order cannot be conceived without measure—"which involves both definition [marking the boundaries of things] and analysis of the interrelationships of discrete forms."<sup>24</sup> In fact, for Plato, "it is precisely by this effort they make to maintain the due measure that they achieve effectiveness and beauty in all that they produce."<sup>25</sup>

Plato's definition of order (*taxis*) is clearly rooted in the Pythagorean theory. For him, order refers to "how correctly is the object produced"<sup>26</sup> or, in other words, how correctly its parts are arranged.<sup>27</sup> Indeed, he goes even further to suggest that measure and beauty are identical.<sup>28</sup>

### III

In contrast to Plato and the Pythagoreans, Plotinus *rejects* symmetry as a component of beauty.<sup>29</sup> Beauty, for Plotinus, is not found in the symmetrical parts of the object: The One is Beauty (*kallos*), and the One has no parts.<sup>30</sup> Plotinus' One stands for 'zero' (null), or what Scotus Eriugena calls 'Nothing'<sup>31</sup>—that is, the negation of multiplicity in the nature of the One. It is interesting, however, to note that in discussing the One's singular nature, Plotinus refers to the Pythagoreans: "...the Pythagoreans symbolically indicated it to each other by the name of 'Apollo'..."<sup>32</sup> The word 'Apollo' derives from *a-* ['not'] and *pollon* ['of many']. Plotinus' comment indicates his knowledge of and interest in Pythagorean theory.

Plotinus prefers to use the concept of harmony rather than symmetry in his description of the universe. In his view, the universe consists of a rational principle out of which springs "the battle of conflicting elements."<sup>33</sup> He refers to the World Harmony as the result of 'adverse elements'—akin (*syggene*) and opposed (*enandia*). He compares the rational principle of the universe to the plot of a play: There is warfare (*polemos*) and strife (*machē*) in the world, just as there are conflicts in the play whose plot is one. When these conflicts are brought together into one

*harmonia*, then the play is a harmonious whole. In music, as well, melody "results from the conflicting sounds." What Plotinus has in mind here is the Pythagorean combination of higher and lower sounds into an *harmonia*. He discusses how the high and low (*oxy kai vare*) sounds "come together into a unity into the melody itself..." (*syniasin eis en, ondes harmonias logoi...*).<sup>34</sup> The oneness of reason, or of the universe, is the result of the combining of different and opposite elements—such as "white-black, hot-cold, winged-wingless."<sup>35</sup> Like the Pythagoreans, Plotinus extends the notion of *harmonia* to its mystical significance. He refers to the person whose prayers do not reach the heavenly bodies directly but through and because of the presence of an *harmonia* which brings them together.<sup>36</sup> He further compares the World Harmony to the vibration which passes from one lyre to another in so far as *harmonia* exists.

### IV

For the Pythagoreans, harmony is the core of mathematics, music, and their components: symmetry, order, and measure. Consequently, harmony is an aesthetic, scientific, metaphysical, and practical notion.<sup>37</sup> Although there is no use of the term 'beauty' in Pythagoras' theory, it is likely that the Pythagoreans "employed rather the term 'harmony' in place of beauty."<sup>38</sup> Hence, the scientific and religious "character of the Pythagorean movement is reflected in its aesthetics."<sup>39</sup>

Finally, according to Philolaus, it is the presence of *harmonia* which puts in order the causes (*archai*), that is, the principles of the limiting and the unlimited. As a result, harmony, or beauty, takes on a metaphysical aspect which Plato called the 'Idea of Beauty.' The order—the perfect structure and appearance of the planets and the heavenly bodies—results in beauty. Plotinus' notion of harmony, which acts as a 'peace-maker,' a complete serene whole, and a principle of measure, is of Pythagorean origin. He considers *harmonia* from the metaphysical and the aesthetic point of view. It is through *harmonia* that the 'akin' and 'opposing' elements return and unite in order to form the World Harmony. Similarly, the return to the One is the return to humanity's harmonious origin. Both Pythagorean and Plotinian thought are directed towards an ordered rational system: the Tetractys and the One. The Tetractys is a complete, harmonic whole, but it consists of parts. Plotinus' One is a complete, harmonious

whole, without parts. The One is Beauty. The One is the principle of measure itself.<sup>a</sup> The One is Harmony.

# THE ONE: SUBSTANCE OR FUNCTION?

Reiner Schürmann

When metaphysicians speak of a supreme being, they call it 'the Good,' 'the Beautiful,' 'Truth,' or 'the One.' Each of these epithets results from a definite human experience, leading to a specific cognitive interest under which that being is considered. It appears as the Good insofar as man's desire for irrevocable possession finds rest in it.<sup>1</sup> It appears as the Beautiful since it orders all things into a cosmos, an order that can be mastered by reason.<sup>2</sup> It is the Truth, for it is known by the mind's return upon itself.<sup>3</sup> Each of these three points of view thus corresponds to a given human interest: appropriation, domination, and reflection. But in virtue of what interest, what intellectual temperament, do metaphysicians call the supreme being 'the One'? I wish to suggest that the *one (to on)*, at least according to a few decisive texts by Plotinus, is not primarily to be understood as a predicate of the supreme being, nor of any being. If *metaphysics* is the doctrine of the nature of things and of their ultimate grounding, then a discourse about the One, *henology*, has overcome metaphysics. If the One is not the supreme noumenon, its 'nature' will have to be discovered in the way it functions among phenomena. It will be 'the First' only as the ordering factor of beings and their constellations. It will not function as ground—neither of things, nor of our knowledge of them.

## 1. Negative Henology versus Negative Theology

The One is not a being, not something. This is clearly implied in the first lines of Plotinus' treatise 'On the One': "It is due to the One that all beings are beings."<sup>4</sup> Why can the One not be called 'something,' a being? "The One is in all respects the First, but mind, as well as the ideas *and being* are not first."<sup>5</sup> The derivative status of *being* is a consequence of its chief quality, intelligibility. All that there is, all that exists, can be understood. But the One is beyond the reach of intellection. Hence it is

not a being. Conversely, *being* is secondary since it is of the same order as mind (*nous*) and the ideas.

Plotinus' denial of knowability and being in the One amounts to turning Plato against himself. With Plato, he holds that *to be* is to be intelligible. But against Plato, he discovers that when we speak of things intelligible we always speak of things manifold, be it only of the duality of knower and known. And what is manifold, what implies otherness, cannot be the First. Mind and Being are derivative because they are intrinsically manifold. This is why, in the Plotinian universe, no being can claim ultimacy. Thus, if it is due to the One that all beings are beings, the One is not itself to be found among them. It is 'non-being.'<sup>6</sup> Here, then, the phrase 'supreme being' would be a contradiction in terms.

It may be all too rash to read the statements quoted, and others like them, as a negative discourse about a divine First—as negative theology. Such is the received opinion about the Neoplatonists: Since the One ranks beyond mind and being, it is 'higher' than these. Its simplicity makes it unknowable to us, but also supreme. The distinction between the One and intelligible Being has led to a few equations for which one would find ample support in the Neoplatonist corpus, both Christian and non-Christian: To be one is to be *inconceivably* actual, spiritual, changeless, powerful, causative, eternal. Thus the One remains something after all. Only, according to what could be called a metaphysics of radical transcendence, it is beyond our reach—being beyond Being, mind beyond mind, cause beyond cause. Despite its apophatism, the discourse of this so-called emanationist metaphysics remains squarely onto-theological, a discourse about being 'as such' which seeks its legitimation in 'a' being that is supreme and divine, although beyond our grasp.

By his distinction between the One and *being*, Plotinus disrupts onto-theology understood in this fashion. He retrieves a characteristic of *being* that has been lost under the predominance of onto-theology since Plato. The English participle 'being', just as the Greek '*on*' (*one*), contains an ambiguity. A participle is that grammatical form which 'participates' in both noun and verb. *On*, or the archaic *eon*, is an essentially equivocal concept. About this equivocality, Heidegger writes: "*On* says 'being' in the sense of *to be* a being; at the same time it names *a being* which is. In the duality of the participial significance of *on* the distinction between 'to be' and 'a being' lies concealed."<sup>7</sup> In Plotinus, it is clear that *on* is a noun. But as such it is precisely derivative. As 'a being' it is not the First. Heidegger thinks that the 'verb' connotation of the participle *on* has been

obscured since Plato by the identification between nominal *on* and the supreme being.

The distinction between One and *being* in Plotinus makes it impossible to reduce the First to nominal being—substance (*ousia*), as he also says.<sup>8</sup> The *on* assuredly is God (*theos*)<sup>9</sup> for him. But Plotinus' onto-theology is his penultimate word, so to speak. It is not his last word. It has to be distinguished from his henology as the second hypostasis, *Noûs* (Intellect, Mind), is from the first hypostasis, *Hen* (the One). Plotinus has seen that any onto-theological discourse about the One necessarily commits the metaphysical fallacy of treating what is First as a being; or what is ultimate, as a substance.

Against the Platonic and Aristotelian metaphysics of form, Plotinus holds that it is *not* due to their substantial form that all beings are beings: "It is due to the One that all beings are beings." The metaphysical difference in both Plato and Aristotle between *substance* (whether divine or sensible) and *being* is displaced in Plotinus. He conceives a henological difference between the *One* and *being*. Since the One is non-being—*mē on*—we had better speak of negative henology.<sup>10</sup> It has to be 'negative' since *logos* constitutes the thresholds between the hypostases and is for that very reason subsequent to the One. In negative henology, the ontological difference is between One and *being*, or between *non-being* and *being*.

## 2. Metaphysical and Henological Difference

Negative henology achieves what negative theology can never achieve, namely, an understanding of the difference between *non-being* and *being* as the difference between the verbal and the nominal participle—between 'to be' and 'a being.' The One differs from Mind as a process or an event differs from the noun. Plotinus himself never equates *to hen* with *to einai*. In a later Neoplatonist, however, we read these lines:

The One that is beyond substance (*ousia*) and beyond being (*ontos*) is neither being, nor substance, nor act, but rather it acts and is itself pure acting, so that it is itself 'the to be' (*to einai*), that which is prior to being (*ontos*).

The editor of this striking text first attributed it to Porphyry, and later to the 'Anonymous of Turino.'<sup>11</sup> The One here is not only called 'pure acting' and is thereby desubstantialized, but it is also identified with the verb 'to

be.' Here the ontological difference between the first and the second hypostases is clearly expressed as the difference between 'to be' and 'a being'; between the indeterminate or pure 'is' and the determinate sum of all beings; between the verbal and the nominal participle.

This desubstantialized notion of the One designates no transcendent reality—no thing—and in that sense, nothing. The 'verbal' understanding of the One is also irreducible to the later Scholastic notions of *ipsum esse subsistens* and *actus essendi*. Although these notions rehabilitate the infinitive in the ontological discourse, the verb there serves to express the principle of intelligibility, which is the Neoplatonic *second* hypostasis.

We thus have to distinguish between two versions of the ontological difference. Because of the sweeping influence that Aristotle's *Physics*—"the hidden foundational book of Western philosophy"<sup>20</sup>—has had over the tradition, the terms of the ontological difference have remained confined to problems connected with fabrication. Metaphysicians have not 'forgotten' the ontological difference, but, at least within the Aristotelian tradition, it has remained a physicalist difference. Its discovery was altogether linked to the question of technique: How to produce a universal *being* or form (*eidos*) in individual matter. Thus the terms of the historically predominant concept of difference have been: *ousia* and *on*, *entitas* and *ens*, or, in Heidegger's language, *die Seiendheit* ('beingness') and *das Seiende* ('beings'). This is the *metaphysical* difference. It has imposed itself upon reflection through the observation of physical change. For Plotinus, it constitutes the realm of mind. "The first substance," that is, Mind (*Noûs*), he writes, "has all things and is all things."<sup>21</sup> With the physicalist-metaphysical difference, we are in the realm of onto-theology: the substantiality of things—*ousia*—is treated as an entity, as the hypostatic mind, as a God.

Both Plotinus and Heidegger take a step backwards from this metaphysical difference between substantiality and things to the 'One' or to 'being' understood verbally. What appears with this step can be called the *phenomenological* difference, which is of another kind than the metaphysical difference between a thing and its substantiality. The phenomenological difference secures no transcendent most-real ground; it amounts only to a transcendental condition for the appearance of phenomena. Plotinus' phenomenological difference between the One and substantial *being* shares, as we shall see, the chief feature of Heidegger's phenomenological difference between *to-be* and substantial *being*, namely, the character of event. These separate steps, 1) from *ousia*, or 'beingness,' to *einai*, or 'to be,' and 2) from *on* or *onta* ('beings') to *ousia* ('beingness')

are heterogeneous. Their heterogeneity is completely lost when the One is called *hyper-on*, 'a being beyond being,' as in later Neoplatonists.

One of the most revealing treatments of the relation between the One and *being* is found in Plotinus' commentary on Plato's *Parmenides*. Plotinus there equates each of Plato's hypotheses with one of the three hypostases. The first hypothesis is, 'the One is one.' In Plotinus, it is said to correspond to absolute unity, the primordial One.<sup>22</sup> 'The One is one' amounts to saying that we cannot speak of it because we cannot treat it as an entity. On the other hand, the proposition, 'the One is,' which corresponds to the hypostatic Mind, expresses a unity of many entities.

Whatever has existence and *is*, is by that fact determined numerically...[In the second hypostasis] this multiplicity is seized as a unity; to be utter multiplicity is denied of it, it is unit-multiple. Therefore it ranks below the One, since it possesses multiplicity.<sup>23</sup>

The Mind is the unity of all intelligibles, the first substance, and as such the beingness of all beings. The argument for breaking up the identification between the One and the supreme being rests not on the distinction between the universal and the particular, but on that between unity and multiplicity. *Ousia* or 'beingness' is a derived unity because it comprises multiplicity. Consequently, substantial *being* cannot in any way be predicated of the One.

The full ontological difference, embracing both the metaphysical ground and the phenomenological condition of possibility, thus unites three terms. In Plotinus they are 'beings, substance, One.' In his fourth century disciple, they are 'beings, substance, to-be.' In Heidegger they receive several descriptions: 'beings, beingness, to-be' or 'things present, their presence, presencing' (*das Anwesende, die Anwesenheit, das Anwesen*), or 'things manifest, their manifestness, manifestation' (*das Offenbare, die Offenbarkeit, das Offenbaren*).<sup>24</sup> In each of these descriptions, the third term is a verb: to be, to presence, to manifest.

To point out these parallels concerning the ontological difference in Plotinus and Heidegger is not to claim that the former was a phenomenologist of *being* or that the latter was a negative henologist. Heidegger wanted to convey the impression that he was barely acquainted with the *Enneads*.<sup>25</sup> But his understanding of the ontological difference, uniting three heterogeneous terms, is helpful in showing how negative henology overcomes metaphysics insofar as metaphysics is conceived as the quest for a most-real ground on which knowledge can find certitude—and life, peace. It is the verbal sense of *on* which shows all

substantive notions of the First to be derivative. The verbal participle *on*, Heidegger writes, obviously echoing Plotinus, "indicates what is purely and simply singular, what in its unity is unique and, as unique, is the unifying One before all number."<sup>2</sup>

### 3. The 'One' as Event

The One, both as no-thing (*mē on*) and as the to-be (*to einai*) is best described as event. It repels any notion of substantiality; hence we cannot say that it does something, that it acts. Unifying is not its act in the sense that thinking and speaking are the acts of a human substance or agent. And yet, the One is what unifies each thing as well as each order of things: "Deprived of unity, a thing ceases to be what it is called: no army, unless a unity. A chorus, ■ flock must be one thing. Even house and ship demand unity, one house, one ship; unity gone, neither remains."<sup>3</sup> Unification is not the act of the One, but the One *is* altogether unification; *hen* is *henōsis*.<sup>4</sup> Plotinus never calls the One a hypostasis. The example of the army in movement, borrowed from Aristotle, illustrates his concept of the One as pure function. An *archē*, principle, is nothing in itself, it is mere ordering—"like a rout in battle," Aristotle writes, "stopped by first one man making a stand and then another, until the original formation has been restored."<sup>5</sup> It is through this line of argument that we have to understand the One. Plotinus calls it 'the principle of being' (*archēontos*).<sup>6</sup> As a function, as the differentiating principle among things, "the First is present without any coming and, while it is nowhere, there is nothing where it is not."<sup>7</sup> This is to say, the One is the factor of coordination in all things without which all would disintegrate. It is their pure constellation, uniting bricks into a house, soldiers into an army, cities into an empire. But far from being the epitome of power, as the modality of phenomenal interaction it is most inconspicuous.

Here again, the alliance between metaphysical apophatism and onto-theology obscures the phenomenological discovery contained in negative henology. This discovery can now be stated in a paraphrase of the initial quote from the *Enneads*: It is due to unification—to their entrance into an order of interconnectedness that all beings are beings. In negative theology, on the contrary, we hear that the One is the supreme being, of which we do not know *what* it is, although we know *that* it is. But if the One as *henōsis* is a resurgence of the verb-connotation of the participle, then we can think, although not know, what it is—we can think its nature:

It is the very movement of *nasci*, or *phyein*, of coming-to-presence, in all that there is. It is the *phainesthai*, the appearance as such, in all phenomena. It is their origin in the sense of pure *oriri*, showing-forth. These verbs, *nasci*, *phyein*, *phainesthai*, *oriri*—and although the two Greek ones are not central to the Plotinian terminology—indicate nevertheless how the One is an event. It is the event by which any phenomenon whatsoever enters into a constellation, an economy of presence. These terms also indicate how we have to understand the apophatic negations in Plotinus: the One has no 'form', he says, no 'substance', no 'this' (*tode ti*), and "even this name, the One, contains no more than the negation of plurality." To speak of it, he adds, it might be more appropriate to use "the symbol Apollo," composed of the privative 'a-' and 'pollōn' ('of many'). All these negations are meant to discourage us from conceiving the One as position, as *thesis*.<sup>8</sup> They should also discourage us from conceiving it as simply a more intense mode of *being* than anything we experience phenomenally.

The difficulty in understanding the radically non-metaphysical notion of the One stems primarily from the difficulty of separating it from causal representations. The One assigns all things their locus, their site, in a given economy of presence. It does so, however, not as a demiurge (and even less as a creator), but as a principle, *archē*—this term understood as the mere function by which things present enter into commerce, as the coming about of their mutual rapport. It is true that in Neoplatonism causality is exclusively 'descending.' There is no ascending efficacy of sensible things upon intelligible things. But how can the One be called a cause? "It is cause of the cause" which is the Mind. It gives the second hypostasis (*Noūs*) its orientation so that the Mind's causality is actively unifying. But the One is not active, no more than a geometrical law is active when three lines enter into a certain relation so as to form a triangle. The Mind, the active fullness of reality, is thus immediately unified, but is only mediately unifying. According to received imagery, the One imparts an 'upward' direction to all causes, the *epistrophē* or return. It also imparts to them a 'downward' direction, the *proodos*, or process. It orders substance back to its source and ahead towards appearance. Only as this directionality of substance can the One be called "what is most causative and the true cause."<sup>9</sup>

For this entire set of premises—the One as factor of unification; as denoted by the verb 'being' and not as supreme entity denoted by the noun 'being'; as directionality of phenomena and not as their efficient cause—I find no better term than Heidegger's notion of *Ereignis*, 'event of

appropriation." Again, I am not claiming that it is from Plotinus's *hen* or *henōsis* that Heidegger has worked out this concept, nor am I saying in this context that Plotinus sheds light on the later Heidegger (although that would be a consequence of my claim). Rather, my point is that the later Heidegger is useful for understanding Plotinus. Indeed, one can identify a line of authors whose thinking has remained on the margins of metaphysics precisely because they attempted to retrieve a 'verbal,' non-substantialist, understanding of being. This line would go from Plotinus' 'unification' to Meister Eckhart's 'ground,' to Schelling's 'longing' in all beings to break out of darkness into manifestation, to Heidegger's *Ereignis*.

The 'firstness' of the One remains incomprehensible in terms of efficient, formal, final or material causality." The One can be called the universal 'cause' only insofar as it imposes the directionality of process and return upon all things intelligible and sensible. Since the entire vocabulary of cause is inadequate for an account of the One, negative henology revealed itself to be irreducible to negative theology. Moreover, the difference between the One and *being* is irreducible to the metaphysical difference. The One is the directionality of all things. As such, it is primordial time.

#### 4. Primordial Time

Does the notion of *Ereignis* allow one to raise the question—heretical within the tradition of Neoplatonism—of the temporality of the One? Before seeing how far one can go in temporalizing the One, it may be useful to recall briefly the three decisive moments in the Western philosophies of time. We will then be able to place henology within that framework.

The first of these moments results from the chief experience that strikes the Greek mind in the classical age, namely, the experience of change effected by man. Substantial motion as it occurs in sculpting, building, and so forth, received its theory in Aristotle's *Physics*. Correspondingly, the classical notion of time has to do with movement: "Time is the number of movement according to a before and an after."<sup>28</sup> Without motion no time could be represented. Only through the sequence of individual moments in becoming do we reach concepts such as 'before' and 'after.' Even if the soul experiences such a movement in its own life, this concept of time is worked out from the phenomenal domain of

material transformation. In Heidegger's words, "the Aristotelian interpretation of motion was the most difficult task for thinking in the entire history of Western metaphysics."<sup>29</sup> Since this classical concept of time is derived from physical change, time cannot occur outside the world of sensible substances.

The second moment is one of interiorization. It is most evident in Augustine. To be sure, Augustine knows the concept of time that arises from the observation of change. Following Aristotle, he expresses this as numbering the 'mutations' of forms in matter." But with Augustine the locus of our experience of time shifts from manual production to the life of the mind. The soul itself appears to him as stretched out between past and future: "It seemed to me that time is nothing else than extendedness; but of what sort of thing, I do not know; and it would be surprising if it were not an extendedness of the mind itself." In much the same fashion as Aristotle's physicalist concept of time, this mentalist notion, too, applies only to the earthly world of change. Eternity is entirely beyond time. In eternity there is no alteration. Change is the essence of time," which is therefore not simple: "Time is threefold, namely the present of things past, the present of things present, and the present of things to come."<sup>30</sup>

The third moment in this history of Western thinking about time is Heidegger's discovery of ecstatic temporality. This notion can, in a way, still be viewed as an offspring of the Augustinian *distentio animi*." However, it breaks with that entire tradition in the following ways: The ecstases by which human existence 'steps out of itself' into past, present and future replace the representation of a linear time-flux; the preeminence of the future replaces the traditional primacy of the present; and the three co-originary, 'equiprimordial,' dimensions of time replace the construction of past and future as prolongations of the present. In the metaphysical tradition up to and including Husserl, these elements—the linear sequence of 'now-moments,' the origination of the stream from the *present*, and the genesis of past and future by acts akin to *protention* and *retention*—form a system.

To these historical points of juncture two more must be added, both of which occur in the development of Heidegger's writings. He described the first of these breaks as the transition from time as 'the sense of being' to time as the history of 'the truth of being.'"<sup>31</sup> This break constitutes what he called 'the turning' in his thinking. It results from the discovery that being-in-the-world is not the neutral structure it appears to be in *Being and Time*, but that it has itself a history, which Heidegger calls the 'history of being.' There are the Greek, Roman, Medieval, modern and contemporary

modes of being-in-the-world. Thus ecstatic temporality turns into epochal temporality. The continuity with the existential analytic is nonetheless striking. An epoch, a sudden instauration of a constellation of presencing and absencing, in *alāheia* (truth), unites the three dimensions of time in a *non-linear* upsurge of a phenomenal arrangement that will hold for awhile. Furthermore, since it is the advent of such a new arrangement of things, the epoch is *future-directed*. Lastly, as the phenomenal origin of past, present and future, the epoch unites these dimensions *equiprimordially*. Thus from ecstatic to epochal temporality the basic features in Heidegger's new understanding of time remain preserved, although they become historicized.

The other break is described by Heidegger as the transition from 'the truth of being' to 'the topology of being.'<sup>36</sup> With this last stage in the reflection about time the primordial condition of all previous notions has been reached. Time here is the 'sense' of *being* inasmuch as *being* 'assigns' to all phenomena their site or their place in any given constellation of presencing and absencing. Such assigning must not be misconstrued as referring to any mythical agency. It is nothing but the entrance of beings into an order. This entrance, for which Heidegger also has recourse to such traditional terms as *phyein*, coming-forth, and *phainesthai*, appearing, is what the term *Ereignis* is meant to capture. It may indeed be most suitably translated as 'event of appropriation'; but there is no agent, human or otherwise, who appropriates things, who makes them his own. Nor does the 'proper' (*eigen*) suggest a metaphysic of full presence. Rather it points to the way things belong to one another in any given order, the movement by which they enter into mutual propinquity. Quite as in ecstatic and epochal temporality, it is the *Sinn* as directionality ('sense', not 'meaning') that is at stake here. The directionality of time is, however, no longer understood in relation to either man or history, but merely in relation to presence and absence. It is understood as the emergence from absence into presence.

It should be clear in what way the last phase of Heidegger's thinking remains indebted to the transcendental tradition. Time as 'event' makes possible ecstatic as well as epochal temporality.<sup>37</sup> However, in Heidegger, transcendentalism is divorced from the typically modern preoccupation with subjectivity. The event is primordial time, operative 'always already' in lived time and rendering possible all transmitted concepts of time, be they physicalist or mentalist.

### 5. Time as 'Bad Eternity'

How does Plotinus fit into this history of the concept of time? At first sight his place is obvious. It is indeed from Plotinus (*via* Porphyry) that Augustine learned to understand time in relation to the soul rather than to physical motion. On the soul's *distentio* (extension) into past, present and future, Augustine merely repeats Plotinus. After having rejected all previous definitions of time, particularly the Aristotelian one, Plotinus gives this one as his own:

It is the extendedness (*diastasis*) of life that takes time, and the ceaseless forward movement of life takes ever new time, quite as life past took past time. Would it then not be sound to define time as the life-process of the soul in movement as it passes from one state of life into another?<sup>38</sup>

Plotinus rejects all time concepts derived from spatial representations, that is, time as identified with either a thing moved (Pythagoras), movement (Plato), or some quality of movement (Aristotle). To understand time in terms of itself, he turns inward—a displacement that presages not only Augustine, but Kant as well. Time, then, is the life of the soul. This definition also rejects Plato's theory of time as the product of the demiurge: "It is the soul that made time."<sup>39</sup> As the soul's life, time is 'prior' to the sensible world. Without time there would be no such world. For the classical tradition, on the contrary, there would be no time without the world. The soul, according to Plotinus, temporalizes<sup>40</sup> itself and thus the world. This is a new way of thinking that he states with some apology to his predecessors: "Possibly these [previous] thinkers did not yet theorize in this reversed fashion, and possibly we simply do not understand them."<sup>41</sup> The apparently obvious place of Plotinus in the history of the concept of time is the moment of its interiorization.

But what exactly is his 'reversed fashion' of thinking? Time "is something upon the soul, inherent in it, quite as eternity is to the [intellectual] realm above."<sup>42</sup> His new way of thinking can be stated in the proportionality:

time : soul :: eternity : mind.

It is the relation between time and eternity that separates Plotinus not only from the authors of early Antiquity but also from those in late Antiquity. His new way of thinking consists in understanding time out of eternity. In a strictly parallel way, because the soul can only be known

once the mind is known, he can define time as the life of the soul. This definition is thus not originary. It depends on the more fundamental premise enunciated in the proportionality above. His new way of thinking requires an examination of the *model* of time in the second hypostasis, the Mind. This model is eternity. However, it too is derivative. The new way of thinking, then, cannot stop short of the question, What is the model of eternity, in the One itself? It cannot stop short of the question of primordial time.

The Plotinian 'method' consists in always following a descending *hodos*, or path, of explanation. There can be no action of the sensible upon the intelligible within such an outlook. It is for this general methodological reason that inwardness cannot be Plotinus' last word about time. He does not conceive of time in relation to sense experience at all, be it located in the inner or the outer sense. It is true that his inquiry—as opposed to his explanation—proceeds from the exterior to the interior to the superior, but this itinerary does not properly constitute an ascent. He retains only the heuristic function of *anagogē*, at least as far as the issue of time is concerned.~ Thus he describes how a perceived outward movement of becoming, for instance in animal life, *reveals* the inward movement of psychic life, time; the life of the soul in turn *reveals* the life of the mind, eternity. In this regress of upward discovery it is clear that the One can be neither in time nor in eternity. It is the direct source of eternity and the indirect source of time. In keeping with the understanding, established earlier, of *to hen* as *to einai*—of the One as 'the to be'—the issue of primordial time can now be formulated in another proportionality:

the One : Mind : Soul :: 'to-be' : being : becoming :: X : eternity : time.

How are we to describe this unknown 'X'?

We may learn something about this unknown principle of eternity and time if we look at the way in which eternity mediates between the One and the life of the soul. Every mediating term must participate in the two terms that it connects, otherwise there would be no mediation. More specifically, the mediating hypostasis must have two *logoi*; it must be two-sided, turned both toward the hypostasis from which it proceeds and toward that which proceeds from it. Thus Proclus will later say: From the point of view of the One, the ideas are 'henads,' but from the point of view of the many, they are 'monads.' Furthermore, given the general framework of participation by deficient similitude, the lower degrees of *being*, the images, manifest the higher ones, the models. Plotinus must therefore

distinguish two aspects of eternity as both image of the One and model of time. "*Everlastingness* is the state pertaining to the substrate that stems from it and inheres in it; *eternity*, on the other hand, is the substrate [itself], together with the state which carries it into manifestation." As the image of the One, eternity is a *hypokeimenon* (substrate), even a god. But as the model of time, it is a *katasistasis* (state), of that substrate; it is a world. "Eternity is a god; he manifests himself, shows himself in his essence, namely the to-be without jolt or change, and therefore as also the firmly living."~ If everlastingness is "that state which carries [eternity] into manifestation," then eternity *appears* as everlastingness, as unvarying duration. Christian followers of Plotinus will conclude from this distinction between the essence of eternity and its appearance that everlastingness is only an inadequate analogy of the 'standing now' in which 'all is simultaneous.' In its appearance, eternity both manifests and obscures itself.

Something is lost, then, when we call eternity the model of time. Such an inductive proposition is incommensurate with the second hypostasis because the measure of eternity is the One. The commensurate way of thinking about eternity would have to be deductive. It would be more commensurate with the nature of time to call it the image of eternity. Any phenomenon is correctly understood only when it is placed in the light of the degree above it—which is the reason why there can be no knowledge of the One. Such is Plotinus' reversed way of thinking.~ Due to the merely heuristic function of anagogical reasoning, the treatise on eternity amounts to a negative treatise on the One. "Eternity is around the One."~ The ascending order of discovery—as opposed to the descending order of foundation—is spelled out clearly when Plotinus says:

It is now appropriate to state what *time* really is. To this end we must go back to the state we affirmed of *eternity*; unwavering life, undivided totality, limitless, knowing no divagation, at rest in the *One* and intent upon it."

From time to eternity to the One, what is the primordial condition of all derivative concepts of time that we reach?

## 6. Being as Time~

We saw that each of the traditional metaphysical attributes of the absolute—the Good, the Beautiful, Truth—originates in a specific human

experience. In Plotinus it is a general axiom that we can only philosophize about what we also 'touch,' that is, experience: "What understanding would succeed failing some point of contact? And what contact could there be with the utterly alien?"<sup>20</sup> We are indeed in contact with each of the hypostases: Through the experience of want, we are in contact with that of soul and time;<sup>21</sup> through the experience of intellectual intuition, with that of Mind and eternity;<sup>22</sup> through the experience of "going forth from the self (*ekstasis*), simplifying oneself (*haplōsis*), renouncing (*epidōsis*), reaching towards contact and resting (*stasis*)," with the One and primordial time.

This description of the way we are in touch with the One may sound like moral discourse. There is indeed a Plotinian imperative: *Become restful*. But such an injunction is possible only because we are already in touch with the One ontologically. The One does what man does when he is 'wise,' when he follows his nature and "lets all things be what they are."<sup>23</sup> Unification and simplification in Plotinus thus constitute essential traits both of man and of the One. Likewise, in Heidegger, *Gelassenheit*, 'releasement,' constitutes the essential trait not only of man when he becomes thoughtful, but more basically of *being* as an event. Even though Heidegger seems to wish to connect his 'letting' with the verb *parechein*, 'to offer, to make possible, to exhibit'<sup>24</sup> rather than with *eain*, this identity of man's way of living and *being's* way of presencing seems to me one indisputably common element between Plotinus and Heidegger. The One is no thing, no hypostasis, but sheer process—*eain*, *einai*, *henōsis*.<sup>25</sup> Likewise Heidegger's 'being' is no-thing,<sup>26</sup> but a process, 'letting-be.'<sup>27</sup> Man's life-process is formally identical with the being-process, be this called 'unification' or 'letting-be.'

Two key terms in Plotinus point to the One as event of appropriation, which is to say, as primordial time. These are *dynamis* and *archē*. The One is "the potential (*dynamis*) towards all things."<sup>28</sup> As such, it lets all things emerge from itself without suffering any diminution. Such letting-appear (a wholly unAristotelian notion of *dynamis*) occurs neither in time nor in eternity; it is the condition of both. At least as far as Heidegger's topological understanding of *Ereignis* is concerned, his reach towards what ultimately conditions all phenomena is not unlike Plotinus' reach. The One as ultimate potential is that event by which phenomena are left to their *topoi*, to the place that is theirs in the universal order of presencing and absencing. As the 'potential towards all things,' it *differs* from all. It is neither one of them nor their sum total. 'Potency' thus must not be misunderstood as the power of a supreme being. It is the condition that

enables all beings to appear; it is appearance as such. This phenomenological difference between appearance and the appearing in Plotinus is particularly evident when he warns us not to conceive of potency as a virtuality for things not yet existent: "It is not possible that anything else come into existence. There is nothing that did not come into existence when the all came about. [The One], however, never was the all."<sup>29</sup> As *dynamis*, the One is the movement by which the all becomes the 'uni-verse,' 'turned towards the One.' It is that sweeping *veriere*, turning, it is directedness as such.

As to *archē*, this term always refers to the One when used without qualification. It is frequently followed by a genitive: The One is "origin of process, origin of life, origin of the mind as well as of all things." As such it is something quite familiar to each of us: "We indicate it by virtue of what in ourselves is like it."<sup>30</sup> What is it in us that is like the *archē*? It is the fact that the body, the soul with its many layers, and the mind are integrated into one human being. It is humanity as a *principle of order* in us, as an ordering, that is like the One. The Greek *archē*, however, implies a motility that neither its Latin equivalents *imperium*, *regimen*, *princeps*, *principium*, *primum*—nor the English 'principle' preserve. In the text quoted earlier from Aristotle, this motility was likened to a battle that is forming. When an army takes flight, the disarray does not stop because one or two soldiers regain courage. But suddenly all may take up their formation. Then the activities of each turn into the action of all. So it is that the One is a forming of order, absolutely. It is nothing but the entrance of many factors into a constellation, nothing but the emergence of such a constellation. If on the contrary *archē* designated some *being* that dominates—although we may not know the nature of its dominion—then the Neoplatonic discourse about the One would indeed amount to negative theology. But the origin as *archē* is nothing other than *archein*, beginning, *oriri*. The subject-matter of negative theology is not divine world-government but something rather more tenuous: the event of arising from absence into presence. This event is impossible to hypostatize or to deify. Nor can it occur either in time or in eternity. It is not possible to construe such an arising as the emptiest genus of all types of unification, sensible and intelligible. It is, rather, the condition (*dynamis*) of these types, their coming-about (*archein*) as such. The One as *archē* is the condition that makes possible all and any forms of time.

It should be clear in what sense this concept of the One as unifying factor in all phenomena, as unification, 'overcomes' metaphysics. To overcome it is not to reject it. Quite the contrary. As we saw, the

metaphysical difference is integrated into henology as the step by which the mind transcends the visible. But the step by which, according to Plotinus, we can also transcend the intelligible is not metaphysical since it leads neither to the nature of substances nor to their ultimate ground. This second step of transcendence amounts to a 'working through' of the hypostatic Mind, a working through of metaphysics. The possibility of going beyond substance arises from the very *dynamis* of the One itself, not from some human faculty. Only when the One is understood as an event can it be claimed that negative henology is an overcoming of metaphysics.

Is it not a very minimalist reading of Plotinus to interpret the One as unification? Is it not utter functionalism to so radically de-substantialize the One that it is best designated by a verb rather than a noun? What, then, are we to make of those best known and most puzzling texts in which Plotinus speaks of an experience that is quite personal and datable? The *Ereignis* in no way refers to some lived experience, some *Erlebniss*. Porphyry, on the other hand, tells us that his master "achieved the supreme goal four times during the period I passed with him, by no mere latent fitness but by the ineffable act."<sup>14</sup> The *Ereignis* is nothing that happens to human beings, rather a *singulare tantum*. How, then, can the One as mere factor of economical ordering inspire lines like these?

Several times it has happened: awakening from the body to return to myself; leaving behind all things and becoming self-centered; beholding a marvelous beauty; then, more than ever, assured of community with the loftiest order; enacting the noblest life, acquiring identity with the divine; stationing within it by having attained that activity; poised above all other intellectual beings: yet, there comes the moment of descent...."

In light of the imperative mentioned earlier, we can answer: Here Plotinus speaks of those rare moments when it was given to him to 'let' all things be quite as the One lets them all be. His experience would constitute the opposite of the original classical Greek experience as reflected in Aristotle's *Physics*—the experience of making, fabricating, mastering nature. Plotinus stands outside the prevailing tradition in the West because to all forms (including theological) of domination he opposes *henōsis*, the experiential side of which is 'letting-be.' Practical *Gelassenheit* is however only a consequence of the *Gelassenheit* which is primordial time.

In Heidegger the ultimate condition of all forms of time is called, as we saw, the 'event of appropriation.' However, he adds that *being*, understood in this way, is not an unobstructed object for thought. "We

must never forget that expropriation (*Enteignis*) belongs essentially to appropriation (*Ereignis*)."<sup>15</sup> In Plotinian terms: We must never forget that the One as such is ineffable, that there can be no full manifestation of the One. It is part of its essence to hide itself from our thinking. Only as a consequence of this self-revealing, self-concealing nature of the One will any henology have to be essentially negative.

How, then, is the One primordial time? It is as the literally 'dynamic' identity of *being* and nothingness. After having described the transcendental step backwards from epochal temporality to primordial time, Heidegger adds: "The absence of [epochal] destiny from the event of appropriation thus does not mean that it lacks any 'motility'." The event is primordial time as "turning towards us in withdrawal."<sup>16</sup> In a comparable fashion, the One as *to einai*, 'the to-be,' renders itself absent as it renders itself present. While it remains wholly at rest, this interplay of presencing and absencing makes it the condition of all modalities of time.

What cognitive interest is operative when the absolute is called 'the One'? It may well be the attempt to understand *being* as time.

27. Concerning the meanings of this word I have nothing to add to Henri Birault's enumeration: "Firstly, *das Ereignis* commonly signifies 'the event' or 'the happening.' Secondly, *das Ereignis* derives from the word *eigen*, which means 'own,' 'proper,' or 'properly.' From this sense stem, for instance, *die Eigenschaft*, 'property' in the sense of 'attribute,' and *das Eigentum*, 'property' in the sense of 'possession,' but also the now quite obsolete philosophical notion *die Eigentlichkeit*, 'authenticity.' Fourthly, *das Ereignis* refers to the old German verb *er-äugen*, which is construed from *das Auge*, 'the eye' or 'the glance'": Heidegger et l'expérience de la pensée' (Paris, 1978), 41.
28. The first three types of causality are frequently ascribed by Plotinus to the One. As to matter, it is said to paradoxically resemble the One: it is formless (*Ennead* I.8.8, 21 and II.5.4, 12), not-being (*Ennead* II.5.4, 11), boundless (*Ennead* I.8.3, 13), and mere potentiality (*Ennead* II.5.5, 5).
29. *Physics* IV.11, 220a24.
30. Heidegger, *Wegmarken*, 353; translated by Sheehan, "On the Being..." 255.
31. "Ipsa mutabilitas...inqua sentiri et dinumerari possunt tempora, quia rerum mutationibus fiunt tempora," *Confessions*, Book XII, chapter 8, 8.
32. Cf. *The City of God* XI, 6, and *On the Trinity* IV.18, 24. Plotinus, in his treatise on time, called eternity *adiastatōs*, non-extended, *Ennead* III.7.3, 15.
33. *Confessions* XI.26, 33 and XI.20, 26.

34. Heidegger cites *Physics* IV.14—"if there were no soul time would be impossible"—and *Confessions* XI.26, 33 as examples of the 'ordinary' time concept. He adds: "The interpretation of Dasein as temporality does not lie outside the horizon of the ordinary concept of time," *Sein und Zeit* (Tübingen, 1957), 427; translated by J. Macquarrie and E. Robinson, *Being and Time* (New York, 1962), 479f.

36. Heidegger, *Seminare*, 73.
37. "The event always grants the time-span out of which history takes the while that guarantees an epoch," M. Heidegger, *Nietzsche*, volume II (Pfullingen, 1961), 490.
38. *Ennead* III.7.11, 42–46. I follow Hans Jonas, "Plotin über Ewigkeit und Zeit," in *Politische Ordnung und menschliche Existenz, Festgabe für Eric Voegelin* (Munich, 1962), 310f., in translating *zoē* as 'life-process' and *bios* as 'state of life.'
39. *Ennead* III.7.13, 47.
40. *Chronour* (*Ennead* III.7.11, 30). According to H. R. Schwyzer, "Plotinos" in *Realencyklopädie der klassischen Altertumswissenschaft* XXI, 1 (525 n14), this verb is probably a neologism forged by Plotinus himself.
41. *Ennead* III.7.13, 13.
42. *Ennead* III.7.11, 64.
43. In the early treatises, however, there are several paraphrases of the ascent according to Plato's *Symposium*, e.g. *Ennead* I.6.7 & 8.
44. *Ennead* III.7.5, 16–22. My reading of the distinction between everlastingness (*aidiotes*), and eternity (*aton*), as the two *logoi* of the mediating hypostasis differs from that of H. Jonas, "Plotin über Ewigkeit und Zeit," 297 n3, who admits of no difference in meaning between these two terms. The two-sidedness of eternity as a middle term, which I am trying to exhibit, provides the architectonic ground for the remark by Werner Beierwaltes—*Plotin: über Ewigkeit und Zeit* (Frankfurt, 1967), 156–158—for whom these terms are names of the same subject-matter, seen from two points of view. The later Latin authors make frequent use of the distinction between everlastingness and eternity, for instance as *sempiternitas mundi* and *aeternitas dei*. As to the substantivized verb *to einai* in this quote, it confirms my earlier distinction between negative henology and negative theology. Plotinus equates "the 'to-be'" with eternity, a god, the firmly living, that is, with the hypostatic mind. The same equation makes him speak of *to d'estin* (III.7.6, 18) and *esti monon* (III.7.3, 34), both of which refer to eternity.
45. "We begin with eternity, since when the stable exemplar is known, its representation in image which time is understood to be will be clearly apprehended. But it is of course true, admitting this relationship of time as image to eternity as the original, that if we chose to begin by identifying time we could thence proceed upwards by recollection (*anamnēsis*) and thus

- become aware of [eternity]" (III.7.1, 21–24). Plotinus does not carry out this inductive, upwards reasoning.
46. *Peri to hen* (III.7.6, 2f.). Eternity is *kentro-eidēs*, it looks to the center of which it is the periphery.
  47. *Ennead* III.7.10, 16–11 & 4.
  48. "Thinking the most difficult thought of philosophy, means thinking being as time," M. Heidegger, *Nietzsche*, volume I, 28; translated by D. F. Krell, "Nietzsche," *The Will to Power as Art*, volume I (New York, 1979), 20.
  49. *Ennead* III.7.7, 3f.
  50. What is in time 'lacks' (*elleipein*: III.7.4, 15) being, 'attracts' it (*helkon to einai*: III.7.4, 30), it must constantly 'acquire' (*epiktasthai*: III.7.4, 20) being, 'strive' (*ephesei tini ousias*: III.7.4, 31) after it as after what is to come (*ephesis to mellontos*: III.7.4, 34). From phrases like these it appears that "for Plotinus the future is what is properly temporal about time, the mode of its temporalizing," H. Jonas, "Plotin über...", 298. Possessing their end is therefore not the lot of things sensible; the Aristotelian concept of *entelecheia* here does not apply to the sublunary world.
  51. Eternity differs from time because there is no futurity, no not-yet in thinking: the act of *noesis* is identical with its object, the *noeton*. On the other hand, eternity also differs from the One, since noetic identity unites two terms: "The mind is number, but number and the like has its origin in the One. Further, the mind is together what thinks and what is thought, so that it is a duality" (*Ennead* III 8.9, 4f.).
  52. *Ennead* VI.9.11, 23f.
  53. *Eph' heauton eāsai einai*: *Ennead* V.5.12, 49.
  54. Heidegger, *Wegmarken*, 136; translated by J. Barlow and F. M. Comford, *Philosophy in the Twentieth Century*, ed. W. Barrett and H. D. Aikens, volume III (New York, 1962), 265.
  55. It is thus impossible to distinguish between the One and unification as between a substance and its act. H. Jonas seems to intend this impossibility when he writes: "relatedness to the ground is itself the ground" ("Plotin über...", 304).
  56. "What is entirely different from all beings is non-being; this 'nothing,' however, is the essence of being": Heidegger, *Wegmarken*, 101f.
  57. Being is *Anwesen-lassen* (with the emphasis on 'lassen'), 'letting-presence': Heidegger, *Vier Seminare*, 103.
  58. It is Meister Eckhart, mediating between Plotinus and Heidegger on this point, who is most explicit about the process-like identity between the essence of being and that of man; see the term *Ereignis* in the index of my *Meister Eckhart, Mystic and Philosopher* (Bloomington, 1978).
  59. *Ennead* III.8.10, 1. This usage of *dynamis* is irreducible to that of Aristotle. When predicated of the One, Plotinus' concept of potentiality or potency is neither kinetic (potency as "the origin of movement or change": *Metaphysics* IV.12, 1019a15) nor hyletic ("matter is what exists potentially": *Metaphysics*

- VIII.2, 1042b9). I take his usage in this context rather to be an excessive appropriation of Plato's, who writes: "As to potency, I solely consider to what it is related and what it effects." Plotinus' use here is excessive since for Plato there are many *dynamai*, "the strongest being knowledge" (*Republic* V, 477c-d). For Plotinus there can ultimately be only one *dynamis*, the One itself.
60. *Ennead* V.5.12, 48f.
  61. *Ennead* III.8.9, 39f. & 24.
  62. Heidegger says *verwinden*, which is reminiscent of the Freudian *durcharbeiten*—working through suffering or a neurosis. "This *Verwinden* is similar to what happens when, in the human realm, one gets over grief or pain": *Die Technik und die Kehre* (Pfullingen, 1962), 38; translated by W. Lovitt, *The Question Concerning Technology* (New York, 1977), 39.

  64. *Ennead* IV.8.1, 1–10.
  65. Heidegger, *Zur Sache des Denkens*, 46; translated by Stambaugh, *On Time and Being*, 43. Expropriation is related to appropriation as *lāhē* to *alāheia*: Cf. *Zur Sache...*, 44; *Time and Being*, 41.
  66. Heidegger, *Zur Sache...*, 44; *Time and Being*, 41.

enough, Bréhier suggests that matter is independent of the One but at the same time maintains some type of participation in the Good.<sup>4</sup>

Yet some authors believe that matter is independent of the One. Phillippus Pistorius contends that matter is pure negation, that all creativity is an activity of idea upon matter and that matter is eternal. He calls it "the imaginary point where God is not, and where there is, therefore, an absolute lack of reality...absolute evil."<sup>5</sup>

A number of authors are inclined to believe that for Plotinus the production of matter is in some way an activity of the One. E. R. Dodds, for example, strongly asserts that Plotinus will have none of the dualism which results in admitting an independent origin to matter or in making any kind of active source of evil. And, since matter is from the One, "incarnation as such is not necessarily an evil state."<sup>6</sup> Paul Henry contends that Plotinus has made the decisive jump from the One to matter by means of the emanative process.<sup>7</sup> A. H. Armstrong finds a paradoxical situation in Plotinus' account of matter since it is the principle of evil as well as "the last and lowest stage of procession from the Good."<sup>8</sup>

Among those authors who view matter as the endproduct of the emanative process, Dean Inge insists that matter must not be equated with absolute nothingness. He says that it is not "absolutely non-existent," and that below it, "there can be nothing, for the next stage below matter would be absolute non-entity."<sup>9</sup>

Jean Trouillard and Dennis O'Brien are perhaps the best spokesman for the monism of Plotinus. Trouillard says that "Plotinian matter is needed by the Good, and proceeds from it." It is "total indetermination," and still it is "integrated into the total process."<sup>10</sup> O'Brien says that there can be evil only "subsequent to the soul's production of matter."<sup>11</sup>

There remains yet another group of authors. They have no interest in the controversy over the origin of matter, but consider the problem to be meaningless. In general they say that because matter is such a weak and limiting concept this precludes its being an endproduct of the emanative process or an independent reality opposed to that process. John Murray says that matter is "nothing more positive than a determined limit" for the activity of the mind.<sup>12</sup> Joseph Katz calls matter 'complete powerlessness,' which does not exist, and is just "the furthestmost limit of power."<sup>13</sup> Of this latter group of authors, Cletus Carbonara is the most forceful. He maintains that Plotinus rejects dualism, but this rejection does not mean that matter is a part of the monistic overflow. Matter is not an independent reality in the Plotinian universe, not a creation of the One; it is pure negation.<sup>14</sup>

Clearly, Plotinian scholars do not agree on the origin and function of matter in the Plotinian universe. In fact, three possible positions have been noted: (i) matter is independent of the One and opposed actively or passively to it; (ii) matter is the end product of the procession from the One; and (iii) the question of the origin of matter is meaningless since matter is nothing at all.

The purpose of this study is to determine which, if any, of these positions best characterizes Plotinus' thought on the origin and role of matter—both corporeal and intelligible. Our method will be one of textual analysis; that is, several key texts, representative of Plotinus' early, middle and late literary periods, will be analyzed.<sup>15</sup>

### 1. Key Text A: *Ennead* II.4<sup>16</sup>

The title of this treatise is given by Porphyry in the *Life* as 'On the Two Kinds of Matter' (*Peri tōn duo hylōn*). It is number twelve in the chronological order and was written at a time when Plotinus did not seem to be particularly interested in the origin of corporeal matter. The treatise is important for our purposes, however, because Plotinus does indicate that intelligible matter is produced by the One.

The treatise begins with an acknowledgment that men generally agree that matter is a certain 'substrate' and 'receptacle' of form. This agreement dissolves, however, when they begin to question concerning the nature of matter and "how it is a receptacle and what of."<sup>17</sup> Chapters 2 through 5 are devoted to an analysis of intelligible matter while the remainder of the treatise is concerned with corporeal matter. It is important that we consider the function and origin of divine intelligible matter because matter Here is in some way an image of the matter There.<sup>18</sup>

Plotinus first presents the argument against there being matter in the intelligible world saying: "If what is of the matter kind must be indeterminate and formless, and there is nothing indeterminate or formless among the beings there, which are the best, there would not be matter there."<sup>19</sup> He counters this argument by pointing out that we must not despise the undefined or the idea of shapelessness since Soul itself is shapeless before being shaped by Intellect and Reason. The matter There is different from the matter Here in that the latter is always receiving different forms while the former always possesses the same form.

In the intelligible world matter is all things at once, so it has nothing to change into, for it has all things already. Accordingly, matter is never without form in the intelligible world since even the matter here is not, but each of them has form in a different way.<sup>22</sup>

Moreover, since the ideas are many, each must have something that is properly its own—its form (*morphē*) and that which is common to all, matter (*hylē*). Thus, if there is form in the intelligible world, there must also be matter which underlies and receives the form.<sup>23</sup> In fact, while the intelligible world is certainly indivisible, still it is, in a sense, divisible and matter exists in it. The intelligible world is unity amidst diversity, and the diversity is that of many forms. Take away the diversity of forms and what remains is formless and indeterminate (*amorphon kai aoriston*), viz. intelligible matter.

So, it must be formless before it is varied; for it you take away in your mind its variety and forms and forming principles and thoughts, what is prior to these is formless and undefined and it is none of these things that are on it and in it.<sup>24</sup>

And so that on or in which these intelligible realities have their unity amidst diversity is intelligible matter. Plotinus describes the origin of this matter as follows:

For Otherness There is eternal and produces intelligible matter for this is the principle of matter, this and the primary Movement. For this reason Movement, too, was called Otherness, because Movement and Otherness sprung forth together. The Movement and Otherness which came from the First are undefined, and need the First to define them; they are defined when they turn to It. But before the turning, matter, too, was undefined and the Other and no way good, but unilluminated from the First. For if light comes from the First, then that which receives the light before it receives it has everlastingly no light; but it has light as other than itself, since the light comes to it from another.<sup>25</sup>

Rist explains how this 'otherness' characterizes matter both Here and There. "All beings, that is, everything associated with any kind of matter, possesses 'otherness'; intelligible matter is 'other' than the One, that is than what is 'beyond Being,' matter 'here' is other than Being."<sup>26</sup> And that which is other There is intelligible matter which has its source in the One.

As 2, 4, 5, 30, makes abundantly clear, it is the very characteristic of the first product of the One, namely the substrate of the intelligible world of 'intelligible matter,' to be 'other' than its source.<sup>27</sup>

This 'otherness' of matter does not wish to remain such and continually strives to be filled from the same source that made it 'other.'<sup>28</sup> Now since everything after the One is other than It, all things have some characteristics of matter.<sup>29</sup> They are all produced in an initial overflow as indefinite, and through a conversion to their source they are informed and so complete hypostases.

Chapters 6 through 16 of II.4 are devoted to an analysis of corporeal matter as that which underlies changing beings. Change is not a coming to be from absolute non-being nor is destruction a total perishing into non-being. If this is true then that which changes and perishes must be a composite and as such it must be composed of matter and form. So beings that are destroyed "must be composed of matter and form: form is in relation to their quality and shape, and matter to their substrate, which is indeterminate because it is not form."<sup>30</sup>

Now matter which underlies form is without quality. "We must not attribute to it lightness or heaviness, density or rarity, and indeed not even shape and so not size either."<sup>31</sup> All the qualities that are seen in matter are brought to it by form. "So when the form comes to matter it brings everything with it; the form has everything, the size and all that goes with it and is caused by *logos*."<sup>32</sup> Therefore, since matter is without qualities, it is difficult to speak of it as anything other than a mere potentiality without potency. It is qualityless (*apoiós*) (I.8.10), non-being (*mē on*) (II.5.4 & 5), only a potentiality of being (II.5.5). But even devoid of qualities and other than being, matter still has its own particular characteristic which is simply its being 'other' than others. Rist calls this otherness of matter its nature.

This 'otherness' is its nature (*physis*), a nature which is not essentially quantified but continually admits a flux of changing qualities. Plotinus finds no difficulty in the idea of entities being unqualified (2, 4, 13). If this is so—and nobody disputes the existence and discussability of Quality—then the mere absence of qualities does not rule out the potential 'existence' of matter, or prevent its 'possession' of a nature.<sup>33</sup>

Rist's contention that matter in some sense has a nature appears to be correct. Plotinus himself asserts that just because matter is non-being does not mean that it is not.

Non-being here does not mean complete non-being but only something other than being; not non-being in the same way as the movement and rest which affect being, but like an image of being or something still more non-existent."

Apparently, Plotinus here employs Plato's work in the *Sophist* on negation. Plato had found it necessary to distinguish between the kinds of negation. His conclusion was that 'not being something' is not the same as non-existence." And so when something is said to be non-being, it is not necessarily non-existence but only something other than being. In this way, Plotinus can claim that matter has no being; it is non-being (*mē einai*), and that non-being has some kind of existence that is identical with privation. "Therefore, though it is non-being, it has a certain sort of 'being' in this way and is the same thing as privation."

Now one can not consign matter to the realm of non-being or privation and then forget about it. For although formless and indeterminate, it is the substratum of things.

There is need for some one kind of vessel or place to receive bodies; but place is posterior to matter and bodies, so that bodies would need matter before they need place...it is not an empty name but it is something underlying, even if it is invisible and sizeless."

Matter is analogous to a mirror but does not have the real existence that a mirror does over and above the appearances in it." The images of bodies that enter into it enter as 'falsity into falsity.' Matter is not visible like a mirror and must not be thought of as an object as the mirror is an object. The mirror is an analogy only insofar as it, too, is a 'receptacle' in which images come and go.

Finally, since matter has such a strange type of existence, it can be apprehended only by an equally strange kind of reasoning. Plotinus refers to the 'bastard reasoning' of the *Timaeus* saying that such reasoning does not originate in the mind, but in some illogical way." In order to 'see' matter, one must use "another intellect which is not intellect," an intellect that is devoid of all form and being. Intellect must leave its own light, as it were, and go outside, "to experience something contrary to itself." It must negate itself and become intellectless in order to see matter which exists outside of being."

And so in the twelfth treatise, Plotinus has presented a valuable analysis of the two kinds of matter. Our own analysis of the text has demonstrated that although intelligible matter has its origin in the overflow of the One, no such claim, on the basis of this treatise, can be made for

corporeal matter. The text does indicate, however, that the matter Here is an image of the matter There. It is without quality, a container of bodies, and identical with privation. In its very privation it can be said in some sense 'to be' but as to the source of this 'being' the text is silent.

## 2. Key Text B: *Ennead* III.4.1

This text, number fifteen in Porphyry's list, helps clear up some of the uncertainty concerning the origin of corporeal matter. In II.4 we saw that specific mention was made of the origin of intelligible matter, but no mention was made as to the origin of corporeal matter. Plotinus clears up this deficiency by saying that absolute indetermination (*aoristian pantelē*) is produced by Soul. The text is quoted at length because of its importance.

Some realities [the One and Intellect] remain unmoved when their off-spring come into being, but Soul has already been said to be in motion when it brings forth sense perception, which is a hypostasis, and the power of growth, which also extends to plants. Now Soul has the power of growth when it exists in us, but this power does not dominate because it is only a part of Soul; in plants, however, it dominates because it has, as it were, been isolated. But does this power of growth produce anything? It produces a thing altogether different from itself, for after it there is no more life and what is produced is lifeless. What is it then? Everything which was produced prior to this was produced formless but received form by turning towards its producer and being, as it were, reared to maturity, so here, too, that which is produced is not anymore a form of Soul—for it is without life—but absolute indetermination."

But what is this 'absolute indetermination'? Harder, in commenting on this text, asserts that absolute indetermination is matter." Plotinus himself lends credibility to this interpretation since he refers to matter as indetermination many times." Armstrong in commenting on the meaning of 'others' in II.4.13 adds further clarification.

To say something is 'other' than something else is a way of helping to define it, to show it as a distinctive unity; this remarkable plural is an attempt to exclude all definition, to speak of matter as absolutely indefinite and incoherent with no sort of distinctive unity."

In addition, the very metaphysical structure of bodies requires that matter be indeterminate. This is indicated by several texts but especially by III.4.1 itself.

When it [absolute indetermination] is perfected it becomes a body, receiving a form proper to its potentiality, a receptacle for the principle that produced and nourished it."

Now in another treatise Plotinus speaks of fire, air, water, and earth as the four kinds of bodies." It is the indetermination of matter that is raised to the level of bodies by the introduction of form. Without form coming to matter there would be no bodies. Why?

Because there would not be compounded bodies or even a simple body in reality, without the soul which is in the universe, since it is a rational principle coming into matter which makes a body, and that rational principle does not proceed from any other than Soul."

That which raises matter to the perfection of body is the very principle that produced it. It is first generated by Soul and then becomes the recipient (*hypodochēn*) of its generator. "It is not the body that is the recipient (*hypodochēn*), but the indeterminate matter." Once the power of growth generates and raises it to the level of body other forms can then be superimposed on the matter. For example, a living being is a result of the imposition of the forms of corporeality, element, and life on matter."

Body becomes the meeting place, as it were, between the higher realities and matter here below. "And only this form in bodies is the last trace of that above in the last depth of that below." That which is 'the last depth of that below' is matter.

Now it is necessary that what comes after the First should exist, and as a result that the last should exist, and this is matter, which has nothing at all of the Good."

Plotinus' universe has reached the point of no emanation, no overflow and no Being. Each stage of the emanatory process is characterized by the ability of the less perfect product to turn to its source and be filled, but matter, which is not perfect at all, is unable to turn towards its generator and so remains unformed and in darkness. Previous generations always possessed something of their generator in themselves, even though it may have been 'indetermination without form,' but matter possesses

nothing of the principle of growth which generated it and so is absolute indetermination.

The importance of this text is evident. Matter under the guise of absolute indetermination is explicitly linked with the chain of realities that ultimately has its source in the One.

### 3. Key Text C: *Ennead* III.6.14

The next text for consideration is from treatise number twenty-six, according to Porphyry's list. This treatise, along with the others written during Plotinus' middle literary period, may be more useful for an understanding of the Plotinian doctrine on the origin of matter than the more popular treatises such as I.8 and II.4. This is so because II.4, one of the earlier treatises, is representative of Plotinus' early thinking on matter, and I.8 is representative of his later thought "when his power was already failing." This treatise, then, written when his mental power was "at its height" should present to us, more than any other, his mature thought on the origin of matter. Moreover, if there is any development of his thinking on matter, this treatise should be a keystone in that development, coming between his earlier and later thinking.

The treatise entitled, 'On the Impassibility of Beings Without Body' seeks to demonstrate that both soul and matter are not subject to affections or modifications. With regards to matter Plotinus builds on a discussion just completed in II.5.5.

But if matter really was participant and received being as is commonly thought, what comes to it would be swallowed and sink into it. But, it is apparent that it is not swallowed but matter remains the same and receives nothing, but checks the approach as a repellent base and a receptacle for the things which come to the same point and there mingle: it is like the polished objects which one sets against the sun when he wants to get fire (and he fills some of them with water). Hence, the ray, being hindered by the resistance within, can not pass through but will be concentrated on the outside. So matter becomes in this way the cause of coming into being, and the things that are brought together in it are brought together in this way."

In II.5.5 Plotinus indicates that matter is 'cast out' and 'utterly separated' from all reality. The above citation adds credibility to this independence thesis; in fact, it would seem to suggest that matter is an independent reality which repels and halts the overflow process.

How does matter 'repel' this procession? It repels it "like the polished objects that one sets against the sun." This analogy is reinforced when Plotinus compares matter to a mirror and the beings that are in it to the images in a mirror.

The being which is imagined in it is not 'being' but only a fleeting frivolity; accordingly, the things which seem to come to be in it are frivolities, nothing but phantoms on a phantom, just like something in a mirror which really exists in one place but is reflected in another; the mirror seems to be filled but actually holds nothing while seeming to have all. 'Images of real beings pass into and out of it.' Phantoms into a formless phantom, visible because of its formlessness. They seem to act on it but produce nothing, for they are ghost-like and feeble and have nothing to resist them. They go through it without making ■ cut, as if through water, or as if someone in ■ way projected forms in the void."

This analogy aptly illustrates Plotinus' whole doctrine of matter and of bodies (and so the sensible world). If the images that we see in a mirror were really there, likewise the images present in matter would be there, but, of course, what is reflected in a mirror is not actually there." For a mirror appears to possess everything when actually it possesses nothing at all. Just as a mirror is not affected by the images in it, matter is not affected by the images on it." Moreover, matter is non-being and as such its reflections are non-being. The sensible world is a 'phantom on a phantom.'" Thus both matter and the sensible world have 'the being' of non-being: "The being of these is the being of things that do not exist."

Our text further states that matter is the cause of the generated beings, indicating that in some sense matter 'is' before these other things come to be. This is similar to the account given in III.4.1 where matter is first generated and then raised to the level of body. The coming to be of body is a result of the combination of form and unmodifiable matter. Once again the analogy of the mirror is useful. Just as a mirror must first exist before the images in it can come to be, matter must first exist before the things contained in it can come to be.

Well, then, if matter did not exist, would nothing come into existence? No, just as there would be no image, if a mirror or something of the sort did not exist. For that whose nature is to come into being in something else would not come into being if that something else was not, for that is the nature of an image, to be in another."

Since the sensible world is a 'phantom on a phantom' or an image on an image, matter must first exist before it can come to be. Matter must be before it can unite with form to produce body and so the sensible world.

In this text an interesting development has taken place in Plotinus' thought. Key Text B said that matter was first produced by the power of growth in Soul and it was only then that it was 'informed' by its producer. Through this information of matter by the power of growth in plants, bodies are produced. Our present text is much different in language as well as content. Matter is no longer produced and perfected by form, but is the cause of things as a repellent base. There appears to be no union of matter and form but only reflection. Matter is no longer referred to as being produced but that which halts production. Concerning matter's origin, if it has one, the text is conspicuously silent.

#### 4. Key Text D: *Ennead* V.8.7

In this, the thirty-first treatise according to Porphyry, Plotinus says that the visible universe comes into being as a whole; it is not planned and then made part by part by proceeds without thought or effort from Intellect—even corporeal matter.

Everything Here comes from There, and exists in greater beauty There; for here it is intermingled, but There it is pure. All this universe is occupied by form from beginning to end, matter first of all by the forms of the elements, and then other forms upon these, and then again others; hence, it is difficult to find the matter hidden under so many forms. Since matter too is a sort of ultimate form, this universe is all form, and all things that are in it are form."

In attempting to understand this text, the first half in which Plotinus says that everything is "occupied by forms from beginning to end" is relatively clear since everything that is Here is also There and "Intellect as a whole is all the forms."<sup>30</sup> Even the statement that matter is first of all occupied by the forms of the elements presents no difficulty since it is compatible with the earlier statement that matter is raised to the level of body through its union with form." A difficulty arises, however, when Plotinus calls matter 'a sort of ultimate form.' The Greek simply says *eidōs ti eschaton*, which literally means that "it [matter] is the last [or lowest] form."

This passage is both unique and difficult. Unique in that it is one of the only places in the *Enneads* that Plotinus implies that matter is a form;"

and difficult when we try to reconcile this account of matter with the very strong assertions that matter is formless." At first glance it appears that Plotinus is involved in a contradiction saying that matter is both formless and a form. This difficulty can be clarified, however, by calling to mind Proclus' notion of the extension of power, a notion also operative in Plotinus.

Proclus says in his *Elements of Theology* that a cause is more perfect and powerful than its consequents (Prop. 7), and so it will have a greater number of effects, for greater power produces more effects (Prop. 57).<sup>4</sup> Even those things produced by secondary causes are produced, in a greater measure, by prior and more determinate principles (Prop. 56). Thus the primal cause can be said to operate prior to its consequents, in conjunction with its consequents, and posterior to these same consequents.

From this it is apparent that what Soul causes is also caused by Intelligence, but not all that Intelligence causes is caused by Soul; Intelligence operates prior to Soul; and what Soul bestows on secondary existences Intelligence bestows in a greater measure; and the level where Soul is no longer operative Intelligence irradiates with its own gifts things on which Soul has not bestowed itself—for even the inanimate participates Intelligence, a creative activity of Intelligence, insofar as it participates form.<sup>5</sup>

Clearly, the Primal Cause of all, the One, has an extension which is beyond the secondary causative powers of Soul and Intelligence. Likewise, Intelligence has a greater causative power than Soul. This notion of the extension of power can be diagrammed as follows.

In the diagram we see that the One includes in its extension the secondary causes of intelligence and Soul, while Intelligence is inclusive of the causative power of Soul. As a causative power, the One goes beyond the productions of Intelligence and Soul and produces matter.

Thus, for Proclus, the causative power of the One extends to the whole universe. Everything in the universe, including unformed and

chaotic matter derives its reality (or non-being) from the One. The activity of Intelligence does not reach down as far as the One's precisely because it is not the primary principle or causative power. Intelligence does not generate matter. This is not to say, however, that Intelligence in no way effects matter. It shapes it like a potter shapes his clay, but as a potter does not cause clay to be clay, Intelligence does not cause matter to be matter.

Admittedly, there is not a one to one correspondence between Proclus' and Plotinus' respective positions. But through an analysis of Proclus' notion of the extension of power, much light is shed on Plotinus' position in V.8.7. It is our contention, in the remainder of our analysis of this text, that Plotinus includes matter as a 'sort of ultimate form' to demonstrate the scope of Intellect's causative power. He states at the outset of the text that "all that is here below comes from There" but this does not necessarily include matter. The whole universe, "from beginning to end," is occupied by form. Therefore, matter which is the Last<sup>6</sup> must also be occupied by form. It is first occupied "by the forms of the elements, and then other forms upon these, and then again others; hence, it is difficult to find the matter hidden under so many forms." The text concludes by saying that "matter too is a sort of ultimate form." This statement, which appears contradictory at first, now takes on a broader meaning as a result of our analysis of causal extension. Plotinus has said that everything is occupied by form, even matter since it is evident that matter is within the extension of Intellect's power. Since the content of Intellect is all the forms, Plotinus is able to conclude that because matter is affected by the power of the Intellect, it "too is a sort of ultimate form." But the fact that matter is an ultimate form does not necessarily imply a causal connection with Intellect. As we saw in our analysis of Proclus, matter is not dependent on Intelligence for its 'existence.' Rather, Intelligence effects and shapes matter, but it does not cause matter to be. Similarly in V.8.7, Plotinus demonstrates that the power of Intellect extends to matter, but a statement of causal connection is not present. For both Plotinus and Proclus, then, Intellect (Intelligence) shapes matter like a potter shapes his clay, but as the potter does not cause clay to be clay, the Intellect (Intelligence) does not cause matter to be matter. Its contact with form Here is, at best, a pale glimmer of union of matter and form There.

5. Key Text E: *Ennead* III.2.2

This treatise, number forty-seven in Porphyry's list, which Plotinus wrote towards the end of his life, is devoted to the traditional theme of providence. The text explains how belief in the existence and goodness of divine providence can be justified in the face of all the apparent evils in the world. The opponents he has in mind in writing this treatise are the Epicureans, who denied providence; the Peripatetics, who denied that it extended to the world below the moon; and most of all the Gnostics, who propounded the theory that the material world is the work of an evil creator.

The notable characteristic of this treatise is that in it alone Plotinus speaks of a rational forming principle, a *logos*, of the whole universe which appears to be a distinct hypostasis over and above the One, Intellect and Soul. However, Bréhier says, and here we concur with him, that the *logos* of this treatise is not that of a distinct hypostasis but is a way of speaking of the living, forming and directing matter which is derived from the Intellect. It keeps the material universe in the best possible order and brings it into a unity-in-diversity of contrasting and clashing forces which, far inferior to the unity of the intelligible world, is the best possible image of that world here below.<sup>7</sup>

But a unity-amidst-diversity is ■ universe that is not only one: there is a separation in it and therefore conflict. It is not the result of any kind of reasoning but flows necessarily from above.

This universe has come into existence, not as a result of the process of reasoning that it ought to exist but because it was necessary that there should be a second nature; for that true All was not of a kind to be the last of realities. For it was the first and had much power, indeed, all power, and this is the power to produce something else without seeking for it to be produced. For if it had sought, it would not have had it of itself, nor would it have been of its own substance, but it would have been like a craftsman who does not have the ability to produce from himself, but as something acquired, and gets it from learning. So Intellect, by giving something of itself to matter, made all things without itself being moved; this something of itself is the *logos* flowing from Intellect.<sup>8</sup>

This *logos* or rational forming principle, which Intellect gives to matter is not a distinct hypostasis but the presence of Intellect in everything that comes after it.<sup>9</sup> The world of Intellect is the archetype of the material

universe. Everything that is Here is also There, but There everything is alive and united in the rich fullness of eternal life.<sup>10</sup>

Just as the One must produce, the Intellect, the perfect image of the One, must also produce and this production is a movement towards matter.

Just like the One, Intellect produces pouring forth much power. Just as That, which was before it, poured forth its likeness, so what Intellect produces is a likeness of itself. This activity springing from being is Soul, which comes into being while Intellect remains unchanged: for Intellect too comes into being while That while is before It remains unchanged.<sup>11</sup>

Soul is matter in the sense that it is posterior and inferior to the Intellect in which it has its source. This concept of Soul as matter is wholly relational, as Dean Inge aptly demonstrates.

Matter is Matter only in relation to that which is next above it, and which gives it form, and indefinite existence. Thus the same thing may be form (*eidos*) in relation to what is below it. A thing is matter insofar as it is acted upon by a higher principle. It is a purely relative term; every stage in the hierarchy of being, except the highest, is *hylē* (matter), every stage except the lowest is *hylē*. Every *eidos* makes its own *hylē*. But *hylē* is generally the name for the lowest rung in the ladder.<sup>12</sup>

Thus in the hierarchical structure of the Plotinian universe each stage except the First and the Last is both *eidos* (form) and *hylē* (matter). The soul is both matter and form in that it is matter in regards to what comes after it. As form it is the extension of 'the *logos* flowing from Intellect.'

The Soul is, in effect, the *logos* of all things; as the *logos*, it is the last of the intelligible realities or of things included in the intelligible realm, and the first of things included in the sensible universe. It is therefore related to two worlds, happy and brought to life on the one hand; and on the other hand deceived by its resemblance to the First. And it descends here as if under the influence of a magical charm.<sup>13</sup>

Now Soul has two levels: the higher one which acts as a transcendent principle of form, order and intelligent direction; and a lower level, nature, which operates as an immanent principle of life. Nature, as an extension of the higher soul and ultimately Intellect, also produces according to the *logos* in it, but its formation is weak and poor since it is far removed from Intellect.

Intellect gives to the Soul of the All, and Soul (the one which comes next after Intellect) gives from itself to the soul next after it, illuminating it and impressing form on it, and this last soul immediately makes as if under orders. It makes something without hinderance, but in others, the inferior ones, it is impeded. In as much as its power to make is derived, and it is filled with *logoi* which are not the First ones, it will not simple make according to the forms but there would be an offspring of its own, and this is clearly inferior. Its product is a living being, but a very imperfect one, and one which finds its own life hateful since it is the worst of living things, ill conditioned and savage, made of inferior matter, a sort of sediment of the prior realities, bitter and embittering."

John N. Deck explains the relationship of soul, *logoi* and matter:

The soul, containing the *logoi* of all things in the visible universe gives *logoi* to the bodies of the visible universe (ch. IV.3.10.38-42). This giving of *logoi* is the producing of these bodies; that is, a body together with its size and extension, is brought about by a coming of *logoi* upon matter (ch. IV.7.2.22-25). This coming of *logos* is, from different aspects, a coming of unity, of form, of beauty, of life (Cf. I.6.2.13-24; IV.3.10.38-42). The trace of unity is the trace of form and beauty is the trace of intellectual beauty, and so again of the Nous."

This being the case, it is through the *logos* or rational formative principle that the power of the Intellect extends to the ends of the universe. The Soul, with its higher part in the realm of Intellect and its lower part reflecting these true realities on matter, is the vehicle by which the power of Intellect is disseminated. This dissemination of the power of the Intellect continues downward until it reaches the Last, matter, which is 'the lowest rung on the ladder.'

Key Text E has sought to demonstrate that Intellect has given something of itself in order to produce all things. This something of itself is the *logos*. Our analysis has shown that Intellect's 'movement towards matter' begins in its production of Soul. Through Dean Inge's conception of the relatively of matter, we are able to ascertain that all things, except the First and the Last, are both form and matter. We can further conclude that the One, as the First, can be said to be Form in relation to all things and matter to none since It is the First prior to which there is nothing. Likewise, the Last is matter to all things and form to none since it is the Last and there is nothing that comes after it. Concerning the origin of this matter, it appears that Plotinus has avoided the problem. The text says that "Intellect, by giving something of itself to matter, made all things," but we

are left in the dark with regards to the status of this matter before Intellect gave something of itself to it.

#### 6. Key Text F: *Ennead* I.8

The last text is from the eighth tractate of the first treatise, the famous treatise on evil. It is the fifty-first treatise, according to Porphyry, one of the last nine which were "written when his power was already failing." In fact, it was one of the last four treatises in which this waning of power is most evident."

Plotinus begins his study by asking what evil is and what is its nature. By so doing, he seeks to discover its source and whether it exists. But first an epistemological question concerning the nature of how we arrive at knowledge must be answered. Do we come to a knowledge of evil by something already in use? "But there would then be no way to discern by which powers in us we know evil, if knowledge of all is by likeness."<sup>20</sup> Or by knowledge of opposites?

But if opposites are known by the same kind of knowledge and evil is opposite to good, the knowledge of good is also the knowledge of evil, then those who wish to know of evils must have a clear perception of the good, since the better precedes the worse and the better is Form, and the worse is not, but rather privation of Form."

Plotinus chooses the latter approach and begins a discussion of the nature of the Good.

It is that on which everything depends and to which all beings aspire, they have it as their principle and need It: but It is without need, self-sufficient, lacking nothing, the measure and limit of all things, giving from itself Intellect and Being, Soul, Life and intellectual activity. Up to It all things are beautiful. But it is beautiful beyond all beauty and is king of the intelligible realm."

Nowhere in the life of the Good do we find any trace of evil or in the things that are necessarily related to It.

The Intellect is the first act of the Good and the first substance; the Good stays still in Itself, but Intellect moves about It in its activity, as also it lives around It. And Soul dances round Intellect outside, and looks to it, and in contemplating its interior sees God through it. "This is the life of the gods,"

without sorrow and blessed; evil is nowhere here, and if things had stopped here there would not have been any evil, only a first, a second and a third goods."

If we are to discover the nature of evil, we will not find it in the realm of being. But through a knowledge of the nature of the Good we have gained an insight into the nature of evil. The Good is characterized by measure, form and self-sufficiency, that to which all beings aspire. Evil, being opposite the Good, is characterized by its lack of measure and form and is such that no being should aspire to it." It cannot be a part of being since the whole of reality contains some order and measure.

One is able to conceive of evil as a kind of unmeasuredness in relation to measure, and unboundedness in relation to limit, and formlessness in relation to the cause of form, and perpetual neediness in relation to what is self-sufficient; always indeterminate, nowhere stable, completely passive, insatiate, complete poverty; and all this is not accidental to it but the essence of evil itself."

These characteristics deprive evil of any claim to being. It is beyond being not in the sense of the One which is supra-being but as infra-being. The very essence of this non-being is privation. If we say that something is not good because it lacks something, then this is evil accidentally. Evil so conceived is contained accidentally in something else and must itself be something before it can be contained in something else—it must be something else even if we cannot properly call it substance.

For if evil occurs accidentally in something else, it must be itself first, even if it is not a substance. Just as there is the Good Itself and good as an attribute, so there must be evil itself and the evil derived from it which inheres in something else...So, that which underlies figures and forms and shapes and measures and limits, decked out with an adornment which belongs to something else, having no good of its own, only a shadow in comparison to real being, is the substance of evil, if there really can be a substance of evil; this is what our reason discovers to be primal evil, evil itself."

So just as there must be an absolute good that is the source of all that is good, there must be an absolute evil that underlies all that is evil. Evil in a particular soul is the lack of a good (form) that ought to be there. Such a soul cannot be considered as primarily evil since it still shares in the good."

Now the medium which produces this falling short in the soul and is itself the farthest removed from the good is matter." Just as the good must exist, evil must exist and this is matter.

One can grasp the necessity of evil in this way. Since not only the Good exists, there must be the last end to the process of going out past It, or if one prefers to put it like this, descending or going away; and this last, after which nothing else can come into being is evil. Now it is necessary that what comes after the First exists, and therefore that the Last exists; and this is matter, which possesses nothing at all of the Good."

We have now reached a crucial stage in the analysis of this treatise. Does Plotinus mean, in the above citation, that matter is the last thing produced by the emanative process? Or is it the point at which this process is halted and turned back? The First interpretation would hold that matter is ultimately produced by the One, whereas the second would conceive matter as apart from and opposed to the productive power of the One.

At this point we must distinguish between the two matters in regard to this text and the notion of evil in general. In chapter two of this treatise, Plotinus has said that evil is nowhere to be found in the intelligible realm." Now intelligible matter belongs to this realm" and so it cannot be identified with evil. Clearly, the matter with which Plotinus is concerned in this text, and the treatise itself, is corporeal matter. This matter has nothing to call its own and is characterized by its privation. We cannot even call privation a quality of matter but a negation of quality. For Plotinus, such negations of quality are not themselves to be considered a quality. For example, noiselessness is not a quality of sound or anything else; rather, it is the absence of quality. To assert a quality of anything is to speak positively concerning it. Matter is without quality and as such it can be considered to be in a state of potentiality without potency. It is qualityless (*apoiós*)," non-being (*mē on*)," only a potentiality of being."

Yet, to say that matter is non-being is not to say that it does not exist. "Non-being here does not mean absolute non-being but only that which is other than being; not non-being in the same way as movement and rest which affect being, but like an image of being or something still more non-existent." Apparently, Plotinus here makes use of Plato's work in the *Sophist*. Plato had found it necessary to distinguish between the kinds of negation. His conclusion was that 'not being something' is not the same as non-being. Thus when it is said that matter is non-being, this does not mean that it is not, but only that it is other than being. In this way Plotinus

can claim that matter has no being\* and its non-being is identical with privation."

Thus matter is and is not. As there is ■ First, there must be a Last, and this is matter. As the Last, the Plotinian universe has reached the point of no production, no overflow and no Being. Concerning the problem of whether matter is the last stage produced by the overflow process or the extrinsic stone wall which halts this process, two additional texts are available which would appear to support the independence thesis.

The first text is taken from the first of two proofs for the necessity of evil—the second of which is given on the preceding pages.

The All must be composed of contrary principles; it would not exist at all if matter did not exist. 'For the generation of the cosmos was a mixed result of the combination of intellect and necessity.' What comes to it from God is good; the evil comes from the 'ancient nature.'<sup>10</sup>

In this text there is an apparent dualism. On the one hand, everything that comes into the All from God is good. On the other hand, everything that comes into the All from the 'ancient nature' is evil. What are we to understand by this 'ancient nature' (*tēs archaias physeōs*)? Once again we must remember that in this text, as in the previous one, Plotinus' emphasis is on the necessity (*anangkē*) of evil (matter), and not on evil's origin.

Matter must be because the universe is a combination of Intellect and necessity.<sup>11</sup> Apparently the 'ancient nature,' for Plotinus, refers to the unformed matter which is indeterminate and pure potentiality. The sensible universe is, as it were, the point at which matter and Intellect meet. That which is good in this universe is from 'God' (*via* Intellect) and that which is evil is from matter. Thus there are two sources of influence in the sensible universe, and the possibilities of a dualistic interpretation of this text are evident.

A second text which lends support to the dualistic thesis is one which traces the evil in the soul to matter:

This is the fall of the soul, to come in this way to matter and to become weak, because all its powers do not come into action; matter hinders them from coming by occupying the place soul holds which results in a kind of cramped condition, and making evil what it has got hold of by a sort of theft—until soul is able to regain its higher state. Accordingly, matter is the cause of the soul's weakness and vice and is itself evil before soul and is primarily evil. Even if soul had produced matter, being affected in some way, and had

become evil by communication with it, the presence of matter in it would have been the cause of its evil.<sup>12</sup>

Just as there is ■ primal good for the soul there is a primal evil, which, as the texts indicate, is matter. Matter has been called evil, non-being, the ancient nature, and now it is called the primary evil (*prōton kakon*). Nowhere in this treatise has Plotinus indicated that matter has its origin in the Good. In fact, he has consistently placed it opposite the First in the sense of a limit to the power of the One and as the Last. As the primary evil its evil is absolute and as such it has no share in the Good. If it had its origin in the Good through the emanatory process, however remote it is from the Good, this would be sufficient to warrant its having some share in the Good. The closest the text comes to indicating that matter might have its origin in the emanatory process is the statement: "Even if the soul had produced matter..." (*kai gar hei autē hē psychē tēn hylēn egennēse*).<sup>13</sup> But the use of *ei* with the aorist indicative *egennēse* indicates a very remote possibility, if not impossibility, that the soul is the producer of matter.

The result of this treatise is that Plotinus leaves us with a great amount of uncertainty as regards the status of corporeal matter. While it is true that he is not interested, in this treatise, with the problem of the origin of matter *per se*, nevertheless, in talking about the necessity of matter he uses a language full of dualistic implications.

## 7. Summary and Conclusions

Our analysis of several key Plotinian texts has discovered three distinct positions regarding the origin of matter. First, matter is not nothing but its position in the Plotinian universe is an unknown—even to Plotinus himself. Secondly, matter is independent of the One and therefore a principle opposed to It. Thirdly, matter is dependent on the One and as such is the end product of the overflow process. Our conclusion differs from the conclusions of other Plotinian scholars in that our study has shown that Plotinus held all three of these positions at specific times in his philosophical career. This conclusion can be verified by summarizing the key texts:

## II.4[12]

The analysis of this text has shown that intelligible matter has its origin in the One, but no such claim is made for corporeal matter. The text does indicate that the matter Here is an image of the matter There. It is devoid of quality, a container of bodies, identical with privation. In its very privation it can be said to exist but as to the source of this existence the text is silent.

## III.4[15].1

The importance of this text cannot be questioned. Corporeal matter, under the guise of absolute indetermination is explicitly linked to the chain of realities that ultimately have their source in the One.

## III.6[26].14

At this point in Plotinus' philosophical speculations, matter is no longer spoken of in terms of being produced, but it is that which halts all production. Concerning matter's own origin, if it has one, the text is silent.

## V.8[31].7

Plotinus demonstrates that the power of Intellect extends to matter, but a statement of causal connection is not present. Intellect shapes matter like the potter shapes his clay, and as the potter does not cause clay to be clay, the Intellect does not cause matter to be matter.

## III.2[47].2

The One which is the First can be said to be form in relation to all things and matter to none since It is the First prior to which there is nothing. Matter, being the Last, can only be matter to all things and form to none since it is the Last and as such there is nothing that is after it. Concerning the origin of this matter, Plotinus avoided discussing the problem. The text states that "Intellect by giving something of Itself to matter, made all things," but we are left in the dark with regards to the status of matter before Intellect gave something of Itself to it.

## I.8[51]

The result of this treatise is that Plotinus leaves us with a great amount of uncertainty as regards the status of corporeal matter. While it is true that he is not interested, in this treatise, with the problem of the origin of matter *per se*; nevertheless, in talking about the necessity of matter he uses a language full of dualistic implications. There is no indication whatsoever that matter is linked to the higher realities. It is the 'ancient nature' that is the cause of all evil in the world.

That the problem of the origin of matter plagued Plotinus throughout his philosophical career should now be evident. Of the three positions discovered in our analysis of the texts, the one which appears to predominate is the first: matter is not nothing; but Plotinus simply did not know where to place its origin in his philosophical system. This is most evident in his earliest treatises in which many characteristics of matter are discussed. Concerning its origin, the texts are painfully silent. There is a breakthrough, however, in II.4 in which Plotinus inextricably links the origin of intelligible matter to the overflow of the One, but no such claim is made for corporeal matter.

The situation changes with III.4.1 in which Plotinus' monism is most evident. Corporeal matter now has an origin and this origin is 'the power of growth in plants.' Matter is called 'absolute indetermination,' yet it is an indetermination that is tied to the chain of realities flowing from the One. But Plotinus' position of the origin of corporeal matter does not remain stable. After asserting that matter (absolute indetermination) has its source in the higher realities (III.4.1), he once again lapses into his state of uncertainty. Matter is no longer produced but is that which halts all production (III.6.14). This movement away from an emphasis on the origin of matter reaches its peak in I.8 in which Plotinus adopts the third position: matter is independent of the One and the point at which the power of the One is halted.

Plotinus' changing position on the origin of corporeal matter may be diagrammed as follows:

A	B	C	D
II.4[12]	III.4[15].1	III.6[26].14	I.8[51]
		V.8[31].7	
		III.2[47].2	

Tables B and D are indicative of Plotinus' monistic (matter appears to have its origin in the One) and dualistic (matter appears not to have its origin in

the One) positions respectively. Tables A and C are transition periods in Plotinus' philosophical development when he was at a loss as to where to place the origin of matter, if it had one, in his philosophical system. The uncertainty of A culminated in the monism of B while the uncertainty of C culminated in the dualism of D.

The question pursued in this study was whether Plotinus' monism is consistent in accounting for the origin of matter, or whether this monism devolves into a dualism because it makes no provision for this origin. At this point we can say that Plotinus' monism does devolve into a dualism but a dualism of implication rather than intent. At no time does Plotinus say that matter is not a product of the One, but his silence in this regard, especially in the later treatises, deals a deadly blow to his monistic inclinations. The problem of the origin of matter and its position in the universe can be termed the Plotinian albatross—a problem that was with Plotinus throughout his philosophical career and that weighed most heavily upon him in his later years. This is especially true in I.8 in which by the implication of his own language Plotinus appears to embrace a dualism which he heretofore would have avoided.

Ohio Dominican College

#### NOTES

1. Matter is always to be understood as the primary participant. For Plotinus and later for Proclus, this participant is identical with intelligible matter in the trans-sensible world and with corporeal matter in the sensible world.

  34. *Ennead* I.8.3, 7–10.
  35. For example, Plato says in 257b: "When we speak of 'that which is not,' it seems that we do not mean something contrary to what exists but only something that is different... So, when it is asserted that ■ negation signifies a contrary, we shall not agree, but admit no more than this—that the prefix 'not' indicates something different from the words that follow, or rather from the things designated by the words pronounced after the negative": translated by F. M. Cornford in *The Collected Dialogues of Plato*, ed. E. Hamilton and H. Cairns (New York: Pantheon Books, 1966), 1003–1004.
  36. *Ennead* I.8.5, 8ff.
  37. *Ennead* II.4.16, 3–5.
  38. *Ennead* II.4.12, 11–14 & 23–25. On matter as a receptacle see III.6.14, 28–37.
  39. For Plotinus' use of the analogy of the mirror in describing matter see III.6.13, 35–55.
  40. *Ennead* II.4.10, 6–13: "That which wants to be a thought about it [matter] will not be a thought but a kind of thoughtlessness; or rather the mental representation of it will be spurious and not genuine, compounded of an unreal part and with the diverse kind of reasoning. And it was perhaps because he had observed this that Plato said that matter was apprehended by a 'spurious reasoning'." This reference is to the *Timaeus* 52b2.
  41. *Ennead* I.8.9, 15–27.
  42. *Ennead* III.4.1, 1–2. III.9.3, 7–14 also speaks of the Soul's production of the indeterminate.
  43. Richard Harder, *Plotinus Shriften* Ib, 540.
  44. Texts in which matter is identified with indetermination are: II.4.4, 20; II.4.10, 34; I.4.11, 32 & 41; II.4.13, 6. As indefinite, "it is not quality but the substrate and the matter that we are looking for" (II.4.13, 6).
  45. *Ennead* II.4.13, 28–33 (page 140 n1). The text that he is commenting on is as follows: "Other things are not only other but each of them is something as form, but this would appropriately be called nothing but other; or perhaps others, so as not to define it as a unity by the term 'other' but to show its indefiniteness by calling it 'others'."
  46. *Ennead* III.4.1, 14–17.
  47. *Ennead* IV.7.2.

48. *Ennead* IV.7.2, 22–25. II.7.3, 8–14, gives a similar account of the coming to be of bodies.
49. Harder, Ib, 542–543. "Aber nicht der Körper ist sondern das Unbestimmte, die Materie...."
50. One is inclined to say a 'collection' of forms of matter but in VI.3.8, 26, Plotinus uses the word *migma* which means 'mixture.' Commenting on this text, Bréhier says: "But in Plotinus, as there is no such union of matter and forms, forms can be added to one another without the concrete ever becoming one. The sensible substance is, as it is in Locke, 'an aggregate of qualities and of matter'" (*The Philosophy of Plotinus*, 175).
51. *Ennead* III.4.1, 17–18.
52. *Ennead* I.8.7, 21–22.
53. Porphyry, "On the Life of Plotinus," 6, 26–36.
54. Porphyry, "Life," 6, 26–36.
55. *Ennead* III.6.14, 26–37.
56. *Ennead* III.6.7, 22–33. The analogy of matter as a mirror is used again in IV.3.11, 6–14.
57. *Ennead* III.6.13, 49–51.
58. *Ennead* III.6.11, 15–18 & 36–41.
59. *Ennead* III.6.7, 24.
60. *Ennead* III.6.6, 32–33. On the point of the sensible world as non-being, we must be careful not to misinterpret Plotinus. The sensible is beautiful (V.8.8, 7–23), but it is not the intelligible world—the world of true reality. It is an imitation: "Surely, what other fairer image of the intelligible world could there be?" (II.9.4, 22–23) This world is the best possible image of the world There. The plants There are the paradigms of the plants Here (VI.7.11, 6–17).
61. *Ennead* III.6.14, 1–5.
62. *Ennead* V.8.7, 18–29.
63. *Ennead* V.9.8, 4. For other examples of Intellect containing all the forms see VI.7.15; VI.7.22; V.9.6; V.8.3 & 4; VI.7.9; VI.7.12; V.1.4; VI.2.21.
64. *Ennead* III.4.1.
65. He says in I.8.3, 5, that matter is "a sort of form of non-existence...."
66. Examples of the formlessness of matter are: *Ennead* III.6.7, 28–30: "Imitation of real beings pass into and out of it [*Timaeus* 50c4–5]—ghosts into a formless ghost, visible because of its formlessness"; I.3.5, 23–24: "...ugliness is matter not mastered by form..."; II.4.8, 23–25: "So when the forms come to the matter it brings everything with it..."; I.8.8, 19–24: "For matter masters what is imaged in it and corrupts and destroys it by applying its own nature which is contrary to form, not bringing cold to hot but putting its own formlessness to the form of heat and its shapelessness to the shape and its excess and defect to that which is measured, till it has made the form belong to matter and no longer to itself...."

82. *Ennead* I.8.2, 2–10.
83. *Ennead* I.8.2, 21–29. The reference is to *Phaedrus* 248a1.
84. Perhaps a coined word such as ‘despire’ is more appropriate.
85. *Ennead* I.8.3, 12–17.
86. *Ennead* I.8.3, 22–25 & 35–40.
87. *Ennead* I.8.11, 15–20. I.8.12 continues the discussion begun in the previous chapter. “But what is the answer if someone says that the vice and evil in the soul is not absolute privation of good, but only a (particular, limited) privation of good? In this case, if it has some good and is deprived of some, it will be in a mixed state and the evil will not be undiluted, and we have not yet found primary, undiluted evil: and the soul will have good in its very substance, but evil as some kind of accident.”
88. Concerning the notion of matter as the cause of the soul’s failure to achieve its proper goal see: I.6.5; I.8.4 & 5; II.3.12, 9–11.
89. *Ennead* I.8.7, 17–23.
90. *Ennead* I.8.2, 26–28.
91. *Ennead* II.4.5. See Key Text A above.
92. *Ennead* I.8.10, 2.
93. *Ennead* II.5.4, 11–19.
94. *Ennead* II.5.5, 6–8.
95. *Ennead* I.8.3, 7–10.
96. *Ennead* I.8.5, 8–13.

97. *Ennead* II.4.16, 1–10.
98. *Ennead* I.8.7, 3–9. By ‘ancient nature’ Plato meant the underlying matter not yet set in order by some god. The citation is from *Timaeus* 47e5–48a.
99. Plotinus here echoes Plato who says in *Timaeus* 47e5: “For the creation of this world is the combined work of necessity and mind” (B. Jowett translation: *The Collected Dialogues of Plato*, ed. E. Hamilton and H. Cairns,) 1175.
100. *Ennead* I.8.14, 39–54.
101. *Ennead* I.8.14, 52–54. In I.6.5, 45–50, Plotinus says that the soul’s ugliness has come from the addition of alien matter and, if it is to be beautiful again, it must cleanse itself and be as it was before. For the means of purification, see I.8.9, 8–9 & I.9.

In this study my purpose is to attempt a critical analysis of Plotinus' proposed new set of categories for the Sensible world in connection with its Aristotelian background. From this analysis it will become clear why it was that Plotinus found Aristotle's categorial scheme defective and how he thought he could improve upon the Stagirite in this important area of philosophical inquiry. However, before I proceed to deal with the analysis and evaluation of Plotinus' arguments regarding the 'genera' of Becoming and their relationship to the 'genera of Being,' it will be well to draw attention to certain facts which indicate clearly, I think, the importance of the treatise under consideration. Such a clarification is necessary in view of the fact that modern scholars speak of this part of the *Enneads* as, to use Inge's expression, "one of the most obscure and least interesting."<sup>10</sup>

First of all, it is the case that in VI.3 Plotinus is concerned with the Sensible cosmos and its problems theoretically. This interest is rather unusual for the otherworldly philosopher and, therefore, significant. Presumably, Plotinus would not have bothered to write this treatise had he not been convinced that there was much confusion regarding the ontic problem of the 'genera of Being' and its relation to the problem of the categories of Becoming. Second, it is also the case that in VI.3, unlike VI.2, Plotinus challenges Aristotle in the field of his expertise, that is, the realm of the Sensible cosmos. The claim of Plotinus that Aristotle's set of categories, as it stands, is superfluous and cannot adequately account for the phenomena of this world, which it was supposed to explain, is a very serious charge. If Plotinus were right that the categorial scheme of Aristotle needs a drastic (fifty percent) reduction and certain other fundamental changes, which we will discuss in due course, in order to function well within the realm of nature, it would follow that Aristotle did not know what he was doing when he developed his theory of categories in the way he did. It is significant, I think, that subsequent generations of Neoplatonists, beginning with Porphyry, found it difficult to follow Plotinus' anti-Aristotelian tactics in so far as the doctrine of categories was concerned. Fourth, in this light, it would not be an exaggeration to suggest that the problematic of Aristotle's categories caused a schism in the Neoplatonic school in Rome in the middle of the Third Century A.D., and that Porphyry, in opposition to Plotinus, emerged as a champion of the movement towards a deeper reconciliation of Platonism and Aristotelianism by accepting and defending Aristotle's doctrine of categories in its entirety."

## I

The third tractate of the sixth *Ennead* opens in the following characteristic way:

We have now explained our conception of Reality (True Being) and considered how far it agrees with the teaching of Plato. We have still to investigate the opposed principle (the principle of Becoming)....

The subject of our discussion is the Sensible realm: Sensible Existence is entirely embraced by what we know as the Universe: our duty, then, would seem to be clear enough—to take this Universe and analyze its nature, classifying its constituent parts and arranging them by species. (VI.3.1, 1–11)

From this passage at least two things are evident: (1) The sharp contrast between the realm of 'True Being' and the realm of mere 'Becoming,' this Universe which Plotinus terms 'the opposed principle' (*heteraphysis*); and (2) the purpose (duty) which Plotinus poses to himself in the present tract is to determine under what genera the constituents of this Universe fall, and whether or not these 'genera' are similar to (or the same as) the genera of the other realm, i.e. the Intelligible cosmos (*kosmos noētos*).

Given, however, that this realm of Becoming is a 'mixture' (*migma*) of Body and Soul, Plotinus alerts us that the investigation should not take into consideration that element of the mixture which is 'alien,' viz. Soul. For, as he explains:

True, it involves the parallel existence of Body and Soul, for the Universe is a living form: essentially however Soul is of the Intellectual and does not enter into the structure of what is called Sensible Being.

Remembering this fact, we must—however great the difficulty—exclude Soul from the present investigation, just as in a census of citizens, taken in the interests of commerce and taxation, we should ignore the alien population. (VI.3.1, 23–28)

As to the question whether the genera posited for the Intelligible sphere will do well also with regard to the Sensible sphere, Plotinus' answer seems to be negative. Inasmuch as the two realms are different, Plotinus thinks that distinct and "new genera must be sought for this Universe" (VI.3.1, 20). The new 'genera,' consequently, can be called so only in an analogous way and homonymously.<sup>11</sup> In no way can they be regarded as 'primary genera.'

Substance (Real Being) requires no more than these five constituents; but when we have to turn to the lower sphere, we find other principles giving rise no longer to Substance (as such) but to quantitative Substance and qualitative: these other principles may be regarded as genera but not primary genera. (VI.2.15, 15–18)

And again:

Our first observations must be directed to what passes in the Sensible realm for Substance. It is, we shall agree, only by analogy that the nature manifested in bodies is designated as Substance, and by no means because such terms as Substance or Being tally with the notion bodies in flux; the proper term would be Becoming. (VI.1.3, 1–4)

Accordingly, ontologically important terms, such as Substance (*ousia*) and Being (*to on*) may be used in reference to the sensible world, but only homonymously, since the so-called 'beings' (*onta*) of this sensible realm are just reflections and images (*eidōla*) of the real Beings of the true and 'Authentic Being.' Thus, the relation between these two realms of existents is analogous to the relation of a living being and its portrait. While 'Up There' everything is both 'simple' and 'substantial,' " 'Down Here' everything is 'composite' and 'shadowy.'" At the end of the second tract (chapter 23) Plotinus used the following characteristic expressions in reference to this sensible realm: *indalma*, *eidōlon*, *eikōn*, *mimēma*, *phantasma*, *graphē*—all of which have the connotation of copy or ectype. Consider, for example, the following:

Up to the production of the image, the Intellectual realm is wholly and exclusively composed of Intellectual Beings: in the same way the Sensible world representing that in so far as it is able to retain the likeness of a living being, is itself a living being: the relation is like that of a portrait or reflection to the original which is regarded as prior to the water or the painting reproducing it. (VI.2.23, 36–40)

Again:

Observe also how in other things Motion or life is clearly separated from Being—a separation impossible, doubtless, in True Being, but possible in its shadow and namesake. In the portrait of a man much is left out, and above all the essential thing, life: the 'Being' of sensible things is just such a shadow of True Being, an abstraction from that Being complete which was life in the Archetype; it is because of this incompleteness that we are able in

the Sensible world to separate Being from life and life from Being. (VI. 2.7, 8–15)

In VI.3.3, Plotinus makes several tentative proposals about the 'genera' or categories of the Sensible realm and finally adopts a fivefold division which includes Sensible Substance or pseudo-substance, as MacKenna renders it" (*ousia legomene* or *aisthēē*), Quantity (*poson*), Quality (*poion*), Motion (*kinēsis*), and Relation (*pros ti*). A simple comparison of this list to that of Aristotle's categories reveals that, at least in name, four of them correspond to the cardinal Aristotelian categories of Substance, Quantity, Quality, and Relation. Plotinus' newly coined category or 'genus' of Motion is called in to substitute for two Aristotelian categories: action (*poiein*) and passion (*paschein*). Whether the Plotinian 'genera' and the Aristotelian categories share in everything else except for their common names will become apparent from the discussion of each of them separately.

The remaining twenty-five chapters of the present tractate are devoted to the discussion of the proposed five 'genera' of the Sensible realm. In accordance with the role which they play in the Plotinian theory, the proportional length devoted to each of these 'genera' is as follows:

- (a) Substance—seven chapters.
- (b) Motion—seven chapters.
- (c) Quantity—five chapters.
- (d) Quality—five chapters.
- (e) Relation—one chapter.

They are considered and discussed in the following order: Substance, Quantity, Quality, Motion, and Relation.

As expected, priority is given to the 'genus' or category of Substance (*ousia*) in respect to both length and order. After Substance comes the Plotinian category of Motion which is new and needs to be well considered and established. With regard to the categories of Quantity and Quality, nothing is unexpected. It is surprising, however, that the discussion of Relation has been compressed into one small chapter, in a way which contrasts sharply with the treatment given to the same category in the first tract. How is this discrepancy to be explained?

Without intending to offer a full explanation of this issue, it may be observed that Relation in a wider sense encompasses the other three Plotinian categories—viz. Quantity, Quality and Motion—as it is clear from the following:

Thus we have five genera, counting the first three entities as one. If the first three are not massed into a unity, the series will be Matter, Form, Composite, Relation, Quantity, Quality, Motion. The last three may, again, be included in Relation, which is capable of bearing this wider extension. (VI.3.3, 17–32)

Therefore, it may be argued that Plotinus found it unnecessary to discuss this category at length, since he had done so with regard to the other three. However that may be, it will be worthwhile to examine very briefly how Plotinus considers each of his categories or 'genera' of the Sensible world. In my discussion I will follow the same order as Plotinus, so I will begin with Substance.

Plotinus opens the discussion on Sensible Substance (*ousia aisthēē*) by raising the question: "What, then, we have to ask, is the constant element in the first three entities? What is it that identifies them with their inherent Substance?" (VI.3.4, 1–2). Seeking for the 'constant element' which will allow the three entities—Matter, Form and Composite—to be regarded as one 'genus,' Plotinus raises the further questions:

But what, we may ask, have Matter and Form in common? In what sense can Matter be conceived as a genus, and what will be its species? What is the differentia of Matter? In which genus, Matter or Form, are we to rank the composite of both? It may be this very composite which constitutes the Substance manifested in bodies, neither of the components by itself answering to the conception of Body: how, then, can we rank them in one and the same genus as the composite? How can the elements of a thing be brought within the same genus as the thing itself? Yet if we begin with bodies, our first-principles will be compounds.

Why not resort to analogy? (VI.3.2, 9–16)

Resort to analogy—which would mean to conceive Matter and Form as analogous to the genera of the 'True Being,' i.e. Substance and Motion respectively—is excluded for reasons given in the rest of chapter two of this tract. Instead, Plotinus goes on to consider five alternative 'constant elements,' some of which resemble Aristotle's 'peculiar character' (*idia*) of Substance, as will be seen presently.

According to the first alternative, the 'constant element' is identified as *hedra* or *hypobathra*—i.e. 'having the capability to serve as base.' This may be true with regard to Matter or with regard to Composite, Plotinus remarks. But apparently it can not apply to Form which, on this ground, would not be allowed to be considered as a Substance. So the first candidate must be rejected.

According to the second alternative, the 'constant element' is identified as "that which is not said of anything else" (VI.3.4, 7–8). This is evidently true in cases of Composite, e.g. Socrates. But what about Form and Matter? Are not they said to be the Form and Matter of something? To meet objections of this sort, Plotinus proceeds to distinguish, correctly I think, between that which is 'said of something else' because it is a part of that something considered as a whole, and that which is 'said of something else,' though they differ from each other. It is to the former where both Matter and Form belong. Whereas attributes, such as white, which are predicated of something distinct from itself, belong to the latter. In this connection, Plotinus states:

We conclude that nothing belonging to something else and predicated of it can be Substance. Substance is that which belongs essentially to itself, or, in so far as it is a part of the differentiated object, serves only to complete the Composite. Each or either part of the Composite belongs to itself, and is only affirmed of the Composite in a special sense: only *qua* part of the whole is it predicated of something else; *qua* individual it is never in its essential nature predicated of an external. (VI.3.4, 20–26)

According to the third alternative the 'constant element' is identified as *hypokeimenon*—i.e. 'having the capacity to be a subject.' Plotinus thinks that this property is common to all three entities—viz. Matter, Form and Composite—but not without some qualifications (*allōs*). For example, Plotinus contends that Matter is said to be *hypokeimenon* to Form in a sense which is not the same as when the Composite is said to be *hypokeimenon* to accidents, activities, consequents etc. (VI.3.4, 34–35).

According to the fourth alternative the 'constant element' is identified as 'not being present in a subject' (*mē ēn hypokeimenō*). Plotinus observes that this characteristic can not be applied to all entities called Substances, unless: "...presence in a subject be stipulated as not including the case of the part present in the whole or of one thing combining with another to form a distinct unity" (VI.3.5, 8–10). Thus, Form will not be present in Matter as 'in a subject,' nor will man be present in Socrates. For, as Plotinus explains, 'Man is part of Socrates' (VI.3.5, 13), not in the sense in which Socrates' hand is part of Socrates, but in the sense that Socrates is composite of Matter and Form."

It may be recalled here that Aristotle did not, in the end, admit this characteristic as the 'peculiar character' of Substance, on the ground that it did not characterize Substance solely.<sup>19</sup> For it is applicable to *differentia* as well. Plotinus seems to reject the view that *differentiae*, like

Substances, are not 'in a subject.' To support this thesis he argues along the following lines:

It may be objected that non-presence in a subject is not peculiar to Substance, inasmuch as the differentia of a substance is no more present in a subject than the substance itself; but this objection results from taking a part of the whole substance, such as 'two-footed' in our example, and asserting that this part is not present in a subject: If we take, not 'two-footed' which is merely an aspect of Substance, but 'two-footedness' by which we signify not Substance but Quality, we shall find that this 'two-footedness' is indeed present in a subject. (VI.2.5, 23-29)

According to the fifth and last alternative, the 'constant element' is identified as 'neither being present in a subject nor being predicated of a subject' (VI.3.5, 14-15). The expression 'neither...nor,' it may be recalled, states the peculiar characteristic of primary substance in the Aristotelian text.<sup>12</sup> As it is stated, however, this formula can apply only to the Composite. In order to make it fit all other entities, which Plotinus calls categories, he had to modify the formula a little by adding 'neither...nor predicated of *another as other*' (VI.3.5, 15). This little modification is very important because it allows Plotinus to draw the fundamental distinction between predicates predicated of a subject from which they differ essentially (e.g. 'a piece of wood is white') and predicates predicated of a subject from which they do not differ essentially (e.g. 'Socrates is a man'). For, according to Plotinus:

When I predicate Man of Socrates, it is as though I affirmed, not that a piece of wood is white, but that whiteness is white; for in asserting that Socrates is a man, I predicate Man (the universal) of a particular man, I affirm Man of the manhood in Socrates; I am really saying only that Socrates is Socrates, or that this particular rational animal is an animal. (VI.2.5, 17-23)

In other words, cases of *essential predication* seem to be reducible to cases of *self-predication*, i.e. tautologies. For example, to predicate 'man' of an individual is the same, according to Plotinus, as to say that 'Socrates is Socrates.' The problem of predication, however, is very complex and cannot be considered here.<sup>13</sup> Suffice it to emphasize here that the formula 'neither...nor...' as modified by Plotinus can encompass both Aristotle's secondary substances and Plato's eternal Forms. Even so, Matter is left outside. Realizing this, Plotinus gives up the effort to find a formula which

will provide the needed 'constant element' and concludes in the following way:

The truth is, however, that the 'Substance' of our enquiry may be apprehended in directly opposite ways: it may be determined by one of the properties we have been discussing, by more than one, by all at once, according as they answer to the notions of Matter, Form and the Couplement (VI.2.5, 35-39)

Although he has said much about this issue, Plotinus is aware that he has not clarified the category of Sensible Substance, nor has he provided a 'definition' of it as yet. Thus, he is ready to attempt another approach in order to discover what is that peculiar characteristic which distinguishes Substance from the other 'genera' of Becoming. Eventually he will find a solution to this problem in what I shall call the doctrine of *double dependence*. I shall explain what this expression is supposed to mean, after I have quoted Plotinus once again on the equivocation of the term 'existence' (*einai*), as applied to different categories of the sensible realm. Plotinus argues:

What, then, is the meaning of 'existence' as applied to fire, earth and the other elements? What is the difference between this existence and existence in the other categories? It is the difference between being simply—that which merely is—and being white. But surely the being qualified by 'white' is the same as that having no qualification? It is not the same: the latter is Being in the primary sense, the former is Being only by participation and in a secondary degree. Whiteness added to Being produces a being white; Being added to whiteness produces a white being: thus, whiteness becomes an accident of Being, and Being an accident of whiteness. (VI.2.6, 8-18)

Also:

The Being of the Sensible resembles the white in not originating in itself. It must therefore be regarded as dependent for its being upon the Authentic Being, as white is dependent upon the Authentic Whiteness, and the Authentic Whiteness dependent for its whiteness upon participation in that Supreme Being whose existence is underived. (VI.2.6, 28-32)

Now it is somewhat easier to explain what distinguishes sensible substance from the other 'genera' of the sensible realm. The distinction is based on the formula of double dependence. For, as it is evident from the two passages quoted above, especially the second one, while the sensible

Substance is dependent upon the 'Authentic Being' for its existence, the sensible white depends upon the 'Authentic Whiteness' which in turn is dependent upon the 'Authentic Being' ultimately. That is to say, in the category of sensible substance we have *simple dependence*, whereas in the other sensible categories or 'genera' the dependence is *double*.<sup>28</sup> It is in this respect that Sensible Substance is differentiated from the other 'genera' of Becoming.

Let us turn our attention now to another point of importance which Plotinus discusses in this connection—viz. the problem of priority between the two constituents of the Composite: Matter and Form. This is not an easy problem to solve because its solution, that is, priority of the one constituent over the other seems to depend on the viewpoint from which one considers the whole matter.

That Matter is not a Primary we have established elsewhere. If it be urged that other things can have no subsistence without being implanted in Matter, we admit the claim for Sensible things. But though Matter be prior to these, it is not thereby precluded from being posterior to many things—posterior, in fact, to all the beings of the Intellectual sphere. Its existence is but a pale reflection, and less complete than that of the things implanted in it....

But once concede that Form is higher in the scale of Being than Matter, and Matter can no longer be regarded as a common ground of both, nor substance as a genus embracing Matter, Form and the Couplement. True, these will have many common properties, to which we have already referred, but their being (or existence) will nonetheless be different. (VI.2.7, 3–16)

Evidently, by 'things implanted in Matter' Plotinus means the Forms which are "higher in the scale of being than Matter," we are told (VI.2.7, 12–13). Now, granted that "when a higher being comes into contact with a lower, the lower, though first in the natural order, is yet posterior in the scale of Reality," (VI.2.7, 16–18) the conclusion seems to follow, as Plotinus puts it:

If Being does not belong in equal degrees to Matter, to Form and to the Couplement, Substance can no longer be common to all three in the sense of being their genus: to their posteriors it will bear a still different relation, serving them as a common base by being bound up with all alike. Substance, thus, resembles life, dim here, clearer there, or portraits of which one is an outline, another more minutely worked. By measuring Being by its dim manifestation and neglecting a fuller revelation elsewhere, we may come to regard this dim existence as a common ground....

We conclude that the term 'Being' must have different connotations as applied to Matter, to Form and to both conjointly, in spite of the single source pouring into the different streams. (VI.2.7, 12–30)

It is clear, therefore, that Plotinus realizes finally that the term 'to be' (*einai, to on*) is a *pollachōs legomenon*, as Aristotle had pointed out; it is a term with 'focal meaning' to use contemporary terminology.<sup>29</sup> Be it as it may, the conclusion reached by Plotinus—viz. that the 'being' does not mean the same thing when applied to Matter, Form, Composite, entities of the Sensible or the Intelligible Realms—led him to declare that:

The division into elements must, in short, be abandoned, especially in regard to Sensible Substance, known necessarily by sense rather than by reason. We must no longer look for help in constituent parts, since such parts will not be substances, or at any rate not sensible substances.

Our plan must be to apprehend what is constant in stone, earth, water and the entities which they compose—the vegetal and animal forms, considered purely as sensibles—and to confine this constant within a single genus. (VI.3.8, 1–6)

Thus, it would seem that we are back again at the point from which we started, viz. the composite entities of the Sensible World. But now the emphasis will be put, not on the constituents, but on the composite things as such (*syntheta*), which are considered as (a) "actually many substances in one" (VI.3.8, 9), though (b) "not everything which composes the amalgam is Substance, but only the amalgam as a whole" (VI.3.8, 29–30). It may be objected here that (a) and (b) as stated above seem to be incompatible with each other. Whereas the first asserts that 'composites' are actually a collection of many substances,<sup>30</sup> the second seems to deny it by considering as Substance only the amalgam 'as a whole.' For Plotinus, the two statements are not necessarily contradictory or incompatible; they are the outcome of two different considerations. For (a) considers 'composites' sensible being—as composed of such elements as fire, earth, air and water, which in themselves are composites of Matter and Form (VI.3.8, 7–12). But (b) considers a 'composite' sensible being as Composite of Matter, Form, Qualities, Activities and all other Accidents (*symbebēkota*) which go with 'composite,' and which separately can not be called Substance in the same sense (VI.3.8, 13–27).

Apart from the above objection, what really bothers Plotinus is that, if (b) is taken literally, it would seem that sensible substances are derived from non-substances, which is somehow disturbing. For how can

Substance come out of something which is not substantial? Such a claim would seem to amount to its being created *ex nihilo*, and this certainly is neither rational nor acceptable to a Platonist, like Plotinus. Much of the confusion, however, may be cleared up if we recall that the discussion here is about Sensible Substance, which is but a mere 'reflection' and 'shadow' of the Authentic Substances of the Intelligible realm. Plotinus explains:

And let no one take exception on the ground that we produce Sensible Substance from non-substances. The whole amalgam itself is not True Substance; it is merely an imitation of that True Substance which has Being apart from its concomitants, these indeed being derived from it as the possessor of True Being. In the lower realm the case is different: the underlying ground is sterile, and from its inability to produce fails to attain to the status of Being; it remains a shadow, and on this shadow is traced a sketch...the world of Appearance. (VI.3.8, 30-37)

That is the way in which Plotinus considers the Sensible World whose 'genera' he tries to determine. This Universe is simply a picture or sketch (*zōgraphia*) drawn on a shadow, that is, the barren Matter (*agonon*). Such a conception is evidently very different than Aristotle's conception of this World. Plotinus thinks that he has said enough about the 'so-called' substance (*legomenē ousia*), or 'pseudo-substance,' as MacKenna renders it. Next he proceeds to examine the kinds (*eidē*) of Sensible Substance, which will provide him with the opportunity to criticize Aristotle's distinction between primary and secondary substances. I shall consider this issue briefly here.

To begin with, Plotinus postulates body (*sōma*) as the highest 'genus' with reference to the Sensible world. Then, by applying the Platonic method of division he is able to obtain a scheme of subordinate species and genera in a way which closely resembles the 'Porphyrian Tree.'<sup>2</sup> This division of sensible substances is given in the following passage:

But what are we to posit as its species? How divide this genus?

The genus as a whole must be identified with body. Bodies may be divided into the characteristically material and the organic: the material bodies comprise fire, earth, water, air; the organic the bodies of plants and animals, these in turn admitting of formal differentiation. (VI.3.9, 3-6)

This is not the only possible division, according to Plotinus. On the contrary, he mentions two more: (a) The division which is based on such qualities as hot, dry, cold, moist; and (b) the division which is based on

forms or shapes (*morphai*). Both (a) and (b) are related to sense-perception. He observes: "Since our discussion is concerned with Sensible Substance, it is not strange that it should turn upon distinctions related to sense-perception: This Substance is not Being pure and simply, but the Sensible Being which we call the Universe" (VI.3.10, 12-15). Once again, Plotinus felt it necessary to stress the differences which separate the two realms, that of Becoming and that of Being.

With regard to the Aristotelian distinction between primary and secondary substances, Plotinus seems to agree that there are not different kinds of Substances, because they do not differ essentially from each other. Yet, he rejects Aristotle's view expressed in the *Categories* according to which the particular (i.e. primary Substance) is prior to the universal (i.e. secondary Substance).<sup>3</sup> Plotinus thinks otherwise on this issue as it is evident from what follows:

We may be told that Man (the universal) is Form alone, Socrates Form in Matter. But on this very ground Socrates will be less fully Man than the universal;...

Besides, the more general is by nature prior; hence, the Form-Idea is prior to the individual: but what is prior by nature is prior unconditionally. How then can the Form take a lower rank? The individual, it is true, is prior in the sense of being more readily accessible to our cognisance; this fact, however, entails no objective difference.

Moreover, such a difference, if established, would be incompatible with a single Reason-Principle of Substance; First and Second Substances could not have the same Principle, nor be brought under a single genus. (VI.3.9, 32-42)

It may be noted here that the distinction between 'prior by nature' (*physei proteron*) and 'prior with regard to us' (*pros hēmas proteron*) is parallel to Porphyry's distinction between 'prior by nature' and 'sensibly prior' (*aisthēsei proteron*).<sup>4</sup> The Plotinian insight here, like the Porphyrian, is that for *x* to be prior to *y* in one sense does not imply necessarily that it will be prior to that in every sense. This formula, indeed, played an important role in Porphyry's efforts to reconcile the Aristotelian doctrine of the concrete individual (*tode ti*) with the Platonic theory of Forms (universals), as well as the Platonic-Aristotelian theories of the Sensible World with the Platonic-Plotinian theories of the Intelligible realm.

In conclusion it can be said that Sensible Substance is accepted by Plotinus as a 'genus' of the sensible world. But no one should be misled

as to the fact that the 'being,' to which this 'genus' refers is only an image of the 'Authentic Being.' Thus, the use of the term 'Substance' (*ousia*) in its double reference covers ■ case of homonymy."

## II

As in the *Categories*, Quantity occupies the second place in Plotinus' list of the 'genera' of the Sensible world. In his discussion of this 'genus,' Plotinus wants to make clear from the very beginning that (a) only quantities related to matter—but not Absolute Quantity—will be considered here, and (b) only number (*arithmos*) and magnitude (*megethos*) are to be regarded as true quantities. He states:

Passing to Quantity and the quantum, we have to consider the view which identifies them with number and magnitude on the ground that everything quantitative is numbered among Sensible things or rated by the extension of its substrate: we are here, of course, discussing not Quantity in isolation, but that which causes a piece of wood to be three yards long and gives the five in 'five horses.' (VI.3.11, 1–5)

Accordingly, three of the seven Aristotelian 'kinds' (*eidē*) of quantities are left out. These quantities are identified as Place or Space (*topos*) and Time (*chronos*)—which Aristotle classified with the continuous quantities—and *logos* (speech, discourse)—which Aristotle considered as discrete quantity. According to Plotinus, these quantities (*posa*) are reducible to the other 'genera' which were mentioned above. Of these the first two can be assigned to Relation, while the third must be referred to Motion. The justification of this reduction is stated by Plotinus in the following way:

Now we have often maintained that number and magnitude are to be regarded as the only true qualities, and that Space and Time have no right to be conceived as quantitative: Time as the measure of Motion should be assigned to Relation, while Space, being that which circumscribes Body, is also a relative and falls under the same category; though continuous, it is, like Motion, not included in Quantity. (VI.3.11, 6–11)

Also:

Syllable and discourse are only indirectly quantities or substrates of Quantity; it is voice that is quantitative: but voice is a kind of Motion; it must accordingly in any case (quantity or no quantity) be referred to Motion, as must activity also. (VI.3.12, 25–28)

In agreement with Aristotle, Plotinus rejects as non-quantities those comparatives which Porphyry, commenting on this category, called 'comparative quantities' (*aorista posa*)—e.g. 'more,' 'less,' 'more beautiful' etc.—on the ground that they belong to relatives. For the same reason 'large' and 'small'—as in the expressions 'a large tree,' 'a small mountain' etc.—are reducible to comparatives, and ultimately to relatives. For Plotinus, as for Aristotle, these expressions are equivalent to 'a tree larger (i.e. taller) than another tree' and 'a mountain smaller than (i.e. not as high as) another mountain' respectively. Apart from that, Plotinus, unlike Aristotle, wants to assert that "it is some kind of Quantity which gives greatness to the great." He queries:

On the other hand, why do we not find in the category of Quantity 'great' and 'small'? It is some kind of Quantity which gives greatness to the great; greatness is not a relative, though greater and smaller are relatives, since these, like doubleness, imply an external correlative. (VI.3.11, 12–14)

Similarly with 'the beautiful' (*to kalon*):

In sum, just as there is a Reason-Principle of Beauty, so there must be a Reason-Principle of greatness, participation in which makes a thing great, as the Principle of beauty makes it beautiful. (VI.3.12, 17–19)"

Considerations such as the above led Plotinus to accept that there is *contrariety* in the category of Quantity—which Aristotle had denied." The possibility of receiving contraries was, for Aristotle, an indication that the 'quantities' involved were in fact not quantities, but relatives. Plotinus takes the opposite view:

...we must allow contrariety to Quantity: whenever we speak of great and small our notions acknowledge this contrariety by evolving opposite images, as also when we refer to many and few; indeed, 'few' and 'many' call for similar treatment to 'small' and 'great.' (VI.3.12, 1–5)"

And again:

To judge from these instances, there is contrariety in Quantity. Place we may neglect as not strictly coming under the category of Quantity; if it were admitted, 'above' could only be a contrary if there were something in the universe which was 'below': as referring to the partial, the terms 'above' and 'below' are used in a purely relative sense, and must go with 'right' and 'left' into the category of Relation. (VI.3.12, 19–25)\*

Finally, Plotinus accepts the Aristotelian distinction between *continuous* and *discrete* quantities and also the basis for this distinction as given by Aristotle:

It has been remarked that the continuous is effectually distinguished from the discrete by their possessing the one a common, the other a separate limit. (VI.3.13, 1–2)

Number, according to Plotinus, belongs to the latter and can be subdivided into odd and even numbers. On the other hand, magnitude belongs to the former and is subdivided into lines, surfaces, and solids. But to speak of division here is rather misleading. This procedure should be called enumeration (*katalithmēsis*) for the reason that the distinction prior/posterior is involved in the different magnitudes, whereas simultaneity characterizes the species of the divided genus. In this connection Plotinus states:

But how are we to differentiate the continuous, comprising as it does line, surface and solid? The line may be rated as of one dimension, the surface as of two dimensions, the solid as of three, if we are only making a calculation and do not suppose that we are dividing the continuous into its species; for it is an invariable rule that numbers, thus grouped as prior and posterior, cannot be brought into a common genus; there is no common basis in first, second and third dimensions. Yet there is a sense in which they would appear to be equal—namely, as pure measures of Quantity: of higher and lower dimensions, they are not however more or less quantitative.

Numbers have similarly a common property in their being numbers all; and the truth may well be, not that One creates two, and two creates three, but that all have a common source. (VI.3.13, 9–20)

Now, if line is a quantity, and if a triangle is the product of three lines, then to the question "Why is not the product of three lines included in Quantity?" Plotinus' answer is that "a triangle consists not merely of three lines but of three lines in a particular disposition, a quadrilateral of four lines in a particular disposition: even the straight line involves disposition

as well as quantity" (VI.3.14, 8–11). He seems to share Aristotle's view that one and the same entity can be classed under two different categories provided that each time it will be considered from a different point of view:

If however by classing the triangle and the rectangle as *qualia* we propose to bring figures under Quality, we are not thereby precluded from assigning the same object to more categories than one: in so far as it is a magnitude—a magnitude of such and such a size—it will belong to Quantity; in so far as it presents a particular shape, to Quality. (VI.3.14, 18–22)

Consequently, it is not absurd that Geometry, which deals with figures—"viz. triangles, quadrilaterals, etc.—"is the study of magnitudes" (VI.3.14, 16). Thus, Plotinus is able to claim that "if we are told that equality and inequality are characteristic of Quantity, that is not to deny that similarity also may be predicated of certain quantities" (VI.3.15, 4–7). This is evidently an allusion to Aristotle's *Categories*, where equality and inequality are presented as the 'peculiar character' of Quantity.<sup>27</sup> This brings the discussion on the 'genus' of Quantity to an end. But there is a last point which needs to be considered before I proceed to examine the next 'genus' of the sensible world.

The point which Plotinus makes at the end of chapter 15 is that, in contrast to Aristotle's strong position that the individual or primary substance signifies a concrete individual, the sensible substance (*legomenē ousia*) is rather a 'qualified something' (*poion ti*). Hence, that which signifies substance and essence (*to ti einai*) is not the individual but the universal as expressed by *logos*. Compared with what Aristotle states about the expression 'this-such' (*tode ti*) in the *Categories*<sup>28</sup> and about the expression 'what something is' (*ti en einai*) in the *Metaphysics*,<sup>29</sup> the following quotation may show that Plotinus confused the two expressions and their different meanings:

We have spoken of Quality as combining with other entities, Matter and Quantity, to form the complete Sensible Substance; this Substance, so called, may be supposed to constitute the manifold world of Sense, which is not so much an essence as a *quale*. Thus, for the essence of fire we must look to the Reason-Principle; what produces the visible aspect is, properly speaking, a *quale*.

Man's essence will lie in his Reason-Principle; that which is perfected in the corporeal nature is a mere image of the Reason-Principle, a *quale* rather than an essence.

Consider: the visible Socrates is a man, yet we give the name of Socrates to that likeness of him in a portrait, which consists of mere colours, mere pigments: similarly, it is a Reason-Principle which constitutes Socrates, but we apply the name Socrates to the Socrates we see: in truth, however, the colours and shapes which make up the visible Socrates are but reproductions of those in the Reason-Principle, while this Reason-Principle itself bears a corresponding relation to the truest Reason-Principle of Man.—But we need not elaborate this point. (VI.3.15, 23–37)

Unfortunately, Plotinus did not think it necessary to elaborate the point which he is making here, though an elaboration would be most welcome. He seems to distinguish between *logos* of man (i.e. definition, or 'Reason-Principle,' as MacKenna renders it) and *logos* of individual man, e.g. Socrates. But it is not clear (a) on what grounds this distinction is based, and (b) what is meant by *logos* in the case of Socrates. If we interpret *logos* in the second case as having the same meaning as in the first case, then it would seem to follow that for Plotinus even individuals are definable, which Aristotle had denied." Such an interpretation may lead to the further hypothesis that Plotinus accepted 'Forms' of individuals, as has been suggested by modern scholars.\* But it is possible that *logos* in the second case (i.e. *logos* of Socrates) does not mean 'definition' as in the first case, but rather description." Thus, while the '*logos* of man' will give the essence (*ti esti*) of man in general, the '*logos* of Socrates' will qualify and specify—more precisely, atomize—the 'individual' (*ti*) by adding a collection of (accidental) properties, so that it will produce a 'qualified something' (*poion ti*). In this light, the meaning of the above quotation will be the following: As the portrait of Socrates stands to the living sensible Socrates, so the *logos* (*hypographē*) of Socrates (the individual man) stands to *logos* (definition) of man (the universal). The implication of this analogy is that the universal is more real than the particular, in spite of all Aristotelian assertion to the contrary.

### III

With regard to Quality, considered as a separate 'genus' of the Sensible world, there are three main issues which Plotinus discusses: (a) Its distinction from the other 'genera,' (b) its different kinds, and (c) its special characteristics—i.e. its *idia*, as Porphyry called them. Of these three issues it is on (a) that Plotinus' views come very close to Aristotle's.

On (b) and (c), their views diverge, as will become clear from the discussion which follows.

It has been repeatedly stated by Plotinus that the sensible substance or 'pseudo-substance' (*legomenē*) is not simple but complex. It is the amalgam, the concrescence or coming together of many entities (*to ek pollōn*: VI.3.15, 26). Its constituents are not only Matter and Form but also Quantity, Quality, and Motion or absence of Motion, according to Plotinus. Quality, taken separately from the amalgam, can be said to signify 'the distinct mark' or 'the type of a thing.' Thus:

When each of the entities bound up with the pseudo-substance is taken apart from the rest, the name of Quality is given to that one among them, by which without pointing to essence or quantity or motion we signify the distinctive mark, the type or aspect of a thing—for example, the beauty or ugliness of a body. This beauty—need we say?—is identical in name only with Intellectual Beauty: it follows that the term 'Quality' as applied to the Sensible and the Intellectual is necessarily equivocal. (VI.3.16, 1–7)

It is important to note here the 'equivocation' of the term 'Quality' as applied to the two realms—the Sensible and the Intelligible—because Plotinus' discussion in the next several pages seems to rest on this homonymy. On this basis he distinguishes the virtues, arts and sciences which are classed with 'Sensible Quality' from those which "necessarily belong to the...Intellectual." He states:

Geometry and arithmetic are, we shall maintain, of a twofold character: in their earthly types they rank with Sensible Quality, but in so far as they are functions of pure Soul, they necessarily belong to that other world in close proximity to the Intellectual. This, too, is in Plato's view the case with music and astronomy.

The arts concerned with material objects and making use of perceptible instruments and sense-perception must be classed with Sensible Quality, even though they are dispositions of the Soul, attendant upon its apostasy.

There is also every reason for consigning to this category the practical virtues whose function is directed to a social end: These do not isolate Soul by inclining it towards the higher; their manifestation makes for beauty in this world, a beauty regarded not as necessary but as desirable. (VI.3.16, 19–31)

The outcome of this procedure would seem to be, as Plotinus realizes, "a distinction between psychic and bodily qualities, the latter belonging specifically to body" (VI.3.17, 1–2). By subdividing the psychic and

bodily qualities, many and different kinds of Quality may be obtained, which are not the same as those presented in the *Categories*." But here a serious question is raised and discussed by Plotinus: How is it possible to divide Quality into different kinds? For such a division, *differentiae* are needed. Where are they to be found? If qualities (*poiotētes*) serve as differentiae of substances (*diaphorai ousias*), then what would serve as differentiae of qualities (*diaphora poiotētos*)? It cannot be qualities, because that "would be no less absurd than setting up substances as differences of substances." The problem is not solved even if we take as basis for the distinctions of different kinds of qualities 'the variety of sense-organs':

Here a difficulty may be raised: we divide the varieties of Substance and their functions and activities, fair or foul or indeed of any kind whatsoever, on the basis of Quality, Quantity rarely, if ever, entering into the differences which produce species; Quantity, again, we divide in accordance with qualities of its own: how then are we to divide Quality itself into species? what differences are we to employ, and from what genus shall we taken them? To take them from Quality itself would be no less absurd than setting up substances as differences of substances.

How, then, are we to distinguish black from white? how differentiate colours in general from tastes and tangible qualities? By the variety of sense-organs? Then there will be no difference in the objects themselves.

But waiving this objection, how deal with qualities perceived by the same sense-organ? (VI.3.17, 3–19)

Eventually Plotinus accepts the view that not all qualities constitute differentiae (VI.3.18, 16–20). He then proceeds to put down as a rule that (a) "Quality is never a differentia of quality, any more than Substance is a differentia of substance, Quantity of quantity" (VI.3.18, 30–33); and (b) "while in general it is necessary to look for differences by which to separate things from each other, to hunt for differences of the differences themselves is both futile and irrational" (VI.3.18, 1–3). The reason why it is futile to seek for 'differences of differences' is not difficult to understand, though not stated by Plotinus. For, it would seem that such an attempt leads to an infinite regress. But it is not clear on what grounds such a procedure can be characterized as irrational. Perhaps the reason for this is to be found in that only essential qualities (*ousiōdeis poiotētes*) can serve as differentiae by means of which definitions are obtained. Now, definitions seem indispensable to discursive reason in performing its function, which is to give explanations supported by arguments. But

sense-perception and intellect, as cognitive faculties, can dispense with definitions and arguments, since they do not aim at explanation, as Plotinus puts it:

Sense-perception and intelligence may be trusted to indicate diversity but not to explain it: explanation is outside the province of sense-perception, whose function is merely to produce a variety of information; while, as for intelligence, it works exclusively with intuitions and never resorts to explanations to justify them; there is in the movements of intelligence a diversity which separates one object from another, making further differentiation unnecessary. (VI.3.18, 7–12)

In connection with the problem of the different kinds of qualities and the basis of their differentiation, it should be noted that Plotinus agrees here with Aristotle in grouping together (though with some qualifications) qualities and *qualia*. The qualifications suggested here by Plotinus are as follows:

With Quality we have undertaken to group the dependent *qualia*, in so far as Quality is bound up with them; we shall not however introduce into this category the qualified objects (*qua* objects), that we may not be dealing with two categories at once; we shall pass over the objects to that which gives them their (specific) name. (VI.3.19, 1–4)

In so far as the 'peculiar characteristics' (*idia*) of quality are concerned, it may be recalled that Aristotle asserted in the *Categories* that qualities admit (a) contraries and (b) a more and a less. Plotinus has some objections with regard to both (a) and (b). First of all he can not accept the Aristotelian view of contrariety as 'the greatest possible difference.' He rejects it by arguing in the following way:

It may be urged that the products of a contrariety exhibit the greatest diversity. But 'the greatest diversity' is clearly meaningless, unless we can point to lower degrees of diversity in the means. Thus, we cannot speak of 'the greatest diversity' in reference to health and disease. This definition of contrariety is therefore inadmissible. (VI.3.20, 20–23)

Secondly, Plotinus accepts the basic Aristotelian distinction between contraries without intermediaries (*amesa*) and contraries with intermediaries (*emmesa*).<sup>20</sup> Thus, health and sickness, for example, belong to the former, while virtue and vice or black and white belong to the latter.

But there is a difference between these last two examples which Plotinus tries to clarify:

We have to ascertain whether there is not to every quality a contrary. In the case of virtue and vice even the mean appears to be contrary to the extremes.

But when we turn to colours, we do not find the intermediates so related. If we regard the intermediates as blendings of the extremes, we must not posit any contrariety other than that between black and white, but must show that all other colours are combinations of these two. Contrariety however demands that there be some one distinct quality in the intermediates, though this quality may be seen to arise from a combination. (VI.3.20, 1-7)

Hence the conclusion seems to follow that:

If these observations be sound, colours which have a common ground will not be contraries. But there will be nothing to prevent, not indeed every colour from being contrary to any other; and similarly with tastes.—This will serve as a statement of the problem. (VI.3.20, 35-38)

As for (b) Plotinus thinks that only *qualia*—objects participating in Quality—admit of degrees, but Quality as such is excluded:

As for Degree (subsisting in Quality), it was given as our opinion that it exists in the objects participating in Quality, though whether it enters into qualities as such—into health and justice—was left open to question. If indeed these qualities possess an extension quite apart from their participants, we must actually ascribe to them degrees: but in truth they belong to a sphere where each entity is the whole and does not admit of degree. (VI.3.20, 39-42)

#### IV

Can Motion be established as a 'genus' of the Sensible world? This question has to be considered first for two reasons: (1) Because Aristotle did not consider Motion as one of his categories; and (2) because Plotinus thinks that the positing of Motion as a new 'genus' is possible. Plotinus' claim depends on three conditions which he specifies as follows:

- (a) "That it cannot rightly be referred to any other genus";
- (b) "That nothing higher than itself can be predicated of it in respect to its essence";

- (c) "That by assuming differences it will produce species" (VI.3.21, 1-5).

With regard to (a) Plotinus argues that Motion (*kinēsis*) cannot be referred to any other of the 'genera' which he has postulated for this world. According to him, Motion is neither Substance, nor quality, nor quantity, nor relation. It is, as Plotinus puts it, *heteron*: other, something else, different. It cannot be Substance because it presupposes Substance. Although attributive, Motion has an independent reality in the same sense in which Quantity and Quality are said to have independent realities. It is this characteristic which distinguishes Motion from Relation. Plotinus explains:

If we are agreed that Quality and Quantity, though attributive, are real entities, and on the basis of this reality distinguishable as Quality and Quantity respectively: then, on the same principle, since Motion, though an attribute, has a reality prior to its attribution, it is incumbent upon us to discover the intrinsic nature of this reality. We must never be content to regard as a relative something which exists prior to its attribution, but only that which is engendered by Relation, and has no existence apart from the relation to which it owes its name. (VI.3.21, 12-17)

Before proceeding to answer the question "What is that entity, called Motion, which, though attributive, has an independent reality, which makes its attribution possible?" Plotinus finds it necessary to make sure that "there is nothing prior to Motion and predicated of it as its genus" (VI.3.21, 21-24). This was condition (h) as stated above. Change (*metabolē*) is the most serious candidate to be considered as 'genus' of Motion. But upon inspection it appears to be a species rather than the 'genus' of Motion, because "change signifies merely the substitution of one thing for another, whereas Motion involves also the removal of a thing from the place to which it belongs, as is shown by locomotion" (VI.3.21, 42-44). It may also be the case that 'change' is but another name for Motion, because if it were another 'genus,' then the genera would have to be not five but six (VI.3.21, 25-26)."

Since change is not the only species of Motion, as Plotinus understands it, he goes on to specify its other species (*eidē*). Among them are to be found not only generation (*genesis*), alteration (*alloiōsis*) and augmentation (*auksē*) (chapter 21) but also actions (*poiēseis*) and passions (*peiseis*) (chapter 28). Accordingly, the condition (c) is satisfied and, therefore, Motion is established as a 'genus' of Becoming. An additional reason that Motion, in Plotinus' view, must be considered as one of the

highest 'genera' is the fact that it can not be defined: "That Motion is a genus we may be all the more confident in virtue of the difficulty—the impossibility even—of confining it within a definition" (VI.3.22, 19–21).

Having established in this way that Motion is a 'genus,' Plotinus felt it necessary to search for the 'constant element' of this 'genus' which appears in all its species. The outcome of this search is stated in the following passage:

In short, the common basis of all Motion is the existence of a progression and an urge from potentiality and the potential to actuality and the actual: everything which has any kind of motion whatsoever derives this motion from a pre-existent potentiality within itself of activity or passivity. (VI.3.22, 47–50)

Accordingly, "the view would not be unreasonable which, taking some Forms to be active, others inactive, regarded Motion as a dynamic Form in opposition to the other Forms which are static, and further as the cause of whatever new Form ensues upon it" (VI.3.22, 12–16)."

In addition to its being a dynamic Form, Plotinus characterizes Motion as (a) "passage from potentiality to its realization" (VI.3.22, 3–4); (b) "being itself perpetual difference" (*aei heterotēs*) (VI.3.22, 43–44); (c) being distinguished from 'moved objects,' since "by walking we do not mean the feet but the activity springing from a potentiality in the feet" (VI.3.23, 4–5), and (d) "being always qualified" and "taking its quality from the moved" (VI.3.23, 31–33). Thus:

Now, when the potentiality of Motion consists in an ability to walk, it may be imagined as thrusting a man forward and causing him to be continually adopting a different position; when it lies in the capacity to heat, it heats; when the potentiality takes hold of Matter and builds up the organism, we have growth; and when another potentiality demolishes the structure, the result is decay, that which has the potentiality of demolition experiencing the decay. Where the birth-giving principle is active, we find birth; where it is impotent and the power to destroy prevails, destruction takes place—not the destruction of what already exists, but that which intervenes upon the road to existence. (VI.3.23, 20–28)

In chapter 24 Plotinus considers the contrary motions with regard to locomotion, such as: ascending and descending, circular and linear. He concludes that "it appears in general that locomotion is a definite unity, taking its differences from externals" (VI.3.24, 14–15). As for integration (*synkrisis*) and disintegration (*diakrisis*), which are considered in the next

chapter (chapter 25), Plotinus thinks that (a) they should not be identified with condensation (*pyknōsis*) and rarefaction (*araiōsis*) because "to suppose that they were would involve the admission of a vacuum" (VI.3.25, 34), and (b) they are in a sense reducible to local motions. For:

If integration implies that one element proceeds towards another, implies in short an approach, and disintegration, on the other hand, a retreat into the background, such motions may be termed local; we have clearly a case of two things moving in the direction of unity, or else making away from each other. (VI.3.25, 5–9)

The last point which Plotinus discusses with regard to Motion is its opposite. Whether this opposite is Stability (*stasis*) or Rest (*ēremia*) is problematic. The distinction between these two notions is subtle and must be carefully considered. Their difference consists in that the former belongs to that which is immovable (*akineton*), while the latter pertains to that which is movable (*kineton*) but for some reason rests or has come to a stop. In this respect, it is understandable that "we should, no doubt, be well advised to assign Stability to the Intellectual, and to look in the lower sphere for Rest alone" (VI.3.27, 3–4). Accordingly, Rest appears to be the negation of Motion in the Sensible realm, though in the Intelligible realm Stability does not negate Motion.

Why, then, did we not in discussing the Intellectual realm assert that Stability was the negation of Motion? Because it is not indeed possible to consider Stability as an annulling of Motion, for when Motion ceases Stability does not exist, but requires for its own existence the simultaneous existence of Motion; and what is of a nature to move is not stationary because the Stability of that realm is motionless, but because Stability has taken hold of it; in so far as it has Motion, it will never cease to move: thus, it is stationary under the influence of Stability, and moves under the influence of Motion. In the lower realm, too, a thing moves in virtue of Motion, but its Rest is caused by a deficiency; it has been deprived of its due motion. (VI.3.27, 27–35)

The implication is that Stability is not to be found in this Sensible world in which everything is either in Motion or at Rest, that is, in slower or relative Motion. In other words, every entity of the Sensible world must be always in Motion in reference to the Absolute Stability of the Intelligible realm. And there is no other frame of reference. Plotinus argues:

Now, if Rest means coming to rest, it must be regarded as a motion which has not yet ceased but still continues; but if we suppose it to be incompatible with Motion, we have first to ask whether there is in the Sensible world anything without motion. (VI.3.24, 11–14)

This then is Plotinus' theory of relative Motion in the Sensible world."

## V

The last and short chapter of the present tractate (chapter 28) is devoted to the fifth 'genus' of Becoming—i.e. Relation (*pros ti*)—which was discussed at length in the first tractate. In passing, Plotinus notes that: (a) "We have already indicated that Activity and Passivity are to be regarded as motions:" and (b) "as for the remaining so-called genera, we have shown that they are reducible to those which we have posited" (VI.3.28, 1–4). Then he states the following with regard to Relation, which he had characterized as 'manifestly an offshoot' (VI.2.16, 1):

With regard to the relative, we have maintained that Relation belongs to one object as compared with another, that the two objects coexist simultaneously, and that Relation is found whenever a substance is in such a condition as to produce it; not that the substance is a relative, except in so far as it constitutes part of a whole—a hand, for example, or head or cause or principle or element. (VI.3.28, 4–8)

Consequently, Plotinus seems to agree with Aristotle in that (1) relations are closely connected with substances; (2) they presuppose a plurality (at least two) of substances which must exist simultaneously; and (3) no substance is a relative. This last point, it may be recalled, was very controversial. It was discussed by Aristotle at length in the *Categories* and was the main reason why he modified the definition of relatives. Unlike Aristotle, Plotinus is prepared to accept that in some cases Substances can be regarded as relatives. These cases are specified as parts, causes, principles and elements. Now, Aristotle might have objected to this, that in all these cases substances are not considered substances. As Porphyry puts it, it is not Socrates *qua* primary Substance, but Socrates *qua* father of his sons, who can be regarded as a relative (efficient cause)."

At the end of his discussion, Plotinus mentions an ancient division of relatives which reads as follows:

We may adopt the ancient division of relatives into creative principles, measures, excesses and deficiencies, and those which in general separate things on the basis of similarities and differences. (VI.3.28, 8–11)

In this light, it is easy to see how the category or 'genus' of Relation was able, in the Plotinian scheme, to absorb all the Aristotelian categories except for Substance." Although this development led Plotinus away from Aristotle's categorial many-fold, it certainly brought him back to the old Platonic dichotomy between Substance and Relation, or Absolute and Relative Being, as is customary to render the Greek expressions *kathauto on* and *en allō on*. Having thus determined the number and nature of the 'genera' of Becoming, Plotinus closes the tripartite treatise 'On the Genera of Being' with the satisfaction that he has provided a set of five categories which is sufficient, he thinks, to account for this Sensible cosmos, the image and reflection of the Intelligible cosmos.

## VI

It was the purpose of this study to examine Plotinus' proposal of a new set of categories or so-called 'genera' of Becoming and its relationship to Aristotle's categories most of which Plotinus found redundant and, therefore, reducible. In view of Plotinus' criticism and rejection of the Aristotelian categorial set as presented in VI 1, it was necessary to emphasize the point that in VI 3 Plotinus was concerned with finding a new set of categories. Since Aristotle's categories in their ontic claims had been found inadequate to account for the Intelligible realm and had been rejected in favor of Plato's 'highest kinds', Plotinus thought it necessary to restrict his investigations to the Sensible realm in order to examine the applicability of the Aristotelian scheme to the sensible cosmos (*kosmos aisthētos*). Because of this restriction, Plotinus also thought that one should not speak of 'genera of Being' but rather of so-called 'genera' or categories of Becoming in view of the all-important Platonic and Neoplatonic ontological distinction between the Sensible cosmos and the Intelligible cosmos. The dangers of homonymy are always present in Plotinus' mind and this explains a great deal of both the terminology he uses and the criticism he advances against his predecessors. As revealed in the preceding discussion and analysis, Plotinus' views can be summarized as follows:

1) Given their ontological inadequacy, the applicability of Aristotle's set of categories must be restricted to the realm of Becoming. But even within this realm, the Aristotelian number of ten categories is too large compared to the five genera which Plotinus found sufficient to account for the realm of Being.

2) Plotinus recommends a drastic reduction of Aristotle's categories which amounts to fifty percent, and justifies it on the grounds that the omitted categories are redundant and reducible, or that they are more specific than general, or that they lack the required unity and simplicity. Thus six Aristotelian categories are absent from the Plotinian set, because they fail to meet these criteria.

3) Even those of Aristotle's categories which can pass the Plotinian tests of generality, unity, simplicity, and irreducibility must be modified before they can be accepted as 'genera' of Becoming in the Plotinian sense of the term. The specific ways of such modifications and Plotinus' arguments to support them we have seen in our discussion above in detail.

4) Of the five categories for the Sensible world to be found in Plotinus' list four correspond, at least in name, to Aristotle's categories of Substance, Quantity, Quality, and Relation. The fifth Plotinian category, Motion, which substitutes for Aristotle's categories of Action and Passion, has certainly a Platonic origin, since it is found also in the list of Plato's 'highest kinds'.

5) In some sense, then, the Plotinian categorial scheme comprises elements borrowed from Plato and Aristotle. It was left to Porphyry to effectively continue and deepen this process of reconciling the two philosophies, so that he can be rightly considered as the originator of an Aristotelian Neoplatonic tradition regarding Aristotle's doctrine of the categories.

6) The important point to keep in mind is that Plotinus remained to the end anti-Aristotelian regarding the doctrine of the categories, in spite of all the borrowings and similarities in terminology. Since he could not accept Aristotle's categories in their ontological claims, and since he had to restrict their application to the realm of Becoming, it was inevitable that the function of Plotinus' new categories would be formalistic and nominalistic, as has been observed."

# NOTES

1. For a more extensive discussion of the issues addressed in this essay, see my *Aristotle's Categories and Porphyry*, *Philosophia Antiqua* 48 (Leiden: E. J. Brill, 1988).
2. I have discussed this problem in "Plotinus' Anti-Gnostic Polemic," *Neoplatonism and Gnosticism*, eds. R. Wallis and J. Bregman (Albany: ISNS & SUNY Press, 1992), 111-128.
3. In all probability, Plotinus' Gnostic opponents were Christians. However, for the Neoplatonists of that time, both movements, Gnosticism and Christianity, were considered as barbaric in spirit, that is, non-Hellenic. (See my "Plotinus' Anti-Gnostic Polemic.")
4. The expression used by Plotinus is *kosmos noēas*.
5. The division of the treatise into three parts is probably due to Porphyry's editorial intervention to reach the desired number, 54 (i.e. 6 x 9).
6. Especially, 254a-256e.
7. Enneads VI.2.1, 19-20: MacKenna's translation, which I shall follow throughout unless stated otherwise.
8. In Plotinus' view, the expression 'genera of Being' can be properly used only in reference to *kosmos noēas*. As for the so-called 'genera' of Becoming, they should be termed 'categories' because they lack real generic power and unity. On this point, see VI.1.5, 22-26; VI.1.9, 27-30; and VI.1.10, 40-42.
9. The exception is Motion (*kinēsis*), which is not a category for Aristotle.
10. *The Philosophy of Plotinus* (New York: Longmans, 1948), 194.
11. It has been reported that Porphyry was the author of two commentaries on the *Categories*: see Simplicius, *Commentaria in Aristotelem Graeca* VIII, ed. C. Kalbfleisch (Berlin, 1907), 1-2.
12. For Aristotle's conception of homonymy, or rather *homōnymia ontā*, see the opening paragraph of the *Categories*.
13. With regard to simplicity and unity the three *Hypostaseis* are characterized as follows:
  - a. The One as *pantelōs hen* (Absolute Unity) (VI.2.9, 30) and *adiaphoron on* (Undifferentiated Being) (VI.2.9, 9).
  - b. The *Nous* as to *ek pantōn* (Unity in Plurality) (VI.2.19, 9) and *holon hen* (Total Unity) (VI.2.6, 16).
  - c. The Soul as *polla kai hen* (one and many) (VI.2.4, 31-32).
14. That is the reason why they lack the unity which a genus of Being must possess.
15. Plotinus occasionally refers to this entity as *syntheton* or *synamphoteron*—meaning that which is made up of two entities, Matter and Form.
16. That is to say, the Form of a human being.
17. *Categories* 3a21-27.
18. *Categories* 1b3-8.

19. I have dealt with the problem of essential and accidental predication and its role in determining the nature of Aristotle's four predicables in "Aristotle's Theory of Predicables and Porphyry's *Isagoge*," *Journal of the History of Philosophy* 23 (1985), 15–35.
20. This Plotinian doctrine is in sharp contrast to Aristotle's doctrine that *ousia* is not dependent. In *Metaphysics* he states: "Of the other categories none can exist independently but only substance" (1028a35–35). Also *Categories* 2a34–35.
21. E. G. W. Leszl uses the expression 'focality of meaning' in *Logic and Metaphysics in Aristotle* (Padua: Editrice Antenore, 1970), 99. Aristotle's expression for this is *pro hen legomenon*.
22. In VI.3.8, 19–20, we are told that the sensible substance is *symphorēsis tis poioteōn kai hylēs* (a concrescence of matter and qualities: translation mine).
23. *Isagoge*, 4 (21–25).
24. *Categories* 2a11–18.
25. Commentary to the *Categories*, 91 (4–27).
26. In this way homonymy, which was used by Aristotle for cases such as a living human being and its portrait, is extended by Plotinus so as to cover the whole Sensible universe.
27. The question of self-predication of the Forms in the *Enneads* has been ably discussed by J. Rist in *Eros and Psyche* (Toronto: University of Toronto Press, 1964), 59–61.
28. *Categories* 5b11 ff: 'a quantity has no contrary.'
29. The same examples of 'few and many' have been used by Aristotle, *Categories* 5b.
30. According to Aristotle, "it is most of all with regard to place that there seems to be contrariety of a quantity" (*Categories* 6a11–12). See also Porphyry's *Commentary*, 107–108.
31. It may be noted here that geometrical figures (*schemata*) were considered as a kind of quality by Aristotle: *Categories* 10a11–15.
32. *Categories* 11a15–19.
33. *Categories* 3b10–23.
34. *Metaphysics* 1029b13, 20, 27; 1031b9; 1032b14; 1035b16.
35. For Aristotle, individuals admit the definition of their species (*Categories* 2a19–34).
36. On this see J. Rist, *Plotinus: The Road of Reality* (Cambridge: Cambridge University Press, 1967), 86–87.
37. *Hypographe* is used by Porphyry and other commentators to give a description of concepts, like the highest genera, which cannot be defined by genus and differentia.
38. *Categories*, chapter 8.

39. In *Metaphysics* (1061a12) Aristotle identified contrarities with 'the first differences of being' (*protas diaphoras tou ontos*). Also, *Categories* 6a17–18.
40. *Categories* 11b38–12a25.
41. In *Physics* 18b19 and *Metaphysics* 1065b14, Aristotle uses *kinēsis* and *metabole* as synonyms.
42. This remark echoes the *Sophist* 247e, where Plato states: "I am proposing as a mark to distinguish real things that they are nothing but power."
43. *Physics* 201a11: *he tou dynamei ontos entelecheia*.
44. A comparative study of Plotinus' theory of Motion and Einstein's theory of Relativity should be interesting.
45. Porphyry's *Commentary*, 140–141.

# SYMPATHY: STOIC MATERIALISM AND THE PLATONIC SOUL

Gary M. Gurtler

Sympathy holds a unique place in Plotinus' philosophy of nature. It seems, on the one hand, to be simply a characterization of the organic unity of the physical cosmos. From this point of view, sympathy becomes the explanatory key for prayer, magic and divination as diverse ways in which parts of the cosmos influence and interact with one another.<sup>1</sup> But, on the other hand, this organic unity is essential for Plotinus' thematization of sensation and perception. Thus sympathy also has a role in Plotinus' anthropology, playing the objective correlate to the subjective unity of consciousness, signified by the term *synaisthesis* ('consciousness'). Both of these terms derive from Stoic sources and both require appropriate dematerialization to fit the overall Platonic character of his thought, but in each case the appropriate dematerialization is close to being opposite. *Synaisthesis* is almost totally dematerialized and, consequently, its elaborate structure can be applied to any level in the hierarchy of reality, whereas sympathy needs only the bare minimum of dematerialization for its function in the sensible world.<sup>2</sup>

Using these two terms, sympathy (*sympatheia*) and consciousness (*synaisthesis*), moreover, Plotinus is able to construct a comprehensive account of nature and experience. This account is comprehensive in a new and original way. It attempts to combine the work of Plato and Aristotle, where the internal operations of the soul are analyzed, with the Stoic emphasis on the necessary organic unity of the cosmos as the external basis for perceptual awareness of any kind. It, thus, addresses simultaneously the two opposite poles of experience: the unity of the external world and the unity of the internal states of awareness or knowing.

It is part of Plotinus' genius to see these two aspects of experience and, in addition, to construct a theory that will handle both of them adequately.<sup>3</sup> In articulating the unity of a subject's interior cognitive states,

for example, he faces the problem of other minds with a directness that disappeared in much of classical modern thought, only to be labored over anew by contemporary thinkers. It is not enough to unify the experiences of one mind alone, but the unity must include all other minds, without at the same time sacrificing the integrity of individual experience. From the side of the object, there is a similar bifocal character. Thus, it is not enough to posit a multitude of independent external objects that can be sensed and known, but this multiplicity of objects must already form a unity before sensation or knowledge can take place. Mere physical juxtaposition is not sufficient to explain sensation or perception, but only the cosmic unity established through the analysis of sympathy.

The elaboration of sympathy, finally, shows Plotinus' method of philosophizing, borrowing from the major traditions of Greek philosophy, but making the changes and adaptations necessary for the consistency of his own system. In this instance, the Stoic term, *sympathy* fills out the Platonic notion that the universe is a single living organism (*Timaeus* 30d3–31a1). The change is simple but radical: Stoic materialism must be replaced with the immateriality of the Platonic soul. Sympathy, like *synaisthesis*, is thus rooted in the soul, but the difference is that the relevant soul for sympathy is the world soul and not the individual soul at the center of human consciousness. With this accomplished, Plotinus can adapt the Stoic analysis of sympathy to explain the elusive Platonic characterization of the universe as a single living thing.

## 1. Against Materialism

Four treatises in Plotinus' first period (A.D. 253–263), use sympathy in two major contexts: the inadequacy of materialism to explain the sympathy within or between beings and the corresponding reduction of sympathy to the soul. Finally, a unique usage of sympathy is broached in two treatises, I.2[19] and VI.4[22], overlapping the first and second of Plotinus' literary periods and showing a continuity of issues arising in different contexts. The problem giving rise to this usage is the problem of evil, a difficult point in relating a Platonic soul to the material world.

### 1.1 Soul as Principle of Unity

The first series of treatises to be analyzed come from the very first years of Plotinus' writing, A.D. 254–258, with their focus primarily on the relation of soul and body and secondarily on the interrelation of bodies in the cosmos. Thus, the treatise, 'On the Immortality of the Soul' (IV.7[2]), is a scholastic defense of the Platonic doctrine of the soul's nature and immortality, arguing against the materialistic views of the Epicureans and Stoics as well as the non-materialistic, but still objectionable, views of the Pythagoreans (the soul as a harmony) and the Peripatetics (the soul as entelechy). In the subsequent treatise, 'On Destiny' (III.1[3]), Plotinus shifts to a defense of Platonic causation, with the freedom and integrity of the soul opposed to the determinism of the astrologers and their materialistic allies, the Stoics and Epicureans.

The treatise, 'On the Essence of the Soul' (IV.2[4]), returns to the problem of the nature of the soul and its relation to bodies by introducing the scheme of the indivisible and divisible from *Timaeus* 35a1–4. As applied to the dualism of soul and body, this yields a fourfold structure, with its three higher elements presaging the structure of unity that emerges with more and more clarity in later works. The last treatise in this section, 'If All Souls Are One' (IV.9[8]), in fact, summarizes these earlier discussions on the nature of the soul and points forward, as Armstrong (IV, 427) notes, to the richly complex analyses in VI.4 & 5[22 & 23] and IV.3[27].1–8. Igal, for his part, maintains that this treatise presents the first hesitant attempt to distinguish individual souls and the world soul from the Hypostasis Soul as Plotinus gropes for a way to express adequately the unity and individuality of souls (III–IV, 545–548).

In these discussions of soul, Plotinus gradually unfolds the structure and meaning of sympathy. In IV.7[2], the passage containing sympathy argues against the atomism of the Epicureans.

But if someone says that it is not so, but that atoms or things without parts make the soul when they come together by unity and community of feeling [*homopatheia*], he could be refuted by their [mere] juxtaposition, and that not a complete one, since nothing which is one and united with itself in community of feeling [*sympathous*] can come from bodies which are without feeling [*apathon*] and unable to be united, but soul is united with itself in community of feeling [*sympathes*]. But no body or magnitude could be produced from partless constituents. (IV.7.3, 1–6: Armstrong translation)

Plotinus, in his usual fashion, is using the same argument to cover two points: Epicurean atomism and Stoic materialism. With a twinge of irony, he uses Stoic sympathy to indicate the absurdity of the atomists and then the inconsistency of the Stoics themselves, an argument which continues to IV.7.8<sup>2</sup>. The attack on the atomists is more fundamental, since their position renders explanation and experience impossible. These Epicureans may not have been troubled by the lack of explanation, but Plotinus presses home to the actual problem of their position, that the world itself becomes absurd and impossible. Atoms, Plotinus reasons, can only be next to one another. They cannot be formed into unities with some kind of common feeling, since their juxtaposition is never complete and their interaction only mechanical.

His alternative theory derives from Plato's *Timaeus*,<sup>3</sup> with its four elements and Platonic soul. Plotinus adding only the qualification that the soul is sympathetic to itself. This extremely laconic description should not serve to discount its crucial importance in Plotinus' argument, for in establishing the connection between sympathy and the soul, he is moving toward that first level in his structure of unity, a transcendent source in relation to those things which participate in it on a lower and more multiple level. The description of the soul as self-sympathetic also removes at the same stroke Stoic materialism. Sympathy is a function of the immaterial Platonic soul, and it is, consequently, from soul that it derives its power to unify the realm of bodies.

In the present context, however, Plotinus only states his position, with its development in the later treatises to be considered actually showing some evolution in his thought as he struggles to articulate the intricate relation of soul and body. Finally, the alternative explanation of atomism in this passage (IV.7.3, 5–6), that things without parts make the (corporeal) soul when they come together, is dismissed with utmost brevity: No body or magnitude is derived from what is partless. As Bréhier points out, this is the habitual mistake of confusing the mathematical point with the physical atom (IV, 191 n2). Thus atoms are eliminated because they cannot be unified, and partless things because they add up to nothing. Soul, on the other hand, has the power to unify what is lower and more dispersed than itself, with sympathy the description of this unifying power.

When Plotinus turns to the discussion of causation in the treatise, 'On Destiny' (III.1 [3]), he maintains that the Platonic account is more complete than the Aristotelian (III.1.1 & 2) and more cogent than the various forms of determinism, whether Epicurean or specific types of Stoicism (III.1.3–7). The discussion thus hinges on the conflict between the

immateriality of the Platonic soul and various forms of materialism, or, as expressed here, between freedom and determinism. Plotinus begins by accepting the evidence of the astrologers for the causal role of the sphere of the stars and the wandering planets, disagreeing only with their interpretation.

The evidence for this is that by divination from the planets people foretell what is going to happen in the All and about each individual, what sort of fortune and, in particular, what sort of thoughts he is going to have. And they say that one can see that the other animals and plants grow and diminish under the sympathetic influence [*sympatheias*] of the planets, and are affected by them in other ways; and the regions of the earth differ from each other according to their position in relation to the All, and particularly to the sun; and not only do the other animals and plants correspond to the regions but also the forms and sizes and colours, the tempers and desires and ways of life and characters of human beings. (III.1.5, 4–15: Armstrong translation)

The neuralgic point is the attribution to the stars and planets of a direct causal role in human thought and character, undermining the nature of the Platonic soul as an independent substance. This passage thus gives the *aporia* to be resolved in the exposition of his own position in III.1.8–10.

Plotinus' solution is to situate the human soul within the context of the universe as a whole. Thus any limitation on human freedom is due to the interweaving of a multitude of cosmic factors, including the individual's own choices, and not to a denial of freedom as such. From this point of view, the sympathy mentioned in this passage is a positive contribution to his own argument. By rooting sympathy in the soul, Plotinus derails the kind of complete causality operative in the materialistic view of the astrologers, and substitutes a concatenation of causes that is ultimately traceable to soul itself. At the same time, a secondary aspect of sympathy is introduced, the interrelation of the participants within a comprehensive whole.

The last treatise in this initial trilogy, 'On the Essence of the Soul' (IV.2 [4]), is a short addition to IV.7 [2], in which Plotinus establishes a further dichotomy in being and becoming, yielding a fourfold division. Thus, in the realm of being, there is the primary indivisible, the Intellect itself, and the secondary indivisible, the soul; and in the realm of becoming, the secondary divisible, the forms immanent in bodies, and the primary divisible, sensible magnitude and mass.<sup>4</sup> Appropriately, sympathy occurs in the section dealing with the secondary indivisible, the soul.

But again, next to that altogether indivisible nature there is another reality following upon it and deriving from it, having indivisibility from that other nature, which pressing eagerly on in its progress from the one to the other nature, established itself in the middle between the two, the indivisible and primary and the 'divisible which is in the sphere of bodies', which is upon bodies: [it does] not [behave] in the same way in which every colour and quality is the same in many places and many bodily masses, but the quality or colour in one mass is totally separate from that in the other, just as much as one mass is separate from the other; and even if the magnitude is one, yet what is the same in each part has no community [with any other] leading to a common experience [*homopatheian*], because this 'same' is one thing here, another there: for what is the same is an affection [*pathema*], not the same substance. (IV.2.1, 41–53: Armstrong translation)

In the first part of the passage, the soul is established as between that which is indivisible essentially (the Intellect) and that which is divisible in the sphere of bodies (the qualities of bodies). Soul is thus between the primary indivisible and the secondary divisible, and will be characterized by attributes of both.

Unwittingly, Plotinus has stumbled on the structure of unity that will dominate his later discussions, a completely unified source, individually unified beings, and something in between which unifies these individual beings by its closeness to the source. In the present context, however, the groundwork for this structure is still being established. Central to this enterprise is the carefully wrought distinction between qualities and soul as they relate to bodies. Qualities are formally the same wherever they occur, but are numerically distinct and separate as attributes of material bodies. Soul, on the other hand, because it is a substance and not merely an affection of a body, keeps the indivisible nature it shares with the Intellect, and thus is divisible in bodies without loss of its integral unity.

The term in which this dual character of the soul comes to focus is sympathy, which describes the particular kind of unity soul gives to bodies that goes beyond mere physical juxtaposition. The present passage offers, therefore, an important clarification of the discussion in IV.7.3 by its more precise distinction between physical proximity and sympathetic unity. At the same time, it prepares for later discussions by its sharper focus on the relevant issues, the comparison of soul and qualities in relation to body and the very structure implicit in the fourfold division of being.

The next treatise, 'If All Souls Are One' (IV. 9[8]), provides an opposite perspective in Plotinus' treatment of the problem. It is not the relation of souls to bodies, but rather their relation to one another that

becomes problematic. The first passage, therefore, presents an objection to the thesis that all souls are one precisely on the basis of the unity of experience that sympathy implies.

But, before this, we must discuss whether it is correct to say that all the souls are one soul, like the soul of each individual. For it would be absurd if my soul and anyone else's were one soul: for if I perceived anything another would have to perceive it too, and if I was good he would have to be good, and if I desired anything he would have to desire it, and in general we should have to have the same experiences [*homopathein*] as each other and as the All, so that if I had an experience [*pathontos*] the All would share in the perception of it [*synaisihanesthai*]. (IV.9.1, 13–19: Armstrong translation)

Plotinus is caught here in a dialectical examination of the positions outlined in the three previous treatises. In two of them, IV.7[2] and IV.2[4], he has defined sympathy in terms of soul's unification of the body, and in the other, III.1[3], in terms of the relations of separately ensouled bodies in the universe to one another. In reversing his perspective, he introduces the problem of monism, the exact inverse of the atomism criticized so thoroughly earlier.

The *aporia* now becomes not the relation of soul and body nor the problem of freedom and determinism, but a unity that does away with any individuality at all, the unity, in other words, which was instrumental in solving his former difficulties. He begins in IV.9[8].2 by drawing out the implications of his former position for the present situation. In a reversal of the argument in IV.2.1, he now applies to souls the numerical distinction and separation that qualities had in relation to body. One might suspect inconsistency, but Plotinus is a very careful as well as subtle thinker. In the previous context, the contrast was in the relation of soul and qualities to one body, while here it is the relation of many souls to different bodies. Thus many souls, formally the same, are numerically distinct and separate, just like qualities, in relation to the many bodies they unify.

After establishing the individuality of souls in terms of their relation to individual bodies, Plotinus must reassert unity, lest his own position turn out to be as atomistic as the materialists'. He does so by examining the unity of the cosmos as a whole, the place where these individual souls take up their residency.

For we do not say, either, that it is one in such a way as to be altogether without a share in multiplicity—this must be attributed to a higher

nature—but we say that it is one and a multiplicity, and participates in ‘that nature which is divisible in the sphere of bodies’, and also in the ‘indivisible nature’, so that again it is one. But just as in me the experience of a part need not dominate the whole, but what happens to what is more essential has an influence on the part, in the same way the influences which come from the All to the individual are more obvious, and we are often affected [*homophainton*] in the same way as the whole, but it is not clear whether what comes from us contributes anything to the whole. (IV.9.2, 24–33)

Indeed, the argument deriving from facts opposed [to the assumption of complete separation of souls] asserts that we do share each other’s experiences [*sympathein*] when we suffer with others from seeing their pain and feel happy and relaxed [in their company] and are naturally drawn to love them: for without a sharing of experience there could not be love for this reason. And if spells and magical acts in general draw men together and make them share experiences [*sympatheis*] at a distance, this must be altogether due to the one soul. And a word spoken quietly acts on what is far off, and makes something separated by an enormous distance listen; from this one can learn the unity of all because their soul is one. (IV.9.3, 1–9: Armstrong translation)

Again, IV.2[4].2 provides both the principle and illustrations necessary to resolve the present difficulty. The individuality of souls embodied does not imply complete division. Each soul not only unifies a particular body, but they are all related to the cosmos as a whole. The evidence for this is the sympathy operative between the All and its parts, and among the parts themselves. Plotinus admits that this evidence does not in fact explain how all souls are one, and gives a preliminary explanation in IV.9[8].4 & 5, using the analogy of a science and its parts. His full explanation comes in the middle period of his literary output in VI.4 & 5[22 & 23] and IV.3[27].1–8.

### 1.2 *Soul in Sympathy with Body*

The two treatises in this section consider, respectively, the ascent of the soul by means of the virtues (I.2[19]), and its descent made possible by its omnipresence and immateriality (VI.4[22]). They thus deal with the relation of soul to body from different perspectives, moral and ontological. Looked at morally, the soul has the task of fleeing the body and finding its identity in the Intellect, but, looked at ontologically, the very presence of soul to body needs to be explained. Despite this divergence of purpose, there is considerable connection between the two treatises, which is not

surprising given their chronological proximity, separated only by Porphyry’s arrival in Rome and attendance at Plotinus’ lectures.

There is, for example, a distinction which is essential to both of them, the relation of image to archetype. In I.2, this appears as two types of likeness. One requires a reciprocal similarity between the objects that are alike, while the other precludes such reciprocity. The first type applies to the relation among objects from the same source, with the second, the relation of the objects to that source. Such objects are like the source, but the source is not reciprocally related to them nor even less is it like them (I.2.2, 4–10). An ontological distinction of the same sort dominates VI.4 & 5, as Plotinus tries to define the relation between the sensible and intelligible worlds. In VI.4.9, for example, he differentiates between partition and participation where the one and many are related as transcendent whole to its parts. The parts go out from it as powers, capturing the whole but as images on a lower and more multiple level. In the present context, VI.4.3 provides a similarly complex argument to show the independence of the source and the dependency of the parts.

A closer point of contact, however, is precisely in the use of sympathy, a use repeated only once outside these two treatises in II.3[52].13, 42. It seems to reverse the usual structure of sympathy by describing the soul as in sympathy with the body. In I.2[19], moreover, this particular meaning is seen in a wholly negative light.

What then do we mean when we call these other virtues ‘purifications,’ and how are we made really like by being purified? Since the soul is evil when it is thoroughly mixed with the body and shares its experiences [*homopathes*] and has all the same opinions, it will be good and possess virtue when it no longer has the same opinions but acts alone—this is intelligence and wisdom and does not share the body’s experiences [*homopathes*]—this is self-control—and is not afraid of departing from the body—this is courage—and is ruled by reason and intellect, without opposition—and this is justice. (I.2.3, 10–19: Armstrong translation)

The good and evil states of the soul are distinguished precisely in terms of whether or not the soul is in sympathy with the body, with such sympathy defining its evil state. The summary in I.2.6 makes the same point.

So the higher justice in the soul is its activity towards intellect, its self-control is its inward turning to intellect, its courage is its freedom from affections, according to the likeness of that to which it looks which is free from affections by nature: this freedom from affections in the soul comes

from virtue, to prevent its sharing in the affections [*sympathe*] of its inferior companion. (I.2.6, 23–27: Armstrong translation)

To determine Plotinus' meaning in these two passages, it is necessary to keep in mind the moral tenor of the treatise. He is not discussing the ontological value of the sensible world, but the moral attitude of the embodied soul. The soul, moreover, is not seen as the source of sympathy in the sense world, but as itself in sympathy with the body it is unifying. This is diametrically opposed to the soul's ontological function and nature, wherein the soul's substantial nature is precisely what allows it to give the body sympathetic unity. In the present case, the soul seems to be overly sympathetic, taking upon itself the very limitations that its presence in the body was designed to overcome.

The treatise on the omnipresence of the soul (VI.4[22]) returns to the more familiar ground of the soul's ontological role in the making of the cosmos. There are two instances of sympathy, the first of which reverts to Plotinus' standard usage, and consequently adds no more than confirmation of the particular kind of unity the soul imparts through sympathy.<sup>9</sup> The second instance, on the other hand, occurs in the more general context of the relation of the Intelligible world to the sensible. This dense argument seems intended in fact to justify a positive understanding of the soul's sympathy with the body, the controversial usage of the immediately preceding treatise.

(1) Are we to say the [Intelligible Being] is present itself, or, rather, that it exists independently, but powers go from it to all things and in this way it is said to be everywhere? They mean in this view that souls are like rays, so that it is set fast in itself, but they, as sent forth, become one living thing after another.

(2) Rather, on the one hand, the one over these [many], by not preserving the whole nature which is in that intelligible itself, is present here only as the power of that by which it is present; but this is not to say that that intelligible is not completely present, since even then that intelligible is not cut off from its own power, which it gave to the sensible, but rather the recipient [i.e. the sensible] is able to take only so much of all that is present.

(3) On the other hand, where all the powers are present, being itself is clearly present, though still separate. For if it became form of a particular, it would depart from being the whole and from being in itself everywhere, and would even accidentally belong to the other. But since it wishes to belong to nothing which would wish for it, as far as it is able, being draws near, not

becoming [form] of that particular (but that desires it), nor even less belonging to the other.

(4) It is then not surprising that it is in all of them in this way, because it is in no one of them so as to be dependent on them. In conclusion, to speak in this accidental fashion, that the soul is in sympathy with the body, is equally not absurd, if it were to mean that the soul is itself by itself, not becoming dependent on matter or body, but that it illuminates, as it were, the whole body throughout its whole self. (VI.4.3, 1–22)

In (1), the souls are set up as the means by which the intelligible is present in sensible things. The intelligible, however, retains its own independence, putting into ontological form the statement in I.2.2 that the source is not related to its products. In (2), the soul's power is present here in sensible objects precisely as one. This unity, however, is secondary and deficient. It is in the sensible object as spatially and temporally distinct, with only the power from the intelligible, since it cannot preserve the complete reality of the intelligible. Plotinus thus continues the distinction in IV.7.1 and IV.9 establishing the particular kind of unity the soul gives the living thing, analyzing it in terms of that power which comes from soul's relation to the Intellect.

The exact nature of the relation of soul's power to the Intellect is the major project of this treatise. There is brief indication here that the power must capture the intelligible as a whole, otherwise the intelligible would be cut off from its power. This power must, therefore, present the whole intelligible to the sensible object, with the limitation coming from the side of the sensible as recipient. All of the intelligible is present to it, but it can receive only so much. This relation of whole to part in terms of the notion of power receives more complete analysis later in the treatise at VI.4.9, where the power always brings its source as a whole, but on a lower level that is both different from and an image of the source.

In (3), the argument moves from the powers to being which is present along with them. There is thus a contrast between form and being, form becoming accidentally dependent on the particular, but being drawing near while keeping its independence, since it is the particular that desires it. The scheme in IV.2.1 can perhaps clarify Plotinus' point. Being can be identified with the secondary indivisibility of the intelligible (the soul), and form with the secondary divisibility of qualities in bodies. Soul in this scheme is able to maintain its independence and integral unity, while at the same time it is present to the divided particulars of the sense world."

After this, the conclusion (4) is rather straightforward. With these distinctions in mind, it is not at all absurd to speak accidentally of the soul as in sympathy with the body, since negatively it preserves its independence and positively it illuminates the whole body as a totality." It is clear, however, that speaking of the soul in this way is not strictly accurate. The two treatises, I.2 and VI.4, do not, therefore, advance the analysis of the structure of sympathy, but they do give an interesting insight into Plotinus' explanation of evil. It is not a problem of the soul's ontological function in producing and governing the cosmos, but of a moral attitude that reverses its proper relation to the body, becoming sympathetic to it rather than establishing sympathy within it.

## 2. The Universe and Its Parts

By the time we come to 'On the Problems of the Soul' IV.3 & 5[27 & 29], Plotinus has formulated the basic structure and the major issues concerning the operation of sympathy in his system, but has analyzed in depth only a few of them. The structure of unity establishes the soul as the immaterial source for sympathy in the cosmos. Sympathy, in turn, is the foundation for the kinds of mutual influence and interaction that manifest both the unity and diversity possible in the sensible world. The prologue of the treatise, IV.3.1-8, summarizes this material by making explicit the connection between sympathy and the structure of the Soul, the Hypostasis as transcendent source, with the world soul and individual souls as its participants.

This then is how it is with the solution of this problem, and the fact of sympathy [*sympatheias*] does not hinder our arguments: for since all souls derive from the same from which the soul of the Whole derives too, they have a community of feeling [*sympathês*]. (IV.3.8, 1-3: Armstrong translation)

As Plotinus begins this long investigation, applying his ideas to the experience and functions of the soul, he articulates the connection between his ontological analysis of the structure of the soul and the various states of awareness that characterize its operations. Sympathy is seen here in its cosmic dimension, relating individual souls to the world soul in one community of feeling. Two aspects of this community of feeling receive particular attention, the explanation of the awareness possible for the

embodied soul, and the ultimate unity of the universe as a single living being.

### 2.1 Perception: Between Soul and Object

In discussing the relation of soul to body, three factors are involved, the soul's entrance into, presence in, and departure from the body. The first factor, as we have seen, is more strictly concerned with ontological problems, the relation of whole and part, and the omnipresence and immateriality of the soul. The next two factors add problems of a quite different sort that fall under two general headings: powers of awareness, analyzed in terms of memory, imagination and perception, and affections, whether pleasure and pain, the appetites, or anger. Plotinus defines these states from two points of view, the conditions necessary for their functioning, and the need they serve for the embodied soul.

The full range of these faculties and operations is unique to the human soul alone, with plants and animals not having all of them and the stars and planets, as divine beings, not needing any of them. In articulating the reason why the heavenly bodies do not need various perceptive powers, Plotinus begins with the occasional nature of human perception itself as linked to some specific need in the conjoint of soul and body. In the case of the stars, however, this experiential reason is only incidental, since the essential reason revolves around the perfection and unity of life shared by all the heavenly bodies and manifested in the music of the spheres.

If, of course, the heavenly bodies themselves live a blessed life, and contemplate this life besides with their souls, by this direction of their souls towards one object and by the illumination which extends from them to the whole heaven-like strings on a lyre plucked harmoniously [*sympathos*] they sing a song which is naturally in tune—if this is how the whole heaven and its parts move, the heaven itself being self-directed and the different parts having the same direction in different ways (since their positions are different), then our account will be still more correct, since the life of all the heavenly bodies is still more one and uniform. (IV.4.8, 52-61: Armstrong translation)

The image of the strings of a lyre is common in this part of IV.4, capturing a movement that is at the same time a sympathetic interaction of all the parts together as well as the individual action of each by itself. This combination of perfect unity and individual freedom is pervasive, and is the motivating factor in Plotinus' adoption of sympathy in delineating the

Platonic notion of the cosmos as a single living being. As applied to the stars, it illustrates two points. Sympathy expresses the mutual perfection of the stars, allowing them to contemplate Intellect uninterruptedly, and also points to their materiality, allowing them to wield their mighty influence upon the events of earth.

Plotinus turns next from the music of the spheres to the perception of the mundane. At this point, the particular need for perception is not defined, but rather the elements necessary for the perceptual situation, preserving both the essential impassibility of the soul as well as the essentially passive character of perception itself. The solution is the introduction of the sense organ as between the soul and the sensible object and able to be in sympathy with either one.

There cannot, then, be nothing but these two things, the external object and the soul: since then the soul would not be affected; but there must be a third thing which will be affected, and this is that which will receive the form. This must be jointly subject to like affections [*sympathes kai homoiopathes*] and of one matter with the sense-object, and it must be this which is affected and the other principle [the soul] which knows; and its affection must be of such a kind that it retains something of that which produced it, but is not the same as it, but as it is between the producer of the affection and the soul, it must have an affection which lies between the sensible and the intelligible, a proportional mean somehow linking the extremes to each other, with the capacity both of receiving and of transmitting information, suitable to be assimilated to each of the extremes. (IV.4.23, 19–28: Armstrong translation)

The synthetic character of Plotinus' thought can be seen in this passage. Is Aristotle the source of this description of the role of the organ of sense, the mean between object and knower, potentially the one and a potentiality of the other? Or, Plato, with the affections of the body reminding the soul of the forms within it? Or, the Stoics, with the affections coming together in the leading principle and judged as from the external object? One does not have to choose among them, but it is important to recognize that Plotinus is not merely putting things next to one another eclectically; their mixture is complete and completely his own.<sup>17</sup>

Having used the sympathy between the object and the organ in the explanation of perception, Plotinus turns to the more complex issue of the particular kinds of influence of heavenly bodies, illustrated, for example, by petitionary prayer or the effects of magic.

Their knowledge of prayers is the result of a sort of linking and a particular disposition of things fitted into the whole, and the same applies to their accomplishment of what we pray for; and in the arts of the magicians everything is directed to this linking: this means that magic works by powers which follow on sympathetically [*sympathos*]. (IV.4.26, 1–4: Armstrong translation)

The effectiveness of both phenomena depends on the links and sympathy between parts of the universe. Prayer or magic, as a consequence, puts one in tune with the power of the stars as they form different configurations and patterns. It is, therefore, not a result of some kind of perception, but a communication of or participation in the power of beings in the universe, mediated through the cosmos as material but dependent on the nature of soul as spiritual.<sup>18</sup>

A similar argument holds for the earth itself in its providential care for the life it fosters, an essential element of its descent as soul.

For even if the earth's body is difficult to move, it is certainly not immovable. But the earth's perceptions will not be of small things, but of great ones. But why? Because it is necessary, since there is a soul in it, that it should not be unaware of the greatest movements. And there is nothing to prevent the earth having perceptions for this reason, too, that it may make good arrangements for men, as far as the affairs of men concern it—it will make good arrangements by a kind of sympathy [*sympathos*]<sup>19</sup>—and hearing those who pray to it, and answering their prayers, not in the way we do, and being subject to affection by the other senses in relation to itself. (IV.4.26, 8–17: Armstrong translation)

This last passage reiterates two points characteristic of this section. First, there is the necessary link between the presence of soul and awareness, though such awareness need not be at all like the familiar modes of human awareness. Second, and far more important for our purposes, there is the persistent theme of the unity of the cosmos, expressed through Stoic sympathy, but with its source very clearly in Plato's *Timaeus*, to which Plotinus now turns his attention.

## 2.2 Sympathy: in a Single Living Thing

The next series of passages all come from the same section, IV.4[28].30–45, which Igal describes as investigating the nature and scope of the influence of the stars (III–IV, 302). It is closely parallel to the treatise 'On Destiny' (III.1[3]), with the similar problem of freedom and

determinism, but now arising against the background of the related aporia of atomism and monism (Cf. IV.9[8]). His solution involves a thorough analysis of the phrase from the *Timaeus*, that the universe is a single living being (30d3–31a1).

First of all we must posit that this All is a 'single living being which encompasses all the living beings that are within it'; and it has one soul which extends to all its parts, in so far as each individual thing is a part of it... This one universe is all bound together in shared experience [*sympathes*] and is like one living creature, and that which is far is really near, just as, in one of the individual living things, a nail or horn or finger or one of the other limbs which is not contiguous: the intermediate part leaves a gap in the experience and is not affected, but that which is not near is affected... and since it is a living thing and all belongs to a unity nothing is so distant in space that it is not close enough to the nature of the one living thing to share experience [*to sympathein*]. (IV.4.32, 4–7, 13–17, 20–22: Armstrong translation)

As we have seen, Plotinus applied the primary aspect of his structure of unity to sympathy by showing its source in the Hypostasis Soul (IV.3.8), coming finally in this long section to apply its secondary aspect to sympathy as it occurs among participant souls. Sympathy in this secondary sense, therefore, has two foci: the comprehensive unity of the universe as a whole and, within that, the particular sympathy operative between or within its different parts.

The remainder of this section of the treatise explores the interrelation of these two foci, attempting a delicate balance between the demands of unity, which is the base of the whole structure, and the free and spontaneous movements of its parts, which is needed for their individual integrity.

But since the heavenly bodies move according to reason and their relationships within the [universal] living being vary, and then here below these events occur in our own sphere in sympathy with [*sympathon*] those above, it is reasonable to enquire whether we should assert that these earthly occurrences follow on those above by correspondence, or whether the figures have the powers which bring about what is done, and whether it is simply the figures or the figures made by particular heavenly bodies. (IV.4.34, 9–14: Armstrong translation)

Plotinus, as we have seen in III.1 and IV.9, admits the influence of the stars, but wants to determine the exact nature of this influence: Is it merely

correspondence, an external similarity, or is it causal, the figures actually having the power to bring about what happens? Assuming his earlier argument against determinism, he now argues for both aspects, making more explicit the role of the figures. Is the effect produced by a figure acting as a single entity, or as summing up all the causal factors occurring within it?

In opting for the effectiveness of all the causal factors, he undercuts the determinism of the astrologers by an argument already implicit in their own position, and substitutes an explanation linking both action and signification. A preliminary version of this argument was present in III.1[3].8–10, but Plotinus now illustrates it with the rich and varied images of this section, IV.4[28].30–45, mentioning next the image of the dance."

This argument, then, gives powers to the figures and powers to the bodies arranged: since with dancers each hand has a distinct power and so have the other limbs, but the figures also have great power, and then there is a third group of consequentially effective things, the parts of the limbs which are brought into the dance and their constituents, for instance the clenched fingers of the hand and the muscles and veins which are affected along with them [*sympathounta*]. (VI.4.34, 26–33: Armstrong translation)

In the ensemble of the dance, three elements in the configuration can be the focus of attention: the pattern of the whole dance, the movements of each dancer taken alone, and finally the gestures and movements of specific parts of the dancer's body. The dance as such depends on all three, but each element contributes both as part of the general pattern and as spontaneously moving in its own right, according to the particular sympathy operative within it. This is Plotinus' model for the living unity of the universe, a model that is taken from life itself.

The advantage of this model is that it does not reduce our experience to a formal antinomy of freedom and determinism, but substitutes a mixture of different kinds and levels of causes operating within an overall unitary scheme. It thus has, to use a modern analogy, the flexibility of Einsteinian relativity in contrast to Newtonian objectivity, of a multiplicity of possible perspectives instead of just one. In recapitulating these points, it is the sympathetic unity of the cosmos as one living being that is central for this mixture of unity and plurality.

But if we remember that we posited that the universe is a single living thing, and that since it is so it was absolutely necessary for it to have an internal

self-communication of its experiences [*sympathes*]; and if we remember further that the process of its life must be rational and all in tune [*symphonos*] with itself, and that there is nothing casual in its life but a single melody and order [*harmonia kai taxis*], and that the celestial arrangements are rational, and each individual part moves by numbers, as do the dancing parts of the living being, we must admit that both are the activity of the All, the figures in it and the parts of it which are arranged in figures,...and that this is the way the All lives. (IV.4.35, 8–17: Armstrong translation)

Plotinus begins, as he did in the image of the dance, with the universe as a whole, manifesting itself as a single living thing that is sympathetic to itself. Its life is unified, but not with a deterministic rigidity. In tune with itself, life weaves all else into a single harmony and order, whether the focus is on the whole or moves from part to part. Life fosters life, and thus neither the figures nor their parts are ultimate, but both together produce the flourishing state of the cosmos.

The last two passages in this section mention magic and prayer, both of which were also used to illustrate cosmic sympathy in IV.9[8].3 and IV.4[28].26.

But how do magic spells work? By sympathy [*sympatheia*] and by the fact that there is a natural concord [*symphonian*] of things that are alike and opposition of things that are different, and by the rich variety of the many powers which go to make up the life of the one living creature. For many things are drawn and enchanted without anyone else's magical contrivance: and the true magic is the 'Love' and also the 'Strife' in the All. And this is the primary wizard and enchanter, from observing whom men came to use his philtres and spells on each other. (IV.4.40, 1–9: Armstrong translation)

The factors he lists follow the pattern of his description of the dance, the overview in terms of sympathy, and the interplay of specific parts as alike or different. The third point about the rich variety of powers in the cosmos is, as it were, the central point of his whole investigation. He can now rob magic of its magic by making it like any other power operative in the universe that attracts or repels, merely another illustration of Empedocles' reduction of all things to the interplay of love and strife. Petitionary prayer, too, comes under the same spell of universal sympathy.

But the sun, or another heavenly body, does not hear his prayers. And that which he prays for comes about because one part is in sympathetic [*sympathous*] connection with another, just as in one tense string; for if the string is plucked at the lower end, it has a vibration at the upper. But often,

too, when one string is plucked another has a kind of sense of this by its concord [*symphonian*] and the fact that it is tuned by the same scale [*harmonia*]. But if the vibration can even pass from one lyre to another in so far as a sympathy [*to sympathes*] exists, then there is also one single harmony in the All, even if it is composed of opposites; and it is in fact composed of parts which are alike and all akin, even when they are opposites. (IV.4.41, 1–9: Armstrong translation)

The musical image implicit in the previous passage becomes explicit here with the reemergence of the lyre, in fact, a whole series of lyres. This new twist to the image allows Plotinus to use sympathy not only to illustrate the internal unity of the parts of a thing, but also the relation between separate things that are mutually adjusted.

The discussion of sympathy in IV.4[28] provides, therefore, another example of the clarification Plotinus is able to give to one of his major ideas when he deals with it in a focused and systematic way. At no point does he disagree with the earlier series of treatises, but by drawing together the various themes dealt with in piecemeal fashion and for disparate purposes, he shows more clearly the unity and consistency of his thought. Sympathy, thus, clearly manifests the unity and diversity present between the world soul and individual souls as similarly participants in the Hypostasis Soul and similarly related to the physical universe. As such, IV.4 explores in rather thorough fashion the secondary type of unity in his structural scheme. He begins with individuals and their experience, the sympathy within and between each of them, but this sympathy itself must be traced back to the sympathetic unity of the cosmos as a whole. Without cosmic sympathy, these individual parts would fall into atomistic isolation, a point reinforced in IV.5[29], which examines the necessity of sympathy for sensation.<sup>11</sup>

### 3. The Soul's Causality

No new ground is broken in this final section on sympathy, but only a very late confirmation (II.3[52]) of the anomalous use of sympathy found otherwise only in I.2[19] and IV.4[22].3, and a fascinating study of the role of sympathy in sensation (IV.5[29].1–8). In discussing sensation, Plotinus is dealing with two ostensibly parallel cases, the necessity of the organ as the medium between soul and sensible object, developed at IV.4.23–25, and that of the corresponding medium between the organ itself and the sensible object. In both cases the interests of his Platonism determine the solution, demanding the medium in the first case to preserve

the impassibility of the soul, and not demanding it in the second to accentuate the soul's essential role in grounding sensation in the sympathetic unity of the cosmos. The argument is very tightly drawn, showing Plotinus' ability to focus on a specific issue with all the resources of his system, thereby giving a concise critique of competing systems and the rich subtlety of his own.

### 3.1 Perception: Between Organ and Object

The issue was stated with deliberate precision in the previous paragraph, for it is a common interpretation that Plotinus rules out not only the necessity but even the possibility of the medium in the course of his argument. Evidence of this interpretation abounds: Bréhier's 'Notice' (IV, 57), presents the dichotomy that there either is or is not a medium; G. H. Clark, 'Plotinus' Theory of Sensation,' makes him develop a theory that "appears to be a case of transmission without a medium" (363–365). Armstrong (IV, 30) and Igal (III-IV, 305 & 453ff.) also state in their notes on the text that a medium is not necessary.\* Plotinus' actual position, however, is somewhat more nuanced. It is not so much that the medium is not a necessary condition for sensation, but that it, along with the other necessary conditions discussed in IV.4[28].23–25, is not the sufficient condition. The sufficient condition involves both *synaesthesia* (as the internal intention to look) and sympathy (as the external unity of the physical cosmos). Thus the object between functions at a maximum as a hindrance to sensation or at a minimum as somehow manifesting the sympathetic connection between the sense and its object.

Plotinus begins the discussion with explicit reference back to the comments in IV.4.23–25, where the problem of the medium was first raised.

This is why this knowledge comes through bodily organs; for through these, which are in a way naturally united to or continuous with sense-objects, the soul must somehow in some way come to a unity with the sense-objects themselves, and so a sort of common affection [*homopatheias*] with them must arise. (IV.5[59].1, 10–13: Armstrong translation)

Plotinus takes up the question postponed from IV.4.23, 42,<sup>17</sup> but moves outward from the sense organs to the objects with which they are somehow continuous, examining the other side of the organ's mediation. The distance, posited earlier as necessarily between the organ and the object,

becomes here the problem to be examined, especially in the case of sight or hearing. The distance is assumed to be some kind of body, whether air, water or some other transparent material. Air, for example, is between object and organ, and must at least in the literal sense of the Greek be the medium. The problem is whether or not this medium is affected in the act of sensation, the very distinction Witt makes between air as medium and as instrument ('Plotinus and Posidonius,' 205). The nuance might be captured in English by stating that air, while between the eye and the object, does not act as a go-between.

Following from the premise that the air is the medium, Plotinus quite logically distinguishes between two types of bodies, dense or subtle. Dense bodies block sight and are therefore eliminated from consideration. Subtle bodies, as at least not blocking sight, are then examined to determine whether or not they can in fact be an aid to sight. Plotinus addresses this in two questions which dominate the discussion in IV.5[29].1–4. Does this object between have to be affected first in order for the affection to reach the eye? If, on the other hand, the eye is immediately affected by the object, then is the object between affected differently or not at all?

Plotinus immediately relates this second question to the issue of sympathy, giving the general direction of his answer, but certainly not its final form, a fact which interpreters of this passage have invariably overlooked.

But really the discussion seems to be moving in the direction of the sympathies [*sympatheias*] we talk about. But if one thing is naturally disposed to be sympathetically [*sympathos*] affected by another because it has some kind of likeness to it, then the intermediary [*to metaxu*] between them, being unlike, would not be affected, or would not be affected in the same way. If this is so, then that which is naturally disposed to be affected would be so much more if there was nothing in between [*metaxu*] them, even if the intermediary [*to metaxu*] was of such a kind as to be affected also in some way itself. (IV.5.1, 34–40: Armstrong translation)

Plotinus' use of the plural, sympathies, seems hardly accidental, but a way of indicating the varieties of meaning established so clearly in earlier treatises, especially its immediate context in IV.4[28]. Two of these meanings are particularly relevant, the sympathy operative between or within specific parts of the cosmos and the cosmic sympathy which is their foundation.

The immediate concern is this first kind of sympathy, where the sense organ is 'to suffer sympathetically' with the object on the basis of some likeness to it. Plotinus is establishing, first, that sensation is for him to be understood as knowledge of like by like, maintaining at this juncture that the object between is not, in fact, like either of them. Consequently, it would not be affected at all, or at least not in the same way, and even if it is affected in some way, then the sense organ would be even more directly affected by the object if there were no such object in between. In either case, therefore, the object and the organ can be more directly related if there is, or perhaps could be, nothing between them. The premise of the argument remains, however, that there is in fact something between them, air, for example.

The subsequent review of previous theories concerning the relation of the eye to its object is typically brief (IV.5.2, 1–15), but does nonetheless cover the primary issues related to the discussion of each of his two questions. The first two theories, from Platonic sources, focus on the nature of light, which Plotinus will attempt to define in chapters 6 & 7. The first theory, from *Timaeus* 45b4–d3, joins the light coming from the eye with the intermediate light in the air—following Igal (III-IV, 310 & 455) rather than Armstrong (IV, 285). Plotinus is satisfied with Aristotle's objection that the alteration involved in this theory can just as easily take place in the eye alone without the intermediary (*De Anima* 418a29–b2). The other theory posits light as an efflux, needing an intermediary to keep it going in a straight line, which is again unnecessary since light is incorporeal (Cf. IV.5.6, 17–20).

The following pair of positions are both materialistic, but opposite in operation. The Stoics explain sight in terms of a resistance between the eye and the object, thus making it a material passage of the affection from the object to the eye. The Epicureans, on the other hand, positing images passing through a void, only require space to prevent an obstruction and thus would be quite happy with a theory that eliminates any need for an object between. In an exceedingly rare move, Plotinus admits favoring this Epicurean view, as if in some strange way it shares some common ground with his own position in terms of sympathy, which is the last theory in his list.

The next section, IV.5.2, 15–IV.5.4, 49, presents the thesis of sight by sympathy, and immediately puts it to the test by applying his two questions: whether the object between needs to be affected first (IV.5.2, 21–IV.5.3, 15) or the sensible object affects the eye directly with no role for the object between (IV.5.3, 15–IV.5.4, 49).

(1) But all those who say that seeing takes place by sympathy [*sympatheia*] will assert that one would see less well if there was any intermediary [*ti metaxu*], in that it would obstruct and hinder and weaken the sympathy [*sympatheian*]; but it would be more consistent to say that even that which is akin [*to syggenes*] in all circumstances weakens the sympathy, in so far as it is itself affected. Certainly, if a body continuous to the bottom is set alight by the application of fire, all the same the bottom of it will be less affected by the fire applied to it than the part before it. (IV.5.2, 15–22)

(2) But if the parts of one living being are in sympathy [*sympathe*] will they be less affected because there is something between [*metaxu*] them? Yes, perhaps they might be less affected, but the affection would be in the proportion which nature willed, and the intermediary [*to metaxu*] would prevent excess: unless what is conceded amounts to this, that the intermediary [*to metaxu*] is not affected at all. (IV.5.2, 22–26)

(3) But if sympathy [*sympathes*] depends on being one living thing, and we are affected because we are in one and belong to one, how is continuity not needed when there is perception of something far off? The answer is the continuity and the intermediary [*to metaxu*] are there because the living being must be continuous, but the affection is only incidentally of something continuous, or we shall have to say that everything is affected by everything. (IV.5.2, 26–31: Armstrong translation)

There is both a weak and a strong version of the objection that the medium, or object between, needs to be affected first (1). All would admit, he says, that any object between 'obstructs, hinders, and weakens' the sympathy, but he argues that the more logical position holds that even an intermediary that is totally akin to the organ and its object weakens the sympathy, precisely in being affected itself. He illustrates the point with the example of a continuous physical body set afire, and concludes that a material medium necessarily weakens the sympathy between the organ and its object, even though it establishes physical continuity between them. The primary target is, therefore, the Stoic explanation in terms of a materialistic transfer of the affection from the object to the eye.

Plotinus substitutes instead his own psychic explanation of sympathy, describing first an individual living being and then the cosmos itself as a unitary living being. In the case of an individual living thing (2), its parts are indeed affected less, because there are parts between them. This diversity in affection is precisely the work of nature, with the part between preventing that excess that would be destructive of some other part, or where the affection given is such that the part between is completely

unaffected—again following Igal (III–IV, 457). Perhaps an example of the prevention of excess is the use of the hand to shield eye or ear from excessive light or noise, while the unaffected medium might be involved when reading a book or hearing a discourse conveys information but produces no affection in the body.

In turning to the universal living being (3), more importantly, Plotinus begins to define the nature and scope of sympathy, especially its difference from continuity and the object between establishing it. These two factors relate to the physical aspect of the universe, precluding a void and establishing some minimal physical connection between the distant parts of the universe. It is clear from this that his affinity with the Epicureans is merely incidental, with the only similarity a common immaterial operation, which is utter lack in the case of the void but the presence of soul in the case of sympathy. The physical continuity and the medium, furthermore, are incidentally, but necessarily, related to the affections that constitute sensation, which is precisely the affection of an embodied soul. Plotinus will clarify this complex interrelation when he explores in greater detail the relation of this continuity and medium to the sympathetic unity of the universe as a whole (IV.5.3, 15–21).

The conclusion from the argument so far is that the object between is not needed, and thus those who posit such an object for sight must show the need by some other method (IV.5.2, 34–35). He applies the conclusion himself to the two positions, Stoic and Platonic, that seemed to entail the medium in his cursory list at the beginning of the chapter. Stoic resistance, for example, seems to be explained here (IV.5.2, 35–48) in terms of the theory of reciprocal thrusts (*antiperistaseis*) as it applies to different bodies in the universe: bodies falling, fire rising, trees growing upward, and ourselves moving along. In all these instances, air is parted by bodies without being affected by them, with the corollary that air would need to part even less to allow for the passage of the forms which come to sight. In rare agreement with the Epicureans, Plotinus maintains that such forms do not pass through air as if through a stream, and this corroborates his conclusion that there is no need for the air to be affected first (IV.5.2, 49–50).

He next applies this conclusion to the Platonic thesis (IV.5.2, 50–IV.5.3, 15). Does the air between the object and the eye need to be illuminated? If the answer is yes, then seeing would be like being warmed. It would not be a perception of a distant object (Cf. II.8[35] & IV.6[41]), but of the immediately affected air before the eye, just as the body is warmed by the warm air next to it, and not directly by the more distant

fire. That is, sight would take place by contact. But sight, as Aristotle pointed out (*De anima* 419a12–13), cannot take place by contact. Plotinus gives factual evidence to bolster his case: We see distant objects in daylight, but just as clearly we see, in the darkness of night, fires and beacons, and even distant stars. What is essential is that the object be in the line of sight, confirming once again the conclusion that the intermediary does not need to be affected.

This leads directly to the second question: that sight, in fact, takes place without an object between. Igal sees it clearly as a second objection, needing to be discussed and resolved. It thus cannot be, as it stands, the conclusion of the argument. Plotinus is rarely that simple. His position lies somewhere in between the alternatives posed by the two questions, revealed slowly in their dialectical interplay.

But one might pause to consider this further point, whether it is not possible to see in the absence of an intermediary [*to metaxu*], not because there is no intermediary [*meden metaxu*] but because the sympathy [*sympatheia*] of the living being with itself and of its parts with each other, which depends on being one thing, will be done away with. For it looks as if any kind of perception depends on this, that the living being—this All—is in sympathy [*sympathes*] with itself. For if this were not so, how would one thing share in the power of another, and especially in power from a distance? (IV.5.3, 15–21: Armstrong translation)

Oddly enough this passage, far from eliminating the medium, sees it as a necessary manifestation of sympathy. What, however, can be the connection between sympathy and the medium? What can Plotinus mean?

The solution is readily available if the present context is compared to IV.4.23–25 concerning the necessary conditions for sensation. They may all be there, but without the soul's intention to look, there will be no sensation. The present case focuses similarly on the relation between the necessary and sufficient conditions for sight. The necessary conditions are the physical, and therefore minimal, manifestations of sympathy, precisely the continuity and the medium that his previous argument seems to eliminate, in the view of some interpreters. Consequently, he argues that the absence of these necessary conditions is actually the more radical problem of the absence of sympathy as the sufficient condition. Plotinus' logic is crystal clear, making allowances for the inversion caused by focusing on the external conditions for sight rather than its internal conditions within the sensitive being. Without sympathy, there simply cannot be physical continuity or a medium.

The inevitable conclusion is, paradoxically, that the medium is necessary, but not for the reasons its proponents had given. Plotinus' real difficulty is with a solely materialistic transmission of the affection. This is the point of the first section (IV.5.2, 15–IV.5.3, 15), and the second merely reinforces it (IV.5.3, 15–IV.5.4, 49). He begins again with an allusion to Stoic materialism. If the air in between were affected, it would have to be corporeally, the result of some kind of impression. Such an impression could, however, capture only a partial view of the object. He counters with this argument:

But as it is, the whole object is seen, and all those who are in the air see it, from the front and sideways, from far and near, and from the back, as long as their line of sight is not blocked; so that each part of the air contains the whole seen object, the face for instance; but this is not a bodily affection, but is brought about by the higher necessities of the soul belonging to a single living being in sympathy [*sympathous*] with itself. (IV.5.3, 32–38: Armstrong translation)

There is an uncannily modern ring to this passage. It would be right at home in Twentieth Century phenomenology, for the object is seen as an integral whole. In perceiving it, one is aware at the same time that it can be perceived from any perspective. Such an awareness, Plotinus reasons, is not reducible to a bodily affection, but belongs to the soul precisely as self-sympathetic, that is, as itself a living whole.

The remainder of the treatise, IV.5.4–8, contains a mixture of positions—Platonic, Aristotelian and Stoic—held together by Plotinus' gradual explication of light in terms of his theory of two acts, in which light becomes structurally identical to soul. He begins with a parallel application of the present discussion about the object directly affecting the eye to the Platonic thesis of the mixture of the eye's own light with the light between it and the object, concluding that this intermediate light is needed for seeing at a distance, but remains itself unaffected (IV.5.4, 1–10). The relation of this intermediate light to air is mentioned, but its treatment is briefly postponed to consider an entirely new alternative, that sight is a movement out of the soul to the object, with the object inert and inactive. It comes in two forms, one which seems traceable to Galen (Igal, III–IV, 461 n23) and the other to the Stoics. Galen's version holds the connecting light to be ensouled as the soul moves through it to the object (IV.5.4, 10–38), whereas the Stoics have a materialistic interpretation, with the soul using the light like a stick to reach the object (IV.5.4, 38–46). The

difficulty is the same for both: Seeing is reduced to a species of touch and the receptivity of sensation becomes inexplicable.

In IV.5.5–7, Plotinus finally considers the role of the intermediate air. In the case of hearing, he quickly establishes the same position as for sight: The intermediate air is affected only incidentally, with the colliding bodies a sufficient explanation for the vibrations of sound (IV.5.5). His argument in the case of light is against the Aristotelian position that light is an actuality of a transparent body (IV.5.6, 1–7), or alternatively is a modification of air (IV.5.6, 34–40). He reasons that light depends for its existence, not on air, but on fiery bodies. It is consequently not a quality of air, but an activity coming from such a body—a form of energy in modern parlance. It is therefore a second act, extrinsic to its source and incorporeal, in the same way that life is an activity of soul (IV.5.6, 7–34). As a secondary act, light never perishes, but color, its presence in the corporeal, can disappear, just as the trace of soul in matter can depart, not indicating that light or life perish, but that it is no longer present since nothing is there to pick up its image (IV.5.7, 1–49).

The parallel of light and life only emphasizes the centrality of the soul in Plotinus' account of sensation, expressing in visible form, as it were, the unity of the sense world as derivative of soul. The final passages using sympathy, in IV.5.8, capture this unity of the cosmos in a vivid image that illustrates the necessity of sympathy for any kind of sensory experience.

But if there was a body outside the heavenly sphere and there was an eye looking from our universe with nothing to obstruct its vision, would it see what would not be sympathetically [*sympathes*] connected with our universe, if as things are sympathetic [*sympathes*] connection is due to the nature of a single living being? Now if sympathetic [*sympathes*] connection is due to the fact that perceiving subjects and perceived objects belong to a single living thing, there would be no perception, unless this outside body was part of our [universal] living being: for if it was, there would perhaps be perceptions of it. (IV.5.8, 1–7: Armstrong translation)

As Igal mentions (III–IV, 471 n50), Plotinus is positing a universe numerically distinct from our own, and as such outside the sympathetic unity requisite for sensation. He then gives it all the qualities and characteristics that would make it perceivable, making it seem absurd to claim that our senses fail to perceive their proper objects when they are present. Determining where the absurdity lies is a problem, moreover, that shows the intimate connection of this section on sight to the argument of

the whole treatise, IV.3–5[27–29], that the soul is the principle of both the unity and plurality of the cosmos.

It is that here, being in one and belonging to one, we act and are affected in this way. We must therefore investigate whether this is the reason why we do so. And if this has already been sufficiently shown, our demonstration is complete; if not, we must demonstrate it by other arguments as well. Now it is clear that a living being is sympathetically [*sympathes*] aware of itself; and if the universe is a living being, this is enough; so that the parts also will be sympathetically aware of each other in that they belong to one living being. But suppose someone were to say that this [sympathy] is because of their likeness? (IV.5.8, 14–19: Armstrong translation)

The absurdity comes, not surprisingly, in the conflict between the twin assumptions of Plotinus' theory of sensation. Sympathy precludes any awareness of that other world, but the principle of knowing like by like demands that we know it. The solution can come only by determining which one is prior, and Plotinus does this by tracing all likeness and kinship to the one soul, the source of all, as demonstrated ontologically in IV.3[27].1–5."

### 3.2 *The Influence of the Stars*

The late treatise, 'On Whether the Stars are Causes' (II.3[52]), presents a final consideration of problems going back to his earliest writings, the treatise 'On Destiny' (III.1[3].5 & 6), and examined at great length during his middle period in IV.4[28].30–45 on the nature and scope of the influence of heavenly bodies. In both of these earlier treatises, sympathy plays a role in Plotinus' explanation of stellar influence, an explanation designed to counteract the determinism of the astrologists by situating the causality of the stars within the context of a wider interweaving of causal factors in the single unity of the universe as a whole. The first occurrence of sympathy in the present treatise, despite its textual dislocation," continues the same line of argumentation, refuting the theories of the astrologers, while admitting their evidence (II.3.2–6).

So, too, in the complete whole [of the universe] there is need of some organ like the gall and of some other directed to producing sweetness; others are the eyes of the universe; all are united in feeling [*sympathe*] by their correspondence. So the universe is one and a single melody. (II.3.12, 29–32: Armstrong translation but reading *analogo* [line 31] after E. Orh.)

Igal mentions that this is very much a capsule summary of the positions spelled out more fully in IV.4.28 & 32 (I-II, 395 n76 & n77), indicating that the general nature of sympathy remains consistent throughout Plotinus' writings.

Its second occurrence in this late treatise, however, is more significant, since it reiterates the usage and problem underlying the discussions in two other treatises, I.2[19].3 & 6 and VI.4[22].3. In only these three treatises does Plotinus speak of the soul's sympathy with the body, and only in I.2 and II.3 is sympathy seen negatively. The present context, in addition, emphasizes the dualism in the whole sensible order, affecting human nature and the entire cosmos, even the heavenly bodies. The soul gives rational order to the universe as a whole, but the parts of the universe share in that rationality by degree, as inanimate instruments or living beings with a variety of levels of contribution, from mere locomotion to rational thought. It is through this diversity of activity that Plotinus seeks to explain the origin and status of evil.

So then living things are all conformed to the complete pattern of the All, both the ones in heaven and the rest which have been made parts in the whole, and no part, even if it is a great one, has power to bring about a complete change in the patterns or the things which happen according to the patterns. It can bring about a non-essential alteration in either direction, for better or worse, but it cannot make anything abandon its own proper nature. It makes a thing worse either by giving it bodily infirmity, or by becoming responsible for an incidental badness in the soul which is in sympathy [*sympatheî*] with it and was given out by it into the lower region, or, when the body is badly put together, it may by means of it hinder the activity of the soul which is directed towards it: as when a lyre is not so tuned that it takes the melody [*harmonias*] accurately so as to make its sounds musical. (II.3.13, 34–47: Armstrong translation)

There are links here with the complex theodicy operative in IV.4.30–45, including the simile of the lyre, but that is only the context for the specific contribution of this passage in determining what Plotinus means by evil, especially moral evil.

To begin with, evil falls into the category of the non-essential change that any part of the universe can introduce, proportionate to its size and relation to soul. Such change can be either for better or worse, with change for the worse receiving more detailed analysis. Two examples of this kind of change concern physical evil, coming from bodily weakness or a situation where the body is described as badly put together, and thus

a block to some activity of the soul. In either case, the problem has a more essential relation to the physical capacities of the composite, and does not affect the integrity of the soul.

The significant alternative is where the body is responsible for some accidental weakness, *phaulotetos*, in the soul, because of the soul's sympathy with it. This confirms the point made in I.2.3 & 6 that it is the soul's over-involvement with the body that brings about an evil that in some sense involves a moral dimension. Plotinus adds that the soul is somehow given over to the lower by the body, with reference perhaps to the theory of reincarnation recounted in Plato's *Republic* X. This specifies the weakness as the soul's sinking lower into the sense world, a position congruent with the analysis of evil in Rist, 'Plotinus and Augustine on Evil' (Atti del Convegno internazionale sul tema: *Plotino e il Neoplatonismo in Oriente e in Occidente*, Roma, 1970; Accademia Nazionale dei Lincei, 1974). There is an ambiguity here that Rist expresses well, that "the weakness of the human soul which is moral evil may at times be both an effect of matter and in some way prior" to matter as its cause (502). We find it here in the direct statement that the body is cause of the weakness of the soul, but that it acts as such a cause because of the soul's sympathy with it. A further ambiguity is introduced by describing this weakness of the soul as accidental, assuming strangely, as Rist also notes, that the soul can be affected somehow by the body. It seems that Plotinus tries to protect the impassivity of the soul by making the evil only accidental, but in so doing makes the soul more directly a cause of the evil. Even at the very end of his life, there is no movement beyond this radical ambiguity in his theory of evil and its relation to the soul.

#### 4. Conclusion

In this analysis of sympathy, Plotinus shows remarkable consistency and ingenuity in the application of the basic structure of unity. The treatises of the first period, in fact, give some indication of the particular problems that served to refine Plotinus' thought to the point where the threefold structure of unity emerged with utmost clarity and could then be utilized in the lengthy treatises of the middle period. The first problem is the Platonic dualism articulated in IV.7[2] and IV.2[4]. In trying to delineate the connection between the sensible and Intelligible worlds, Plotinus proposes a fourfold division that contains the structure of unity implicitly in its three highest factors. In IV.9[8], the structure of unity has

its first hesitant debut in the distinction of the Hypostasis Soul and its participants, world soul and individual souls. This treatise also brings into play the countervailing problem of monism, thus forcing Plotinus to steer the narrow course between atomism and monism.

The results of this tension come to expression in VI.4 & 5[22 & 23], a dense reexamination of the relation of sensible and intelligible in terms of the structure of unity. This is now firmly linked with the Platonic doctrine of participation and Aristotle's theory of act and potency, all transformed by his own keen sense of unity as immateriality. With these ontological distinctions in place, Plotinus can turn to an examination of soul in IV.3-5[27-29], its powers and affections. In terms of the discussion of sympathy, the problem of dualism appears in two forms, the relation of the individual soul to sensible objects through the medium of the senses, and the relation of the sense organs to their proper objects where there is a distance between them.

The first area, the soul in relation to the sense world, takes up the bulk of IV.4[28], with the possible interrelations between the parts of the sense world, whether perception, divination or magic, explainable in terms of the unity of the cosmos as a single living thing, combining Stoic sympathy with Plato's *Timaeus*. This emphasizes the two secondary levels in the structure of unity, that sympathy firmly rooted in the world soul as source and principle of the overall unity present in the physical universe, and of the final type of sympathy in the relation of one part of the universe to another. This last and most difficult aspect of sympathy receives thorough examination in IV.5[29] on the problem of sight. Here Plotinus sees the very material continuity of the universe, which functions under certain conditions as the medium between organ and object, as a manifestation of sympathy itself. Sympathy, as a power of the soul, gives the physical cosmos even that physical unity it is capable of having, showing how completely he has transformed this Stoic term.

One other problem occurs in the course of Plotinus' discussion of sympathy, the moral dimension of human life. It appears in III.1[3] as the problem of freedom and determinism, which Plotinus consistently solves by a careful exposition of the full range of causal factors involved in cosmic events and by a careful distinction of the different phases of the human soul. In I.2[19] and II.3[52], however, he addresses the more difficult issue of moral evil and its relation to the soul. His position is clearly subtle, but not enough to eradicate the ambiguity that moral evil presents to a consistently Platonic psychology. The ambiguity can be seen precisely in his use of the term *sympathy*, which ordinarily denotes the

unifying activity of the soul in relation to the material world, allowing the parts of the world to have their own organic unity and, on that basis, to relate to one another. Sympathy in this respect is a decidedly positive phenomenon, manifesting the goodness and unity at the heart of Plotinian reality.

It is therefore all the more striking that sympathy should have some role in Plotinus' attempts to explain the problem of evil. The soul's sympathy with the body, thus, opens the door to moral evil and the soul's entrapment in the sense world. This usage is not only strange because of its association with evil, but this very association seems based on a reversal in the meaning of the term. In no other context does Plotinus claim that the soul, or any higher reality, is in sympathy with a lower. In fact, it is used precisely of the lower in relation to the higher, allowing it to be more unified and thus more in tune with its source. It must be admitted, however, that there is some basis for this usage in Plotinus' theory. He has defined *sympathy* from the very beginning as based in the soul and as expressing its relation to the material world.

The reversal in direction and the association with evil are, nevertheless, problematic, for they introduce an ambiguity in the soul itself. The dilemma is simple. Plotinus has been at pains, especially in controversy with the Gnostics, to show that the material world is not evil, and has thus tended to describe it as the occasion rather than cause of evil. These passages involving sympathy are fully in that tradition. This has the unwanted effect, however, of making the soul itself the implicit cause of evil, or perhaps, more accurately, some kind of co-cause. The ambiguity produced is both unavoidable, given the restrictions of his system, and subtle, given the extraordinarily delicate distinctions Plotinus is trying to make.

## NOTES

1. Reprinted with modification, by permission, from: Gary M. Gurtler, S.J., *Plotinus: The Experience of Unity*, Series 5, volume 43 (New York: Peter Lang Publishing © 1988), 91–137.
2. It is therefore not surprising that of its forty-five occurrences, twenty-seven of them can be found in IV 3–5[27–29], the treatise "On the Problems of the Soul," where the relation of soul to cosmos is examined at considerable length, especially in its last section, IV.4.18–IV.8. Graeser—*Plotinus and the Stoics* (Leiden: E. J. Brill, 1972), 68—emphasizes this connection between sympathy and cosmology in Plotinus.

3. The restriction of sympathy to the physical cosmos is pointed out clearly in my article, "Sympathy in Plotinus," *International Philosophical Quarterly* 24 (1984), 395–406, especially in opposition to K. Keilung, *Über die Sympathie bei Plotin* (Dissertation: Jena, 1916), who misconstrues the two aspects of sympathy: the harmony of the physical cosmos and the various types of perception or influence based on it. Keilung seems to take these latter as establishing a connection between the sensible and intelligible worlds, but in fact they only spell out the cosmic relation between the heavens and the earth.
4. In my article, "Sympathy in Plotinus," there is a preliminary attempt to articulate the connection between consciousness and sympathy, especially in terms of reconciling unity and individuality (403–406), but the intricacy of this connection becomes even clearer in terms of the structure of unity discerned in my book, *Plotinus: The Experience of Unity* (New York: Peter Lang, 1988). That structure presents a combination of vertical and horizontal dimensions that explains how sympathy is rooted in the transcendent world soul and how it is manifest on the same horizontal level in different ways, both for nature in general and human experience in particular.
5. Graeser, *Plotinus and the Stoics*, indicates the blending of Stoic and Platonic elements in the Neoplatonic use of sympathy in three areas (69–72): cosmic sympathy and friendship (*Laws* 903b), the providential governance of the universe (*Phaedrus* 246b and *Timaeus* 30–31), and the influence of the heavens on the earth, more eminently Stoic.
6. Graeser, *Plotinus and the Stoics*, supports the idea that Plotinus is attacking the atomists from a Stoic point of view, but denies the possibility that there is also an implicit attack on the Stoics themselves in terms of soul as source of sympathy (77). It should be noted that sympathy is used to translate two Greek words: *sympatheia* and *homopatheia*, both of which have a similar meaning and function.
7. Both Bréhier, *Plotin "Ennéades"* (Paris: Société d'édition Les Belles Lettres, 1924–1938) IV, 179–188, and Igal, *Plotino: "Enéadas" I–II, III–IV* (Madrid: Editorial Gredos, 1982, 1985) III–IV, 281–283, point out that IV.7 uses the method of the *Phaedo* and the *Phaedrus* in showing the soul to be a transcendent substance, starting from Plato's ontological dualism. Later, in IV.2, Plotinus recapitulates the argument of this treatise and introduces a new method based on *Timaeus* 35a1–4, yielding a four-fold division: the primary divisible and indivisible, and the secondary divisible and indivisible. In the context of this argument against the Epicureans, however, other aspects of the *Timaeus*—the elements and the demiurge—are more clearly the background. P. Friedländer, *Plato: An Introduction* (Princeton University Press, 1969), 246–260, discusses these aspects of the *Timaeus* in relation to modern atomic physics. His comments concerning the parallels between the two in method and in the structures utilized can serve also as background for what Plotinus is attempting, given that there is a similar divergence in

vocabulary and imagery between Plotinus and modern culture that obscures such parallels at the surface level.

8. Igal (III–IV, 282) mentions three factors that should be kept in mind to understand Plotinus' purpose here: (1) it is a division of the four degrees of Being, thus the One and matter are excluded from consideration; (2) the criterion used in this fourfold scale is the degree of quantitative division; and (3) the formula of *Timaeus* 35a1–4, 'the indivisible and divisible,' is taken as the equivalent of *Parmenides* 155e5, 'one and multiple.'
9. It provides a parallel to the discussion of quality and soul in IV.2[4].1, with certain nuances added. The dependency of the qualities on the bodies is more explicit, with no affection existing by itself nor known except in a body. The soul, on the other hand, is numerically one throughout the body and only appears to be divided because the body itself is made up of parts, to all of which the same soul is present. He writes:

Similarly someone would reasonably inquire in this case, how the soul is given magnitude accidentally. For it is obviously not in the way a quality, like sweetness or color, is distributed through the whole body, that the soul is so distributed. These qualities are affections of bodies, so that the whole passive object has the affection and no affection exists by itself, since it is known only as belonging to a body. It follows necessarily from this that it is of such a size, and the white of one part is not sympathetic [*homopathes*] to the white of another. In the case of whiteness, it is the same in species, the white of one part relative to the white of another, but in the case of soul, it is the same in number, whether it is possessed by the foot or the hand, as perceptions make clear. In general, then, it appears that for qualities the same thing can be divided, but that in the case of the soul the same thing cannot be divided, even though it is said to be divided, since it is everywhere. (VI.4.1, 16–18)

10. The meaning of this passage becomes clear if the barely visible parallel structure is recognized. Thus, if being became a form, it would be the form of a particular, *genomenon toude*, and belong accidentally to the other, *kata symbebekos allou*, but being remains separate and thus is neither: *ou genomenonekeinou* and *oud' au allou*. The translation has been thoroughly revised and corresponds to that in my article, "Plotinus and the Platonic Parmenides," *International Philosophical Quarterly* 32 (1992), 441–455.
11. The manuscript tradition is in disagreement whether *symparathēin* (BxUCz) or *sympathein* (w) is present in line 20, but 'keeps pace with' hardly sheds light on this convoluted passage. It either amounts to sympathy or connotes a vague relationship between soul and body that scarcely merits the intricate distinctions Plotinus has been making.

12. The topic of perception, so briefly mentioned in this passage, receives ample investigation in the last part of this treatise on the soul, IV.5[29], to be treated in the next section.
13. J. M. Rist, *Plotinus: The Road to Reality* (Cambridge, 1967), 199–212, presents a discussion of prayer in Plotinus, tracing out sources in Plato and the Stoics, with a distinction between the vulgar petitions of the many and the silent prayer of the purified soul in its ascent to the One featured in V.1[10].6, V.8[31].9, and III.5[50].6. In these passages prayer is directed to Intellector the One, and not to the world soul or the divine souls of the stars and planets. This section is also significant in E. de Keyser, *La signification de l'art dans les Ennéades de Plotin* (Louvain, 1955) in articulating the difference between religious and secular art—the imitation of transcendent forms and not mere sense objects.
14. E. de Keyser, *La signification de l'art*, points out the shift of this image in Plotinus from the more rigid movement of the classical chorus to the mime of the individual dancer, a change reflecting the art of his own day (23).
15. When writing "Sympathy in Plotinus," I saw more congruity in my own position and that of D. Rodier—"The Problem of Ordered Chaos in Whitehead and Plotinus," *The Significance of Neoplatonism*, ed. R. Baine Harris (Norfolk, VA: International Society for Neoplatonic Studies, 1976), 301–317—with his distinction between predictive and operative sympathy. Rodier sees divination as a sign of predictive sympathy, indicating only the external relation between parts of the universe as forming one organic whole, while prayer, magic and, in general, perception are based on an operative sympathy localized to specific parts of the universe and internalized in an agent. In describing their common dynamism, however, their congruence is much more thorough, making it very difficult for him to maintain any real difference between them. It is much easier to see them as diverse manifestations of the same cosmic sympathy, with Plotinus' real aim the grounding of the human soul's independence within the concatenation of cosmic causes.
16. Graeser, *Plotinus and the Stoics*, 77—following G. H. Clark, "Plotinus' Theory of Sensation," *Philosophical Review* 51 (1942), 357–382—is even stronger in his denial of a medium between object and organ, since the organ already functions as medium between object and soul. H. J. Blumenthal, *Plotinus' Psychology* (The Hague: Martinus Nijhoff, 1971), admits in his brief summary of the argument in IV.5 that for some of Plotinus' opponents a medium is necessary (78)—stating only later that the necessity of sympathy for all perception dispenses with a medium (137), with a disparaging remark about R. E. Witt, "Plotinus and Posidonius," *Classical Quarterly* 24 (1930), for suggesting (205) that air is the medium, though not the instrument, of vision. Witt in this instance has hit upon the right solution, but unfortunately his comment was too brief to overcome the tide of opposition.

17. This is discussed in *Plotinus: The Experience of Unity*, Chapter 2, 67–72, and shows the conjunction of the two terms in explaining perception. In IV.4.23, Plotinus argues that the distance between the knower and sensible object and the presence of organs are necessary for sensation to take place. In that context, however, the argument moved internally, from the fact of sensation to the reason why the soul needs such information, either as a necessary consequence of its nature or for the purpose of maintaining its presence in the body (IV.4.24). Neither of these is sufficient for the presence of sensation, and Plotinus moved further back to find its root in the disposition of the soul to look (IV.4.25).
18. Armstrong appends a note to this passage, in which he admits Plotinus' logic in terms of the priority of sympathy as the basis of perception, but notes a logical lapse in another area (IV, 315). He claims that Plotinus' distinction between the Hypostasis Soul and the world soul and individual souls in IV.3[27].1–5 leaves the possibility open that other souls, like the world soul, could produce a distinct universe, still having some sympathetic relation to this one. A more careful examination of IV.3.1–5, as shown in *Plotinus: The Experience of Unity*, indicates, however, that the world soul is not such because it is soul of this world, but rather is world soul because all after the Hypostasis Soul must be united within it (23–30). This consistent structure of unity would not allow for Armstrong's alternative and, conversely, his alternative would have disastrous results, if applied with similarly logical rigor. Thus, could not one also posit additional Hypostases Souls, all equally members of the Intelligible world and equally capable of producing world souls and individual souls? And in a similar way, also in the case of Intellect in relation to the One? The logic of Plotinus' structure seems therefore to be a little more tightly drawn than Armstrong suspects at this point.
19. Thus, 12, 12–32 seems to fit better after 5, 21, with some minor adjustments, as noted by Igal (I–II, 385 & 393: n30, n31, n68, n71).

## **PLOTINUS, NATURE, AND THE SCIENTIFIC SPIRIT**

Michael F. Wagner

...Those on whom  
 Delusion cast its gloomy pall of doubt,  
 Upborn now on the wings that genius lends,  
 May penetrate the mansions of the gods  
 And scale the heights of heaven...  
 Admitted to the banquet of the gods,  
 We contemplate the polities of heaven;  
 And spelling out the secrets of the earth,  
 Discern the changeless order of the world  
 And the aeons of its history.<sup>1</sup>

Science has a privileged status in our culture as discernor and arbiter of human knowledge regarding the natural cosmos. In this regard, modern science is the intellectual progeny of ancient philosophers' attempts to discern the elements (*stoicheia*), principles (*archai*), and causes (*aitiai*) of our cosmos. At the same time, however, ancient philosophers were deeply concerned with issues that today are not normally considered pertinent to science—e.g. with the relationship between human history and conduct, on the one hand, and the inexorable order of natural causality and metaphysical Being, on the other. In their struggles to discern order and law amid the evident diversity and complexity of our cosmos, the ancients grappled also with such issues as contrariety among its sensible appearances, apparent irregularities in its celestial movements, incommensurability and the continuum, the nature of movement and change, and its place within metaphysical reality more generally. Perhaps it is a mark of intellectual progress that scientists no longer burden themselves with most such issues. At the same time, however, the foregoing indicates that piecing together the history of scientific thought often requires recognizing scientific outlooks and concerns amid issues,

even worldviews, which might strike contemporary readers as generally nonscientific.

The diverse doctrines, hypotheses, and methods generated by the fertile minds of ancient philosophers constituted a vital step in humanity's quest for scientific understanding. To some among the ancient philosophers themselves, however, this diversity called into serious question whether intellectual progress was being made or could be made at all. Chief among them were the Pyrrhonian Skeptics, whose critiques of so-called dogmatic philosophy were compiled and elaborated by Sextus Empiricus (fl. c. 200 A.D.). Plotinus, who began teaching in Rome approximately forty years after Sextus' standard flourishing date, has been portrayed as a (perhaps unwitting) collaborator with the Pyrrhonian abandonment of the Greek scientific spirit. Leon Robin, for example, casts Plotinus as chief villain in his exposition of the "Decline of Greek Thought", wherein he alleges that in late antiquity "the natural rationality of the old Greek [scientific] spirit yielded more and more to the invasion of Oriental superstitions." Robin's assessment may be more extreme and pejorative in tone than most scholars'; but the overall image of Plotinus' *Enneads* which it conveys is by no means uncommon—even among Plotinus scholars.

In this essay I shall examine features of Plotinus' Neoplatonism which, far from aiding and abetting Pyrrhonism, seek to save Greek rational or scientific philosophy from its Pyrrhonian attackers. Perhaps most important in this regard is Plotinus' insistence that our cosmos is rational and its rationality is universal, pervasive, and irrevocable; that the *natural* cosmos (the order of Becoming investigated by natural science) is one and the same with the *observable* cosmos (the objects of human sense experience); and that the metaphysical principles which underlie our cosmos and are responsible for its rationality are immune to the Pyrrhonian critique, and so provide an epistemically sound foundation for human investigation of our cosmos. I am not interested here in how particular details of Plotinus' conception of our cosmos might have influenced subsequent thinkers so much as in that conception's place within a philosophical framework which makes rational science epistemically possible. I will, of course, consider specific texts from Plotinus' *Enneads* to piece together a textually viable account of his conception of the natural cosmos and the metaphysical grounds for a scientific understanding of it. But first I shall note some pertinent features of Modern scientific thought, focusing specifically on Galileo Galilei's

views on the relationship between science, observation, and metaphysical principles.

### 1. Science, Observation, and Metaphysics

A chief goal of science is to discern the causes of (all) natural processes and things, the principles (or laws) which order and determine them, and the fundamental substances which underlie or comprise them; and it presumes that, in doing so, it is thereby explaining the same processes and objects which we observe daily by means of our senses. Now, Plotinus identifies the *causes* of nature with its governing or ordering *principles*; and he identifies both of these in turn with the metaphysical grounds for nature's existence—i.e. with its *substance*. The first identification yields his doctrine of *vertical causality*, according to which the cause (or sufficient reason) for a given process or existent is not to be found horizontally—on its same level of Being—but in a higher level of Being to which it stands as an image to its archetype, as an expression of law to the law expressed, as an instantiation of principle to the principle it instances, or the like. The second identification yields Plotinus' doctrine of *hypostasis* (or of *the hypostases*), according to which the metaphysical principles and true (vertical) causes of our cosmos are also ontologically the most fundamental (or real) of all existents; indeed, they comprise the existential ground (substance) of all 'lower' existents, including especially our cosmos. Finally, Plotinus maintains that the natural (or natured) cosmos effected, enunciated, (il)luminated, or temporally instanced by the hypostases just *is* the world of Becoming we observe in sense experience.

Galileo, in contrast, favors material atomism's account of our cosmos' existential ground (substance), and he accepts horizontal causality (i.e. real causal relations among substances within the natural cosmos itself). Despite departing from classical Neoplatonism's identification of nature's causes, its determining principles and its existential ground, Galileo nevertheless insists upon the importance of metaphysical understanding to establishing a scientific conception of our cosmos and even to observing scientifically its sensible manifestations or appearances. To this extent, at least, Galileo echoes basic themes Plotinus develops in his *Enneads* where he argues for the natural-*cum*-sensible cosmos' utter (existential) dependency on metaphysical principles of absolute order (unity), intelligibility (or rational order), and life (or temporalized intelligible order).

Galileo's *Dialogue Concerning The Two Chief World Systems* is a testament to the view that scientific theory and scientific observation depend upon metaphysics to legitimate them. Galileo attempts in his *Dialogue*, first, to undermine Aristotelian support for the Ptolemaic cosmological system and, second, to establish the Copernican system's superiority over the Ptolemaic. His efforts in pursuing this end rest upon, at times even explicitly employ, at least three methodological principles:

- (i) Legitimate science presupposes an understanding of principles which metaphysically inform the natural cosmos and govern its movements and processes.
- (ii) These principles are inherently rational, in themselves and as they inform our cosmos or determine its movements and processes.
- (iii) Observation is pertinent to scientific deliberation just insofar as it also presupposes these principles (is itself rational). The rationality of an observation or method of observation is, in particular, a prerequisite for using it to confirm a scientific theory based on observable appearances or phenomena implied (or 'predicted') by it.

The first two of these principles are especially crucial to Galileo's critique of Aristotelianism, which he summarizes by admonishing Aristotle for "trying to accommodate the architecture to the building instead of modeling the building after the precepts of architecture." The 'building' in this case is our cosmos; and Galileo is insisting that a legitimately scientific conception or model of our cosmos must conform to the 'precepts of architecture.' These precepts, Galileo believes, are mathematical (more precisely, geometric); and so they also are absolutely rational and deductive in their relationships and implications. These precepts are *sine qua non* for any adequate scientific theory. Indeed, the methodological principles stated above, and the Neopythagorean character of Galileo's conception of the metaphysical principles or precepts they mention, are never debated in Galileo's *Dialogue*. They are treated as prerequisites for any legitimate scientific deliberation and debate to occur at all; any scientific model or theory which does not conform to them is necessarily mistaken, and so lies beyond the pale of further rational or scientific discussion.

For Plotinus, the principles informing nature's architecture are his hypostases (the One, Intellect, and Soul). Whether this commits Plotinus to a fundamentally different conception of those principles from Galileo's Neopythagorean conception of them lies beyond the scope of this essay.

More importantly, Galileo is especially concerned in his understanding and use of methodological principles (i) and (ii) that science's conception of our cosmos should not be grounded instead on sensory appearances—most especially, not on pre- or unscientific observations of nature. In this regard, Galileo echoes Plotinus' insistence that metaphysical principles—the preconditions or grounds for natural order—cannot be abstracted from sensory appearances. Plotinus cautions that when attempting to grasp the (metaphysical) nature and order of Being itself, we must not allow ourselves to stray back into the sensible cosmos; we must steadfastly attend to the principles which define and govern that (vertical) order itself (VI.5.2, 19–23). In like fashion, Galileo admonishes Aristotle partly for not attending adequately to metaphysics apart from or prior to his scientific speculations, and especially for the resulting subordination of his conception of our cosmos and the principles informing it to terrestrial appearances.

Galileo focuses on two Aristotelian doctrines in demonstrating Aristotle's error:

- (a) The Earth is the center of celestial motion and the physical referent of all terrestrial motion (i.e. earth and water naturally move towards it, and air and fire naturally move away from it).
- (b) All motions of complex bodies (i.e. bodies composed of more than one of the four elements) are complex motions which result from the natural and simple motions of the elements composing them. (E.g. the motion of a body composed partly of air, whose natural motion is away from the Earth, and partly of earth, whose natural motion is towards the Earth, is determined by which of these two opposed elements predominate in the mixture.)

Doctrine (a) illustrates the dependency of Aristotelian principles upon terrestrial observation, which surely does suggest that the Earth is the center of our cosmos and that moving objects incline towards or away from it. Of course, the Copernican system shares the Ptolemaic belief that a physical body is at the center of our cosmos; whereas the geometric principles of nature do not entail that any physical body must occupy the center of the cosmos. Below I shall say a bit about Galileo's rationale for favoring the Copernican system over the Ptolemaic. For now, the point is that whether there is a physical body at the center of our cosmos (and if so, which one) should not be inferred directly from terrestrial appearances

(and likewise for Aristotle's conception of 'natural' motion); but, Galileo intimates, Aristotle did precisely this.

Nevertheless, doctrine (a) *might* be true, since the desideratum to conform cosmology to geometry does not rule it out. The same cannot be said for doctrine (b), however, thus negating any support that the Ptolemaic system may hope to derive from Aristotelian science. Aristotelian mixed motion is straightforwardly irrational, hence scientifically inadmissible, since it implies that real motions of natural bodies may be (indeed, oftentimes are) resultants from simple motions which are opposed to one another—as in the case of a body composed partly of air and partly of earth; and such an implication, Galileo apparently feels, is as irrational as supposing that a square and a circle can be combined into a real shape of some sort. Moreover, the Aristotelian response, which differentiates our cosmos into two parts and argues that its terrestrial (sublunary) part need not conform to the rational rigors of "mathematical demonstration," thereby further compromises reason and the (geometric) principles of 'architecture' for the sake of Aristotle's metaphysically inadequate conception of the 'building.'

Galileo's insistence that legitimate science *presupposes* rational (and geometric) principles which therefore are not directly or commonsensically inferred from terrestrial (sensory) appearances, however, does not entail for him that observation and sensory appearances are utterly irrelevant to science—and nor that scientific theory is irrelevant to what we do or can observe. Galileo (like Aristotle, and also Plotinus) holds that the cosmos modeled and investigated by science is in fact the same cosmos as the one we experience daily through our senses in our terrestrial context. Moreover, Galileo's ultimate aim is not just to undermine Aristotelian support for the Ptolemaic system but to argue for the Copernican system's superiority over the Ptolemaic; and, considered apart from its Aristotelian affiliations, the Ptolemaic system *per se* is as geometric and rational as the Copernican. Some sort of nondeductive principles of rational choice (e.g. elegance or simplicity) might argue in favor of the Copernican; but Galileo does not develop such an approach. He appeals to observation but, as methodological principle (iii) indicates, not observation *simpliciter*. Precisely where and how observation fits into scientific deliberation for Galileo is itself a matter of ongoing debate among Galileo scholars. In rough and general terms, however, it seems that Galileo distinguishes what might be termed *scientific observation* from nonscientific observation; and, though perhaps not dismissing the latter altogether (i.e. he seems interested in 'saving' as much of appearances as

possible), he seems to maintain that the former is at least more germane to scientific deliberation than the latter.

Perhaps the best known observational evidence offered by Galileo to support Copernicus are his observations of Sun Spots through the telescope. Galileo notes how it

...came about that, continuing to make very careful observations for many, many months, and noting with consummate accuracy the various [Sun] spots at different times of the year, we found the results to accord exactly with the [Copernican system's] predictions.<sup>7</sup>

This suggests that observation pertains to scientific deliberation when it confirms a theory's predictions or implications; but prediction and confirmation seem to be only part of the story. Galileo seems, in particular, to be equally concerned with the rationality of a given observation or appearance. Thus, for example, he commends Aristarchus and Copernicus for remaining "confident of that which *reason* told them must be so" in light of *certain* of their observations, despite also recognizing that their conception of our cosmos conflicted with other observations or appearances: Clearly, not all observations or appearances are equally pertinent to scientific deliberation and, e.g. to theory confirmation. Thus, Galileo seems as intent in the above passage on emphasizing the "very careful observations [and]... consummate accuracy" of his work with Sun Spots as he is on noting its conformity with predictions he derived from his Copernican geometrics. Similarly, he also seems convinced that a heliocentric system (whether Copernicus' or Aristarchus') is simply *more rational* than a terracentric system, and so the explanatory light it sheds even on certain *pretelescopic* observations imbues them with a scientific significance which outweighs potentially falsifying or disconfirming observations. Indeed, Galileo goes so far as to suggest that certain recalcitrant appearances of Mars and Venus are not merely (mathematically) imprecise but in fact are *mistaken* (though he does offer some explanation for why they occur).<sup>8</sup> Observation, or at least *scientific* observation, must somehow share in the rational strictures which Galileo demands *a priori* of scientific theory itself. Although he wishes to account for or 'save' as much of appearances as possible, Galileo seems to hold that since the rationally informed cosmos of scientific theory is the same as the cosmos of sensory observation, the latter confirms, manifests, or the like, the former only insofar as it also is informed by those same rational principles.

Ancient science has been faulted for allegedly lacking an experimental method—for not methodically submitting theory to observational confirmation, or for not amending or refining theory in light of methodical observation. I shall not enter into this controversy here. In Plotinus' case, it surely seems that experimentalism is not an **obvious** feature of his *Enneads*—though it also is the case that the *Enneads* have never been thoroughly investigated for this possibility. It suffices for here, however, that Plotinus' insistence that we must not "stray forgetfully back into the sensible realm" when seeking to understand the metaphysical order of his hypostases does not mean (nor entail) that we must (or even can) ignore the sensible cosmos altogether when we do 'descend' from the metaphysical order into the natural order to discern precisely *how* those principles in fact inform or function in our cosmos. Plotinus insists at length that although our cosmos is not itself a hypostasis, it nevertheless is genuinely and utterly an image of that order. Consequently, a Plotinian conception or model of our cosmos which does not conform it to the metaphysical principles of the hypostases must be incorrect, and *everything* in our cosmos—including *what is observable*—must be explicable in terms of those principles (as a descent from them); and Plotinus' own conception of our cosmos and its processes relies very much on sensory appearances or observed phenomena to discern how or in what way(s) our cosmos conforms to that vertical order. In this regard, of course, we have seen Galileo suggesting that certain appearances may simply be, if not mistaken *tout court*, at least scientifically mistaken, as it were. But even this seems an echo of Plotinus' view that although our cosmos is genuinely and utterly an image of the hypostases, some of its appearances or observable aspects may manifest and reveal its order, rationality, and metaphysical aetiology more perspicuously than others (as we shall see later).

This section has identified several thematic aspects of Galileo's conception of science, observation and their (subordinate) relations to metaphysics. One additional aspect not highlighted thus far is Galileo's insistence that the principles of nature's architecture are, in Plotinian terms, omnipresent. Nature's precepts, Galileo insists, do not hold just for its celestial movements nor just for its simplest, most elemental constituents; they hold equally everywhere throughout our cosmos—for so-called sublunary as well as for celestial bodies, for 'complex' as well as for 'simple' (elemental) bodies, and for every movement of every one of these bodies and/or elemental substances. Plotinus' doctrine that the sensible cosmos is genuinely and utterly an image of the hypostases

likewise implies that its order and rationality is ubiquitous and irrevocable—that our cosmos, *in toto* and throughout all of its parts and processes, is an image of the hypostases. To see how this and preceding themes are developed by Plotinus, and especially to see his own conception of nature, I now turn to several key treatises in his *Enneads*.

## 2. Plotinus' Metaphysics of Nature

Of Plotinus' three hypostases (One, Intellect, and Soul), the second of these (Intellect) is initially the most germane to the issues addressed in section I inasmuch as it is the vertical cause in virtue of which our cosmos is informed with rationality or intelligibility. My primary text for elaborating this point will be *Ennead* III.2, the first installment in Plotinus' two-part treatise on Providence. Among other things, Plotinus argues in this (half)treatise that Intellect is archetypally *cosmos*—the metaphysical prototype for what it is to be a cosmos, or for anything else's being truly a cosmos. He also argues that our cosmos truly *is a cosmos*, and it is a cosmos solely because it is an image of Intellect—i.e. because its relationship to its archetype (Intellect) is grounded in the principles of vertical causality. Plotinus' understanding of Intellect (or *Being*) establishes the 'precepts' to which any sensible, material, or otherwise existing object or system of objects must conform if it is to be investigated or explained rationally (i.e. as a cosmos); and he maintains that our cosmos (or *Becoming*) is irrevocably such an object or system of objects.

Plotinus begins *Ennead* III.2 by contrasting two approaches to understanding the cause or source of our cosmos' substance and structure (*ousian kai systasin*). On the one hand, the materialist (e.g. Epicurean) approach simply rejects the supposition that these have a cause, maintaining instead that they are fortuitous matters of chance (III.2.1, 1–2). The Gnostic approach, on the other hand, postulates a process of divine deliberation and foreknowing which precedes and causes the coming to be of our cosmos (III.2.1, 18). Plotinus' own approach will agree with the Gnostics, *pace* the materialists, that our cosmos is caused and that its cause (his Intellect) is metaphysically *prior* to it. However, Plotinus disagrees with the Gnostics' conception of this priority, especially denying that Intellect is a deliberative agent and our cosmos is an outcome of consciously foreknowing deliberations on its part. Rather, Intellect's priority over our cosmos is to be explicated in terms of its eternally, immutably perfect nature, by virtue of which it simply *is* "the true and first

cosmos" or "the archetypal cosmos" and to which our cosmos is metaphysically related as an image that is "forever coming into existence" (*hypostantos aei*) in conformity with it (III.2.1, 26).

Plotinus maintains, it seems, that materialism requires denying the real existence of *metaphysical* causes, and this leaves materialism without sufficient grounds for understanding putatively systemic or rational features of our cosmos, forcing them to view those features as inexplicable—as matters of mere chance. Given Plotinus' later insistence on the ubiquitous rationality of our cosmos *despite* putative appearances (or certain aspects of appearances) to the contrary, he may also be concerned that if such notions as 'system' and 'rational' are not grounded objectively—in an archetypal or *metaphysical* reality—but are abstractions from whatever it is about our cosmos which happens to strike us that way, then we would have no grounds for investigating the rest of our cosmos (or other features of our cosmos) to discern whether, *despite* (perhaps) appearances to the contrary, they might not also *in fact* be systemic or rational in the same way. At the very least, his insistence on the everlasting ('forever') conformity of our cosmos to its archetype indicates a conscious concern that such abstractions would leave us with no grounds for supposing that the way(s) in which our cosmos is (or seems) systemic and rational now (or insofar as we have noticed this) is at all pertinent to its future (or continuing) condition and processes. In short, the materialist may strive to understand our cosmos and its processes systematically, but he will have no grounds (Plotinus believes) for universalizing that understanding—or at least his grounds will be no more objective than dumb luck or chance.

Plotinus says very little about materialism in the remainder of the treatise. His focus, rather, is on the Gnostic approach and its understanding of our cosmos as a deliberated outcome. Plotinus maintains that our cosmos *doubly* is not a deliberative outcome: first, in that Intellect does not (nor need it) deliberate on what a cosmos must be (or must 'be like') and, second, in that our cosmos' relation to Intellect is not like that between an outcome and a prior process of thinking or deliberating towards that outcome. Insofar as our cosmos is an outcome at all, it is an outcome entailed by, or generated and sustained according to, the *metaphysical* principles in virtue of which metaphysical reality itself is *eternally* and *immutably* ordered (and for Plotinus, of course, also *hierarchically* ordered).

Regarding his thesis that Intellect just is archetypally *cosmos* (and so need not deliberate on this), Plotinus explains that it is the archetypal cosmos because it

...does not stand apart from itself and is not weakened by division and is not incomplete even in its parts, since each part is not cut off from the whole; but the whole life of it and the whole intellect lives and thinks (*noousa*) all together in one, and makes the part the whole and all bound in friendship with itself, since one part is not separated from another and has not become merely other, estranged from the rest; and, therefore, one does not wrong another, even if they are opposites. And since it is everywhere one and complete at every point it stays still and knows no alteration; for it does not make as one thing acting upon another."

This last clause ("for it does not make...") alludes to Intellect's eternal *contemplation* as the metaphysical process whose principles generate and sustain eternally Plotinus' vertical order of true causality, and also to Plotinus' difficult doctrine that Intellect is distinct from our cosmos as (one of) its metaphysical cause(s) but it is not thereby substantively *separate* from our cosmos. More important for now, however, are the features of Intellect which Plotinus believes render it the archetypal cosmos. These features are characterized in this passage in both negative and positive terms, as they bear both upon Intellect as a whole and upon its parts and also upon its parts' relations both to Intellect itself and to one another.

In negative terms, (a) Intellect does not stand apart from itself; (b) Intellect is not weakened by division; (c) Intellect is not incomplete nor subject to change in any way; (d) each of its parts is not cut off from the whole, nor separated from any other part; and (e) one part is not merely 'other,' nor 'estranged' from the rest (of the parts), and nor does it wrong any other part (even when they are 'opposites'). Rather, in positive terms, (a\*) the whole Intellect lives, or is wholly alive; (b\*) Intellect and its life thinks "all [of its parts] together in one"; (c\*) it is everywhere one and complete at every point; (d\*) each of its parts is made the whole of Intellect; and (e\*) all of its parts are bound together in friendship with Intellect. Implicit in this litany of Intellect's archetypal features is a presumption that a cosmos is a whole composed of parts; hence, if Intellect is to be the archetypal cosmos, it also must in some sense be (or be capable of being understood as) a whole composed of parts. The foregoing negative and affirmative characterizations indicate the unique, or at least distinctive, nature of Intellect as a whole, of its parts, and of their relationships. They focus especially on the distinctive nature of (i)

Intellect's life, (ii) its composition, and (iii) its *telos*. In so doing, they sound themes found elsewhere in the *Enneads* where Plotinus is not so intent on understanding Intellect in whole/part terms.

Plotinus maintains in the above passage (i) that the nature of its life is such that Intellect is not distinct from itself and nor are its parts separated or cut off from one another nor from it; rather, its life is *self-contained* (it is identical with Intellect's 'self,' or is a feature of Intellect just *qua* Intellect) and it is *interpenetrating* (it equally is a feature of Intellect as a whole and of each and every one of its parts). Hence, Intellect is not weakened in any way by its division (or, Plotinus may intend, Intellect is not weakened by any *real* division within itself); rather, (ii) its mode of division, composition or containment is by *omnipresence* to itself and to all of its parts as it "thinks all together in [any] one," and so is truly *one* or *unitary* in both its life and its composition. (iii) Intellect thus fully and irrevocably (or *immutably*) realizes its *telos*, as both it and every one of its parts are *perfect(ed)* just by virtue of the nature of its life and unity. Hence, Intellect can never be incomplete, and nor can its parts be in any real opposition with one another or with the whole. Howsoever we are to distinguish Intellect's parts (including even any contraries or 'opposites' among its parts), they are bound both to one another and to Intellect itself in perfect accord, conformity, or 'friendship.' Regarding its life, composition and *telos*, then, insofar as Intellect is (understood as) a whole composed of parts, it is so archetypally inasmuch as

- (i) the whole and every one of its parts are productive or causative ('living') by virtue of the very nature of Intellect and in the manner or sense entailed by that nature (viz. by thought or intellection [*noësis*]);
- (ii) each part is the whole and the whole is each (and every) part, and so also each part is every other part and, indeed, is all of the whole's parts; and
- (iii) the whole and all of its parts are eternally and immutably complete or actual, both in themselves and in all of their (internal) relationships to one another and to the whole.

In Plotinus' Neoplatonism, (i) reflects Intellect's status as a (vertically) causative principle; (ii) reflects its status as a (first) declination from Plotinus' absolutely first principle (the One); and (iii) reflects its metaphysical credentials as an hypostasis.

Our own cosmos departs from Intellect on all three scores. However, Plotinus' initial account in III.2 of the features of our cosmos which

preclude its being the archetypal cosmos touch most fully and explicitly on (ii)—its mode of composition. This seems appropriate since it is Intellect's status as a (first-) declination from the One's absolute simplicity which makes it possible to understand it as a whole composed of parts—hence, as a metaphysical archetype of *cosmos*. Accordingly, contrasting our cosmos with Intellect with respect to (ii) should most sharply define its *nonarchetypal* nature, or why it is that our cosmos is not itself a cosmos archetypally. Plotinus claims, regarding our own cosmos, that

...it is many and divided into a multiplicity, and one part stands away from another and is alien to it, and there is not only friendship but also enmity because of the separation, and in their deficiency one part is of necessity at war with another. For the part is not self-sufficient, but in being preserved is at war with the other by which it is preserved."

Significantly, this passage refers to our cosmos as a whole only initially, asserting—in contrast especially to (b)'s assertion that insofar as Intellect is a whole it cannot be "weakened by [a real] division" into its putative parts—that our cosmos (really) *is many* and (really) *is divided into a multiplicity*. The remainder of this passage deals primarily with this real multiplicity of its parts, contrasting them especially with Intellect's parts in terms of the negative characterizations observed in (d) and (e). Unlike Intellect's, our cosmos' parts *are* separated from (they really do 'stand away' from) one another, and they are not merely 'other' (or different) but each *is* estranged from (it is in fact 'alien' to) the other parts; and whereas each of Intellect's parts is complete and perfect (since each is 'made the whole' by Intellect's omnipresent and interpenetrating life), each of our cosmos' parts is by itself deficient (since each is really separated from and alien to the other parts). Finally, this deficiency in our cosmos' parts is characterized also in terms of each not being self-sufficient but dependent upon other parts for its preservation.

Paradoxically, it might seem that Intellect's parts should depend utterly upon one another (since each is irrevocably related internally to every other one), yet in fact each is by itself eternally complete or actual; likewise, it might seem that our cosmos' parts should not depend upon one another at all (since each is really separate from, and so is related only externally to, the rest), yet in fact each is incapable of preserving itself—indeed, each achieves its *telos*, or is preserved at all, only by virtue of other parts. But whereas the seemingly paradoxical condition of Intellect's parts attests to their immutable perfection and to that of their interrelationships, the paradoxical condition of our cosmos' parts attests to

their metaphysical deficiency—to their temporal, interactive, or warlike character. In sharp contrast with Intellect's archetypal nature, we find regarding our own cosmos that

- (i') productivity or causality (metaphysical life) is not attributed to it at all;
- (ii') Plotinus emphasizes the real multiplicity and separateness of its parts, alluding to their relationship to (and so their composition into) a whole only indirectly—by reference to each part's inherent lack of sufficiency or completion; and so
- (iii') regarding their *telos*, our cosmos' parts are said to relate 'of necessity' to one another in such a way that one depends upon another for its preservation, and it does so in a warlike way (presumably, their real separateness makes any relations they might have violent, e.g. so that one part's preservation occurs at another's expense).

As noted, Plotinus' account in III.2 of how our cosmos departs from Intellect's archetypal nature says very little about our cosmos as a whole. He does not contrast our cosmos, for example, with respect to his earlier assertions that [a] Intellect does not stand apart from itself, and [c] Intellect is not incomplete nor subject to change. Moreover, although that account contrasts our cosmos mainly with respect to negative claims made earlier regarding what is *not* the case for Intellect, it does harken back to (e\*) in saying that "there is not *only* friendship..." and in suggesting that, howsoever it is that the parts of our cosmos are in fact related to the whole (or to one another within the whole), this relationship preserves at least some of them at a given time—*albeit* somehow at the expense of other parts. It thus seems to be a positive characteristic of our cosmos that its parts are bound together in some sense, though not in complete friendship with one another. Whether this precludes their being bound together in (complete) friendship with our cosmos as a whole is unclear; but the enmity caveat regarding any friendship among our cosmos' parts does suggest that at least (b\*) and (c\*) would have to be modified if applied to our cosmos—i.e. the parts of our cosmos cannot be all together *at the same time* and, likewise, oneness or completion cannot be realized throughout every point (or part) of our cosmos *at the same time*. That caveat also seems to deny (d\*) of our cosmos altogether; surely no part of our cosmos could be 'made the whole' cosmos if any given part's very preservation is only at the expense of other parts of that whole.

Perhaps more significantly, there is very good reason for Plotinus' saying so little about our cosmos as a whole in his initial account of its nonarchetypal character. Having stated features of Intellect by virtue of which it *is* the archetypal cosmos and features of our cosmos by virtue of which it is *not* archetypal, Plotinus immediately alludes back to an earlier claim that our cosmos is from Intellect (*para nou*) in such a way that Intellect's providence (*prōnoia*) connotes the metaphysical fact that our cosmos conforms with (*kata*) Intellect as an image conforms to its archetypal cause (see III.2.1, 20–22). Plotinus declares that our cosmos is not an outcome or end result of some divine reasoning (*logismoi*); rather, it exists (1) just by virtue of Intellect possessing the power to produce another without having to *try* to produce it (*aneu...zētein*) (III.2.2, 12–13) and, in particular, (2) just by virtue of Intellect "giving something of itself to matter"—viz. a *logos* whose source is Intellect itself, or its nondeliberative power (III.2.2, 16–19). Our cosmos is forever coming into existence *as a cosmos*, Plotinus argues, by virtue of a *logos* which molds, organizes and controls it on behalf of Intellect and which Intellect produces simply because it is in its nature (causative power) to do so. This *logos* continually produces out of the aforementioned multiplicity, diversity and (putative) enmity of our cosmos' parts a harmony and "singular ordering" of its parts into a whole (III.2.2, 30–31). *Only insofar as we view our cosmos from this perspective can we understand it as a whole and appreciate how it is that our cosmos is indeed a cosmos.*

Plotinus does not elaborate at this point on the notion that Intellect gives a *logos* of itself to matter. We shall see later that this *logos* is Nature, and that Intellect's production of it by a giving of itself is to be explicated in terms of eternal contemplation. Instead, Plotinus now emphasizes two important implications of this notion. First, it allows him to maintain that Intellect remains archetypal or pure (so, metaphysically distinct from our cosmos) without suggesting that Intellect produces and governs our cosmos as an outside, deliberative agent might seek to mold and order it—say, as a terrestrial artist might plan and then work purposively to fashion a work of art." Our cosmos may be construed as a "coming together" of Intellect and Necessity, Plotinus indicates, in the sense that through its *logos* Intellect "descends towards irrationality" (*alogian*) while remaining wholly itself and undefiled, and able to govern and control matter or Necessity (III.2.2, 33–37). Second, this eternal (or at least everlasting) mixing of Intellect with Necessity does not denote an actual mixing of opposed metaphysical elements or principles but connotes the metaphysical fact that our cosmos both is *not archetypally* a

cosmos—i.e. it is an image of Intellect as descending *towards* irrationality, matter, or Necessity—and yet it is still truly *a cosmos*.

Plotinus argues regarding our cosmos that although only Intellect's logos (its presence within our cosmos) is strictly speaking an intelligible thing (*noētos*), this does not imply that our cosmos as such is not truly a cosmos—or, that it is *a-cosmos*. The world of Becoming can be construed as a sort of mixture in the sense that metaphysically it lies between inchoate, irrational matter, Necessity, or Non-Being and rationality, law, or Being itself; but in this mixture Intellect's logos (now referred to as a soul) presides utterly—with complete and sole authority—over the very *substance* of our cosmos, so that Intellect itself may be said to direct our cosmos by a “kind of presence” (*parousia*) (see III.2.2, 36–42). Because of this presiding presence of Intellect in the very substance and fabric of our cosmos, moreover, our cosmos is itself an in-its-own-way likeness or manifestation of Intellect's better (i.e. archetypal) nature (III.2.3, 5–6). More precisely, the world of Becoming is not a concatenation of chance concurrences, nor is it really an irrational realm upon which we (or Intellect) have sought arbitrarily to superimpose an order or structure of some sort; rather, our cosmos is in fact

...a whole, all beautiful and self-sufficient and friends with itself and with its parts, both the more important and the lesser, which are all equally well adapted to it.<sup>14</sup>

When considering our cosmos as a whole, from the perspective of its metaphysical aetiology instead of the diversity and separateness of its parts, Plotinus' highly negative characterization of that separateness and the related enmity among its parts gives way to a highly positive statement of its overarching self-sufficiency, its order (beauty), and its *bona fide* friendship with itself and with each and every one of its parts (and *vice versa*).

To this extent at least, our cosmos, like Intellect, does *not* “stand apart from itself” [a]—although Plotinus is yet to indicate whether our cosmos also is ‘alive’ otherwise than just in having Intellect's logos present in it [a\*]; it is complete [c]—although it cannot be “one and complete” at every point (at least not concurrently), except perhaps insofar as Intellect's logos is ubiquitously one and complete in it [c\*]; its parts are *not* “cut off” from our cosmos as a whole [d], even though they are diverse and separate from one another and so cannot each be made the whole—although here, also, Intellect's logos may be an ubiquitous whole to or in each and every

part which it makes and binds together into a whole [d\*]; and, of course, despite its parts being estranged from one another and wronging one another when our cosmos is viewed part-by-part [e], these same parts in fact are utterly in friendship with the cosmos as a whole—and to some degree, or in some sense, with one another within (or from the perspective of) that whole [e\*]. Our cosmos thus contrasts sharply with Intellect in that it is “weakened by division” [b] and in that howsoever Intellect's logos in fact “binds” its parts into a unity and friendship, this cannot be in a “life [which] thinks all together in one” *simpliciter* or archetypally; but on all other points characteristic of Intellect [(a), and (c)–(d)], our cosmos is unlike but also *like* Intellect.

In line with Plotinus' caution regarding the sense in which our cosmos is a mixture of Intellect and Necessity, those features of our cosmos which demonstrate its nonarchetypal nature (e.g. that it truly is many and divided and its parts are, or appear to be, at war with one another) and those features which render it truly a cosmos nevertheless (e.g. its unity and sufficiency, order and friendship, when viewed as a whole) are indeed distinguishable from one another but they do not denote (really) distinct parts or elements which somehow combine to form one cosmos, or which derive somehow from distinct and opposing metaphysical principles.<sup>15</sup> The warfare we observe among our cosmos' parts, for example, is not something distinct from its (and their) friendship; rather, the putative warfare is in fact *a type of* friendship inasmuch as the objects and warlike processes comprising our cosmos are in fact governed and ordered into a single harmonious whole by Intellect's logos—or, inasmuch as this warfare is in fact Intellect's archetypal friendship adapted to or descended towards multiplicity and matter by way of its logos.

To discern the friendship which is in fact present in—which does truly characterize—our cosmos, we need not look at something other than its many, warring parts; rather, we need only to look more discerningly at “the parts in relation to the whole, to see if they are harmonious and in concord with it; and when one considers the whole one must not look at a few little parts” (III.2.3, 11–13). Plotinus believes that when a person does this, moreover, she will recognize that the parts are indeed harmonious and in concord with the whole. When thus viewed in light of its metaphysical aetiology—or the resulting presence (and operation) of Intellect's logos within it—our cosmos

- (i\*) may as such be still metaphysically dead but at least Intellect's life is present within it in the form of Nature (a logos of Intellect); and so,
- (ii\*) though really separate (from one another) and a multiplicity, its parts are in fact friends with our cosmos as a whole—and even with one another, inasmuch as they do compose a single, harmonious whole by virtue of that presence; and
- (iii\*) our cosmos as a whole and all of its parts, though incomplete when compared with the archetypal perfection of Intellect's *telos*, are fully well adapted to one another and do constitute a fully ordered, utterly unified whole or system—*albeit* one which is continuously evolving or moving and is never finished or completed.

Though still not an archetypal cosmos, our cosmos is thus much more like Intellect than Plotinus' initial part-by-part account, summarized earlier in (i')–(iii'), suggested.

We can reach the same result from considering the fact that Plotinus' Intellect also is the archetype of rationality: Our cosmos truly *is* a cosmos by virtue of the archetypal cosmos (Intellect) informing it with its own rationality through the ubiquitous presence of its logos (Nature). Plotinus' negative [(a)–(e)] and positive [(a\*)–(e\*)] characterizations of Intellect's nature suggest, in other words, Plotinus' conception of rationality. They suggest, for example, that in an archetypally rational system the principles defining its nature (its *metaprinciples*, if you will) define the system without remainder (the system as a whole, including all of its parts, is derivable from them), and they thereby also define each and every one of its parts (the principles interpenetrate the system). Moreover, the nature and contents of such a system cannot change (they are immutable); and nothing is missing or lacking from the system which is necessary for its completion, or which would render it more faithful to or fully derived from its principles. Finally, every part of the system is related to every other part; these relationships are also defined or entailed by the system's principles; and they are unalterable (immutable) and such that every part may be derived from every other part as well as from (or within) the whole.

Since Becoming differs from the archetypal cosmos most evidently in the nature of its parts, we should expect it likewise to depart from archetypal rationality particularly with respect to its parts. Although we may be able to discern *a posteriori* that any given part, process or relationship within our cosmos conforms to its systemic principles, for

example, we cannot deduce each and every one of them from the principles by themselves and certainly not from one another; and although the nature or principles of the system (of our cosmos) as a whole cannot change, its contents (parts) and their relationships to one another certainly do change. Likewise, though perhaps nothing is missing from our cosmos as such, its deficiencies relative to some aspects of an archetypally rational system do render it forever incomplete inasmuch as its faithfulness to or conformity with its principles may continually be tested as hitherto unobserved contents and relationships emerge, or inasmuch as our understanding of precisely how its contents conform to its principles admits continually of reformulation or refinement. Indeed, inasmuch as Becoming's systemic principles do not define (or entail *a priori*) the system, or at least not each and every one of its contents, it is not wholly unreasonable to question whether Becoming is in fact a rational system at all—as opposed, say, to a lucky conglomeration of disparate parts; its rationality is not evident, or at least it is not self-evident or immediately evident, to every rational person.

In the final section of this essay, which addresses Plotinus' response to Pyrrhonian Skepticism, we shall see that Plotinus' notion of archetypal rationality suggests that an archetypally rational system would in effect be (perhaps among other things) a system of necessary truth. This suggests, in turn, that the task he sets for natural philosophers (scientists) is to discern how our cosmos as a whole and all of its parts in fact are governed by, are manifestations of, or are explicable in terms of a system of archetypal (necessary) truth. Plotinus' conception of the *metaprinciples* defining Intellect's nature (and so archetypal rationality and truth), moreover, is based on the five most-high types (the *megista genera*) of Plato: Being, Same, Difference, Motion, and Rest. Before discussing those principles, however, and some details of Plotinus' conception of our cosmos as an image of the archetypal cosmos they define, I return to Plotinus' notion that our cosmos is "forever coming into existence" in conformity with Intellect, relying especially on *Ennead* III.8 for further elaboration.

*Ennead* III.8 is first in a four-treatise sequence that continues with *Enneads* V.8 and V.5, and concludes with *Ennead* II.9. The middle two treatises focus on Intellect, the second of these especially emphasizing that Intellect is a true, archetypal unity. For, although Intellect is a descent from the One—its unity falls short of the One's absolute, unqualified unity—it nevertheless is (as seen in *Ennead* III.2) utterly self-contained, self-sufficient, eternally one ("in friendship") with itself and its parts, and

the like. The final treatise in this sequence is a more sustained attack on Gnosticism. Here, however, I am most interested in the two main conclusions Plotinus draws in *Ennead* III.8. One is that the One is the first principle and source of all Being and life (both archetypal and sensible). The other conclusion is that the entire vertical order (down to its lowest levels) is bound together and proceeds by contemplation, where 'proceeds by' does not connote a temporal or deliberative process but denotes a metaphysical ordering explained by the nature of contemplation—an eternally self-focused act which entails, however, a phantasm or image whose substance is defined by the contemplated object. Together these conclusions guarantee in turn that the *metaprinciples* defining Intellect's nature—its archetypal principles of rationality and of *cosmos*—are themselves grounded in the utterly first principle of all reality (the One) while also informing every level of reality which derives in turn from Intellect. Since our cosmos is itself ineluctably an image or (by-)product of this metaphysically causative order, moreover, its rationality—though not archetypal—is irrevocable, ubiquitous and 'forever' nonetheless.

The argument of *Ennead* III.8 begins with Plotinus postulating or "playing with" the paradox (*paradoxon*) that all activities in the natural cosmos—including the natural processes and movements of plants and the Earth, and also the actions of animate and rational beings—are in fact "serious efforts at contemplation" (III.8.1, 14). He does not tell us why this postulate is (or at least appears to be) a paradox. Perhaps he has in mind the Aristotelian view that contemplation is paradigmatically a *nonproductive* activity.<sup>14</sup> Or he may be foreshadowing a crucial point to emerge later—viz. that since (archetypal) contemplation characterizes the activity of Being, his own metaphysics implies that the activity of *Becoming* is in fact an image of (or an effort to act like) *Being*. In any case, Plotinus begins to resolve or explain this seeming paradox by introducing Nature as "a logos which produces another logos, an offspring of itself which gives something to the substrate while itself remaining unmoved" (III.8.2, 28–30). This response to the paradox will justify invoking contemplation as the archetypal act at which even natural processes and actions are efforts because the power to produce another, or to give something to another, while remaining unmoved (or unmoving) is paradigmatically a characteristic of contemplation (III.8.23, 16–17). I shall discuss how such an act could be the archetype of *Becoming* as I proceed; but first I wish to emphasize a refinement introduced here to the notion of Intellect's logos seen in *Ennead* III.2. In particular, Plotinus here asserts a *double* logos: first, a logos which he identifies with Nature itself

and, second, the logos which is finally given to matter—now identified as an *offspring* of Intellect's logos (Nature).

I begin with Plotinus' further claim that this offspring of Nature is the final logos because it is "dead and unable to produce another" logos; it produces *visible form* or shape instead (III.8.2, 30–34). This additional claim seems meant to distinguish, for example, between the process or activity of a tree growing and the visible or sensible form(s) in which this process manifests itself to human sense experience—say, as we observe the tree altering in size as it grows. Strictly speaking, Nature's offspring would be the tree's *growth*—the tree's growth *process* or *activity* as this transpires in the natural world. The observable alterations in the tree's size is the way in which that natural process manifests itself to our sense experience and is an *image* of the tree's growth, just as the process of growth itself is an image, manifestation, or offspring of the logos Nature. In producing its own visible form—i.e. in manifesting itself to our sense experience—Nature's logos (e.g. the tree's growth-process) is dead since (we shall see later) a true or living logos always produces another living or productive logos as its image; but Nature's logos does not do so. It produces visible form, which is not a *logos* (it is not a metaphysical or intelligible phenomenon, as it were) but a *sensory* or experiential phenomenon. By itself, however, this threatens a vicious regress: If every living logos must produce another living logos, whereas Nature produces a dead logos, then Nature would seem to be a dead logos—and so on, for however far up the vertical order Plotinus' notion of *logos* would extend. To avoid this regress, I note (as we shall see later) that when viewed in its descending mode, once the vertical order proceeds below archetypal life, 'alive' and 'dead' are no longer absolute or all-or-nothing characteristics. Rather, as the vertical order descends from (or beyond) *archetypal* life, its life then becomes increasingly weak and diffuse. In these terms, it may be more accurate to say that Nature's life is so weak—is so far removed from archetypal life—that its offspring is more dead than alive, or has become effectively dead instead of alive.

In claiming that Nature's offspring produces its own visible form, moreover, Plotinus is not alluding to any physical processes (e.g. to any purported physical causes of sensory appearances), but to the vertical (metaphysical) causes of sensible *Becoming's* Being—for example, the intelligibility of the observed alterations in a tree's size in fact *being a process of growth*. Plotinus' model for this sort of (vertically) causal account of sensory appearances is the way in which, as he sees it, a geometer has lines comprising visible shapes directly "fall from" her

activity of geometric contemplation—as opposed to her using physical instruments to draw lines, say, in the dirt (III.8.4, 9–11). Plotinus maintains that this is the true (complete, or sufficient) account of the line-image shapes which manifest themselves to the geometer while she is contemplating and, indeed, that all occurrences of visible (or sensible) forms are to be explained similarly—in terms of the vertical causes of their Being, with Nature being the metaphysical agent of the contemplation which produces sensible form when this is *sensed* rather than imagined by some person. Of course, one point of disanalogy between Nature and Plotinus' contemplative geometer is that what immediately 'falls from' Nature's (attempt at) contemplation is not sensible form as such but real activities, natural processes, or 'Becomings'; and it may be that the ways in which these processes in turn manifest themselves to us as sensible form(s) admit of descriptions which—despite the sufficiency of Nature's contemplative agency—refer also to physical processes or causes of our sensations, or sensory experiences, of them. Nonetheless, the key point to Plotinus' analogy remains, that the true cause(s) which (sufficiently) explain sensible form(s) is not another sensible or observable thing (or things) but is that which defines it as the sensible manifestation of some Being (-in-Becoming)—e.g. of tree-growth, or of triangularity.

Plotinus maintains that the sensible lines—the phantasms of lines—imagined or internally sensed by the geometer are direct products of her (attempts at) contemplating Being (say, triangularity). Analogously, the observed alterations in a tree's visible size are in fact *nothing other than* the tree's growth-process, which surely is a direct result of Nature's (attempt at) contemplating, say, the Being of *tree-ness*. Now, it may be that when explaining why or how it is that we do not (externally) sense just the tree's growth-process as such but certain sensible forms (e.g. sequences of shapes and sizes), we postulate that (external) sensation occurs only when Nature produces other processes (e.g. in our sensory organs) alongside or "in sympathy with" the external tree's growth-process. But while this postulate regarding Nature's *modus operandi* might explain why internally sensed phantasms are manifestations of our own (attempted) contemplations whereas externally sensed phantasms are manifestations of another's (viz. Nature's) contemplations, it is not *necessary*—much less sufficient—even for explaining the sensible form itself. As objects of (external) sense, the observed alterations in the tree's size just *are* the tree's growth-process; they are not in fact real objects distinct or apart from that process, and so they do not require any cause(s) other than the (vertical) cause of that process (in the logos Nature) to explain them—even

though, unlike the geometer case, those (externally) sensible forms remain distinguishable from Nature's direct product in Becoming (the growth-process as such).

Plotinus' approach to sensible form is symptomatic of his views on causality generally. While for many philosophers individual observable things are causes *par excellence*, for Plotinus they are metaphysically ineffective or causatively impotent. The real causal order is not horizontal, or determined e.g. by generalization *from* (repeated) concurrences or sequences of sensible objects. The cause of any thing or process is that which governs, orders, or unifies it. For Plotinus this will be that which defines or gives it substance and Being; and this is a metaphysical or vertical matter, not a physical or horizontal one. As seen from *Ennead* III.2, insofar as the diverse things and processes comprising our cosmos are viewed on their own terms—as a mere multiplicity, or a collection of discrete parts or sensible objects—it seems more a place of fragmentation, warfare, even irrationality, than of rational governance, order and unity. In fact, however, our cosmos is *not* really fragmented, irrational, and the like, because the true causes of its rationality, order, and the like—indeed of its parts themselves—are not to be found amid its observable multiplicity but in the intelligible (*nonsensible*) power of Nature, or only insofar as we can refer sensible objects to intelligible principles which inform Nature's power. *All* things and processes in Becoming are in fact offspring (effects) of that power; and, Plotinus contends, this fact becomes increasingly evident when instead of viewing the diverse parts of our cosmos on their own terms, we consider the sensible cosmos as a single whole and strive to discern how within that whole its parts in fact behave in an harmonious and ordered way, or conform to a system of governance enacted by Nature to inform and order that whole.<sup>17</sup>

Of course, we have seen that in *Ennead* III.8 Plotinus postulates an intermediate logos (or logoi) between Nature and sensible things or forms—viz. Becomings themselves. The world of Becoming has two distinguishable (though not distinct, nor separable) aspects or, as it were, sides: processes of or activities in Becoming as such, which are still images of Being (as expressed, say, in "this temporal process *is* one of *tree-growth*"); and their sensible appearances or forms (e.g. the many diverse sizes observed of the tree as it grows), which strictly speaking are no longer images of Being—though, unlike pure matter, they at least are images of images of Being. The fact that strictly speaking Becomings themselves are the (final) images of Being which result from Nature's

attempts to contemplate Being indicates that Being itself, though static in that its substance is eternal and unchanging, is *dynamic* in that processes, activities, or life (in the terrestrial sense) *are* genuinely and (at the level of our cosmos) appropriately manifestations of it. The (meta)principles defining Intellect's nature establish it as concurrently archetypal Motion and archetypal Rest (its substance or reality *is a motion*—*albeit* one that is eternally at rest) and the existence of Becoming is explained by Nature's inability to contemplate Being in its archetypal condition of (eternal) Rest but only in its aspect of Motion, or only as the principle or archetype of motion." Plotinus thus understands Becoming itself as a sort of Being: The Aristotelian conception of horizontal causality as a web of efficient causes actualizing the potentialities of diverse (sensible) substances gives way to a conception of causality even within our cosmos as a (final) effort at contemplation, or as a (lowest) type of vertical causality. Sensible substance no longer need be capable of the metaphysical feat of jumping from potentiality to actuality; rather, Plotinus considers processes or instances of Becoming to be fully actual and real already—*albeit* owing to Nature's capacity for metaphysical contemplation.

More important, Plotinus' reconception of Becoming discerns intelligibility within the sensible cosmos itself. In our tree example, the differing sensible forms observable through time (its visible size at one moment, succeeded by another visibly taller size at a later moment, and so forth) abstract from what in fact is a single, real, *continuous* process—its *tree-growth* (or *-growingness*, if you will). Accordingly, philosophers of nature should not model our cosmos on its diverse sensible forms and whatever patterns or regularities they may discern among them; rather, to understand our cosmos (indeed, also to explain whatever patterns or regularities they do observe among its sensible forms) natural philosophers should focus on its processes, activities, or instances of Becoming as such—as themselves intelligible realities (*albeit* intelligible realities which we may first notice sensorially, or as sensible realities)—and conceive them to be parts of a single, rational system informed throughout and for all time by immutable principles of Being as these manifest themselves under conditions of Becoming (i.e. space and time).

In terms of the Platonic tradition, this allows Plotinus, on the one hand, to accept Plato's formula that Becoming is the 'moving image of eternity' without invoking a metaphysical principle outside the vertical order of his hypostases to account for how an image of eternity could be moving. On the other hand, Nature's inability to preserve (or contemplate) motion in its archetypal condition of eternal rest allows Plotinus to

maintain a trace of Plato's metaphysical dualism. We have seen Plotinus insist in *Ennead* III.8 that, unlike the archetypal cosmos (Intellect), the vertical causality operative in our cosmos is inherently only an *attempt at* contemplation. As a result of Nature's unceasing effort to attain what Intellect has (or is) eternally, its offspring (our cosmos) departs so significantly from what is above (vertically prior to) it that it may be considered a distinct sort of reality altogether—e.g. a world of Becoming instead of a world of Being. Thus Plotinus speaks at times as if there were, on the one hand, a sensible world and, on the other hand, an intelligible world, even though in fact there is just the single vertical order and its various levels of reality—the sensible world being just its lowest level, a final image or manifestation of its substance and its principles.

In *Ennead* III.8 Plotinus expresses this obeisance to Platonic dualism by alleging that when the vertical order reaches our cosmos of Becoming, it finds itself entering the world of *participation in* Being and exiting the world of Being as such (see III.8.5, 12–13). Various scholars have noted, of course, that Plotinus' notion of participation differs markedly from Plato's notion. In terms of our current discussion, the notion seems meant to indicate that the sensible cosmos, in addition to being metaphysically dead (impotent, or not genuinely causative), is also inherently *partial* and *incomplete* as an image of Being. In *Ennead* II.1, for example, Plotinus refers to body as forever hastening and flowing (II.1.1, 8); and in *Ennead* III.7, he says, concerning celestial motion, that

...it, too, hastens towards what is going to be, and does not want to stand still, as it draws being to itself in doing one thing after another and moving in a circle in a sort of aspiration to substance...[so that it continuously] hastens in this way to everlasting existence by means of what is going to be."

In its attempt to mimic the *telos* of the archetypal cosmos, Becoming behaves as if there were "restless energy" present in it forcing it onwards and "pursuing and destroying countless forms" in its pursuit and hastening (see VI.4.27, 23–25). In contrast, Being as such is eternally whole, complete, self-contained, settled, and quiet. It is not the existence of Becoming or motion as such within our cosmos but the never-settled, forever-restless and -aspiring character of that motion which differentiates it from the archetypal cosmos. Indeed, our cosmos *is* a partial image of (a participant in) Being only because, as noted earlier, (archetypal) motion is itself 'part' of Being—*albeit* along with archetypal Rest. Plotinus thus argues in *Ennead* VI.2 that the Platonic genus of Motion is in fact another

name for Being, whose quietude consists in its being eternally at rest in that archetypal motion (VI.2.7, 8 & 15; also see III.7.3).

I shall not analyze in detail Plotinus' argument in *Ennead* VI.2 for his contention that the five Platonic genera—Being, Same, Difference, Motion, and Rest—in fact *all* denote the same metaphysical cause (Intellect), nor precisely how conceptually distinguishing them as *metaprinciples* of Intellect articulates and explains its (causative) nature. For now, the key point is just that (archetypal) Motion *is* a 'part' of Being, and so our cosmos is a *partial* image of Being just by virtue of its motion or Becomingness.\* It also is significant, however, that when Plotinus portrays motion in our cosmos as sharply different from (or only participatory in) Intellect's Motion-in-Rest, he typically alludes to manifestations of Becoming in *sensible form(s)*—e.g. the circularity of celestial movements and, in general, Becoming's seeming pursuit and destruction of countless (sensible) forms. For, classical Platonism's sharp dualism begins to dissolve as soon as we consider motions or processes as such, apart from or *prior* to their manifestation to us as sequences of sensible form. Thus, a growing tree may seem to be "pursuing and destroying countless forms" (observable sizes); yet, even regarding the observable tree, we can intellectually consider "simply the motion" (as Plotinus puts it in *Ennead* VI.1)—e.g. the tree-growth as such—which, far from being pursued and destroyed by the tree, allows us to make sense of its seemingly countless changes of sensible form while itself just *being* (and continuously *remaining*) an image of some motion-in-Being (e.g. an instance, or moving image, of tree-growth). Similarly, for an example given in the *Enneads* themselves, we can consider a person's activity of walking, as we observe it, as a continual changing of place; but we also can consider it as—from its outset and continuously throughout its existence—simply an instance of *walking* (see VI.1.16, 4–17).

Nonetheless, the fact that motion in our cosmos is *not* Intellect's archetypal Motion-in-Rest entails that even when viewed as intelligible and simple (or unifying) processes of Becoming, motion in our cosmos possesses a sort of aspiring and incompleteness which is not found in Intellect's motion even though it derives from it. For, Plotinus tells us, when considered apart from its eternal condition at Rest in archetypal Being, archetypal Motion itself entails repetition or "once again" (*to palin*) and a striving towards difference and succession (VI.1.16, 5–8). Walking, for example, is a matter of moving in a certain way towards some place different from one's current location. Accordingly, even if walking as such is not really a matter of pursuing and destroying the countless

sensible forms in which it manifests itself to our sense experience (e.g. the numerous observable locations or slices of sensible space a person traverses), it nevertheless is a sort of instance of Being which (at the level of Becoming) can exist only so long as its *telos* (the location toward which one is walking) lies outside it. Paradoxically, as soon as an instance of walking-in-Becoming completes itself (attains its *telos*), it no longer *is* an instance of *walking* (see VI.3.23, 11–12).

Another upshot of Plotinus' conception of Becoming seems to be that even when considered intelligibly, as an image (or images) of (part of) Being, motion in our cosmos must be *in*—or perhaps, it must be generative of—*space and time*; and this is so, once again, because of the nature of motion itself when it is not eternally at-Rest in Intellect. Once again, Plotinus does not conceive of Becoming as resulting from Being compromising with another metaphysically real principle that lies outside of or opposes Being. Becoming's source is wholly vertical inasmuch as Being itself "enters" our cosmos through its logos (Nature), and

...shakes, drives, rouses, and thrusts those that partake in it so that they neither rest nor remain in their own identity in order that they may be caught in that restlessness and turbulence that is only an image of Life [or Motion]. (VI.3.23, 1–5)

Of course, Nature could not "shake, drive, rouse, and thrust" the partial images of Being comprising our cosmos in the manner of an Aristotelian efficient cause—by virtue of itself shaking and thrusting about and somehow imparting, or actualizing a potential for, this among natural things. Plotinus has argued in *Ennead* III.8 that Nature's causality is properly understood as contemplation (or, at least, as an attempt at contemplation) because it "produces another while itself remaining unmoved [and unmoving]"—to which Plotinus immediately adds that Nature thereby produces Becoming itself, but in such a way that it *oversees* it (*epistatōn*) and truly remains a logos of Being instead of itself becoming an activity (*praxis*) in Becoming (III.8.3, 4–5). Since Nature causes Becoming without itself being in Becoming, it must, Plotinus maintains, be a type of soul. More precisely, he argues, Nature must be a soul because the 'living' power in virtue of which it produces its offspring is not just one aspect or part of its Being but comprises its entire essence: "For it, producing is what it is, and its productive power is identical with what it is" (III.8.3, 18). Nature cannot be identical with the hypostasis Soul, however, but must be a lower soul since it is itself an offspring of a prior soul (III.8.4, 15). Plotinus' reasons for these points rest, moreover,

on his use of contemplation as the means by which anything real is grounded in, or is metaphysically caused by, the principles defining his vertical order of the hypostases.

The cause of each level of reality after the One coming into existence as an image of a prior or higher level is contemplation, and is explained by the nature of contemplation. In particular, it is explained by the fact that contemplation is inherently productive because it includes the power to produce an image of its object as a by-product, or offspring, of the very act of contemplating that object. Any deficiency in such an image's Being is not to be explained by any principle or cause outside the act of contemplation itself but by a deficiency in the *clarity* and *completeness* of a given contemplative act. Plotinus argues that the 'dead' nature of Nature's offspring, for example, is due to the fact that Nature's contemplation is "somewhat blurred" and "a weak [or blurred] contemplation produces a weak object," i.e. offspring (III.8.4, 28–30). The blurred and weak character of Nature's contemplation also accounts for Becoming's partiality and incompleteness as an image of Being. The hypostasis Soul, in contrast, is "always filled and illuminated by the higher realm" of Intellect itself—by Being in its eternality and entirety (III.8.5, 10–13). Hence, Nature cannot be the hypostasis Soul (nor *vice versa*); it must be a secondary soul, a descent from the hypostasis soul. To be sure, hypostasis Soul's contemplation is also deficient and weak in relation to Intellect's (archetypal) contemplation; but its weakness is *not* a matter of obscurity, partiality, or blurredness. The weakness of its contemplation is seen, rather, in its need to utter and expound its object in order to learn it (III.8.6, 22–24). Unlike Intellect's offspring, Soul's are more than by-products of its contemplative activity. While the nature of contemplative activity always entails the production of offspring, in Soul's case this production also is the necessary means by which it 'learns' the object of its contemplation. This need to learn its object by expounding it in images gives Soul its essence as making-power; but it also is responsible for Soul's offspring having an obscured, blurred or partial contemplation of Being. In other words, the hypostasis Soul does 'learn' its object utterly and with complete clarity—even if not with Intellect's interpenetrating immediacy, or through the self-identification which characterizes Intellect's contemplative activity; but in Soul's 'learning by expounding' lie the seeds of Becoming and of the obscuring or blurring of archetypal Being that leads ultimately to sensible form.

How does weakness of any sort arise in reality's contemplative activity in the first place? Plotinus argues that "what is produced [by

contemplation] must always be of the same kind (*homogenes*) as its producer but weaker through losing integrity (*exitēdon*) as it descends [from the contemplator, or from its act]" (III.8.5, 23–24). Plotinus' insistence that a product of contemplation will be 'of the same kind' as its producer further buttresses his view that a lower level of reality is not the result of a higher reality somehow compromising with an opposing principle or with some real, independent substrate; rather, a lower reality is a lower, deficient manifestation of the level of reality immediately higher than it." This principle, that a lower level must lose something of its producer's integrity also explains why its own contemplative activity must be weaker than its producer's contemplation. This principle applies already to the hypostasis Soul, inasmuch as Soul is itself the by-product of Intellect's contemplation. Just as Nature is a type of soul since it is a by-product of Soul's contemplative activity, so too must the hypostasis Soul in fact be a kind of Intellect, Plotinus argues, but one which has lost some of its integrity in that it inherently "sees another" (III.8.6, 26). This inherent 'seeing' of its object as 'another' (or, Soul's need to expound its object in order to 'learn' it) differentiates Soul from archetypal Intellect, and once again yields the above result that, for Soul, its making is its essence—i.e. defines it as Soul, even though it also is a kind of Intellect.

Plotinus' notion of an image's loss in integrity relative to its metaphysical producer ultimately denotes a loss in *unity*. This becomes evident when he turns next in *Ennead* III.8 to Intellect as now the archetypal contemplator—just as in *Ennead* III.2 it was the archetypal cosmos. In discussing that treatise, recall, I noted that the One could not itself be the archetypal cosmos because 'cosmos' connotes a *system* of some sort, and so a whole composed of parts. A primary feature of Plotinus' description of Intellect in *Ennead* III.2.1, however, was that Intellect's parts are not separated from one another, nor from Intellect as a whole, but are effectively *one* within the unity of Intellect's thought and with Intellect itself. In other Plotinian terms, Intellect is metaphysically but one remove from Absolute Unity because even the fundamental duality in its nature (between its Motion, Activity, or Life, and the object or *telos* of that Motion) does not denote a real distinction in Intellect. Intellect's Motion and its object are not really distinct from one another—nor from Intellect itself, the ground or 'agent' of this Motion—because Intellect's archetypal Motion is archetypal contemplation, and archetypal contemplation is not a motion directed by an agent towards a distinct object; rather, in archetypal contemplation the contemplator, the act of contemplation, and the contemplated object are in fact one and the same."

In *Ennead* III.8, Plotinus expresses this by describing Intellect as nothing but "living contemplation" (*theōria zōsa*) (III.8.8, 11). It is essentially living since it is a (first) descent from Absolute Unity just by virtue of its Motion, along with the implied (at least logical) difference between motion and its object. It also is essentially contemplative since its Motion is eternally at Rest in Intellect and is eternally the Same as Intellect, and as its object. Likewise, Intellect is also primal (archetypal) Life (III.8.8, 18):

If, then, the truest life is life by thought (*noēsei*) and is the same as the truest thought, then the truest thought lives; and contemplation, and the object of contemplation at this level, is living and life, and the two together are one."

Plotinus thus solidifies Intellect's credentials as the archetypal cosmos by identifying it as a first descent from Absolute Unity or, viewed the other way around, by recognizing that the only metaphysical principle which could be higher than Being (Intellect) is the One.

Plotinus argues in *Ennead* III.8 that in contemplating itself, since it is utterly and truly a unity, Intellect could contemplate only Unity itself as the archetype or source of its substance and essence." Accordingly, Intellect is "first in the order of outgoing" (III.8.9, 34) from the primal substance of all reality; but there must therefore exist a yet higher, absolutely first principle which is the source, power, or cause of the outgoing and of Intellect's archetypal Life within that order (III.8.10, 1-4). Since Intellect's own archetype could only be Absolute Unity—or, since the primal substance of all reality and the (absolutely first) cause even of Intellect are one and the same, viz. Absolute Unity—Plotinus concludes *Ennead* III.8 by insisting that any thing *is* or can *be* just insofar as it is in some way *one* (III.8.11, 19-28). Nothing is intelligible, explicable, alive, or at all real except insofar as it is some sort of Unity (or is a descent from Unity); and, insofar as any thing is causative, it must be a cause or source of unification. The ultimate primacy of unity (and unification) to real substance (and causality) is even more fundamental than the five Platonic *metaprinciples* defining Intellect's nature and than the principles of intelligibility, rationality, or *cosmos* immanent in Intellect. Indeed, these subsequent principles and *metaprinciples* depend upon it (Unity) for their own validity or truth, and so it is also *sine qua non* above all the others for any adequate conception of reality—hence, for any adequate conception of our cosmos, or for any scientific explication of our cosmos and its processes. I now turn to final remarks on Plotinus' own conception of our cosmos and, especially, of Nature.

In his *Phaedo*, Plato posits as the "causes of (things in the world of) generation and corruption" what come to be known as his Forms—suggesting that something in the world of Becoming is beautiful, for example, just insofar as it partakes in Absolute Beauty. In *Timaeus*, however, he adds a "receptacle of random powers" to account for the nature or process of Becoming by which things in our cosmos pursue and partake in form." In contrast, Aristotle posits that things *are* by Nature, which he conceives distributively—as that aspect of his primary substances or hylomorphic individuals which is the "source of being moved and of being at rest in that [substance or individual] to which it properly belongs." In *prima facie* contrast both to Plato and to Aristotle, Plotinus posits Absolute Unity as the utterly first principle of all (real) things, and Living Unity or Primal Life (Intellect) as a derivatively-first principle for things which are not utterly *one* but which are *one* nevertheless."

In effect, however, Plotinus incorporates elements both of Plato's and of Aristotle's views in his metaphysic of Nature. Like Plato, Plotinus maintains that the archetypal cause of our cosmos is eternal Being or Form (though as he conceives of this, of course), and that Being as such must be prior to and devoid of all Becoming. Unlike Plato, however, Becomingness is not explained by a receptacle or some similar principle or substrate, but by Being itself descending to the (metaphysical) level of sensible Becoming. Like Aristotle, Plotinus maintains that the proximate cause of motion and its forms in Becoming is Nature, which is both internal to our cosmos and a logos of Being. Nature—which, unlike Aristotle, Plotinus conceives nondistributively, as a *soul*—has this dual-faceted status by virtue of its being *unifying power* (*dynamis*).<sup>24</sup> As seen earlier, it is the proximate cause of Becoming by virtue of the "once again" character implicit in the nature of its causative activity, owing to the "somewhat obscured and partial" character of its (attempt at) contemplation; yet it thereby also effects Becoming's participation in Being by virtue of the unifying effects of this activity, owing to Plotinus' principle that something *is* just insofar as it is *one* (or is *unified*) in some way.

Partaking in Being by virtue of inner, unifying power seems especially characteristic of life, or of living things; and so we might say that Becoming, as effected by Nature and despite its own causatively impotent (or metaphysically dead) status, is a system of life or of living things. Thus, in *Ennead* I.7 Plotinus maintains that all things in our cosmos—including putatively soulless things (*apsycha*)—partake in Unity,

and so also in Being, because Form (or Being) is an image of the Good (i.e. the One) (I.7.2); and in *Ennead* IV.4 he argues that our cosmos is universally alive (or living throughout)—everything within it living according to its own appropriate (sort of) life—so that even things which may not seem to be self-moving or animate must possess their own “hidden life” as the proximate cause of their motion (see IV.4.36). In *Ennead* VI.9.1 Plotinus argues that even *continuous magnitudes*—the movements of celestial or terrestrial bodies through space—are just in virtue of a unity which those magnitudes possess as effects of some soul or power. Earlier, of course, we saw Plotinus distinguishing between the logos Nature itself, Nature’s logoi, and those logoi’s sensible forms. That the various processes and activities in the world of Becoming, when considered by themselves (prior to their sensible forms), are logoi of a single soul (Nature) is ultimately confirmed by the fact that they *all* are explicable as manifestations of one (metaphysical) thing—viz. unifying power. Nevertheless, that something multiple or composite in Becoming may be unified (and so given Being) from within Becoming itself seems most evident in the case of organically alive things; and so Plotinus’ conception of our cosmos relies heavily on notions associated with (organic) life, including when he has in mind such diverse natural processes as a person’s walking, the celestial movements of heavenly bodies, the burning of a fire, the flowing of a river, or the falling of rocks in an avalanche.

This coalescence in Plotinus’ thought of inanimate and animate processes, and their common dependency on Nature’s unifying power, is the main theme of *Ennead* IV.4. In this treatise, Plotinus sometimes refers to Nature as “the soul of the all,” and sometimes as “the giver of order” (*to kosmoun*) or as a “divine craftsman.” The first title is perhaps most apt insofar as it emphasizes that Nature is not an agent which operates from outside our cosmos but is “the life of our cosmos that possesses leadership within itself.” The latter two sorts of descriptions are also helpful, however, since they emphasize that Nature’s unifying power operates not only in things which we would normally consider to be alive or animate but *wherever* discernible order (*taxis*) exists to demonstrate the presence of unity amid what otherwise may seem just a sensible multiplicity—as, for example, the ordered circularity discernible in a celestial body’s continuous change in its observable position. By discernible order, of course, I do not intend order which necessarily someone has discerned or actually observed. Plotinus maintains that our cosmos is *in fact* rational throughout because—despite its diversity, Becomingness, and its countless

multiplicity of sensible forms—every real thing or process within it in fact *is* ordered in some way. Our cosmos as a whole and *everything* within it is effected and ‘crafted’ by the unifying power of Nature: *all* processes in Becoming are vertical effects (manifestations, logoi) of one master (*hēgemonoun*), because Nature is a soul and “a soul is a unity and its artisanship is [always] one” (see IV.4.10, 1–16). Thus, our cosmos is a vertical effect of a living unity and a logos of Living Unity (IV.4.11, 1).<sup>2</sup>

In my examples of Becoming, I have focused thus far on individual motions, activities or processes within our cosmos. *Ennead* IV.4.10 emphasizes the important fact, however, that Nature’s primary function is to be the soul, or unifying power, of our cosmos as a whole. Indeed, Nature’s presence within individual things or processes derives from that primary function, denoting (part of) the means by which it unifies our cosmos as a single whole. In *Ennead* IV.4 Plotinus proffers a variety of conceptions for how Nature promulgates its primary governorship over the entirety of our cosmos. He tells us, for example, that Nature flows into all things, dominating them and conducting them into a single, circumscribed whole (see IV.4.10, 25 & IV.4.11, 1–4); that diversity springs from a logos, and therefore is always guided in its ‘difference’ and sequentiality by a logos (see IV.4.12, 37ff); that our cosmos is a sympathetic whole because of Nature, and it thereby is itself a living unity (see IV.4.32, 14), wherein all things are established as to their physical conditions, positions, and structures as are the parts of a single living thing (see IV.4.33, 26–33); and that because of Nature all things in our cosmos are entwined into a unity (see IV.4.38, 18). Similarly, Plotinus says elsewhere that the divine logos (Nature) composes what is *one* cosmos from the *many* parts as it orders them into a single whole (I.6.2, 19–20); that the soul of our cosmos “runs over its surface” ordering all things (II.9.7, 29); that our cosmos is a weaving together of all things (III.2.15, 2); that it possesses a soul which binds it together and “brings it entirely under the rule of reason” (see IV.3.9, 43ff & IV.3.10, 11ff); and that the author of all (natural) things is a soul which has breathed life into them all—which has shaped and ordered the heavens and still conducts the heavens in their harmonious movements, and which likewise gives to *all* (natural) things law and motion and life (see V.1.2).

Implicit in the foregoing paraphrases are thus two dimensions to Nature’s operation or function. There is Nature’s distributive ubiquity—the immanence or presence of its unifying power within every thing and process in our cosmos. Soul as such is “power streaming into life” (VI.7.31, 3), and Nature is that power as operative in Becoming in

such a way that every individual (real) thing in our cosmos is a living unity. This dimension to Nature's operation is most evident, I have noted, in those sorts of things which we would normally consider to be living or animate. A plant or an animal is doubly a multiplicity: first, in that it is composed of parts and, second, in that it and its parts move through space and change through time. In both respects, however, such an organism is ordered and patterned into a single whole because both its (organic) parts and its (or their) movements and processes spring from a single active unity within the organism—a productive logos, binding power, or soul (see VI.2.5). Indeed, my earlier discussion of *Ennead* III.8 implied that things in our cosmos are (at least when viewed *sub specie naturalis*) in fact nothing but (ordered patterns of) movements, processes, or Becomings. Insofar as a given process (e.g. a tree's growth) does not exhaust the reality of a thing in Becoming (e.g. the tree), we may distinguish the thing itself (the tree) from that process (its growth). In reality, however, it seems that for Plotinus the reality—indeed, the *substance*—of things in Becoming is comprised of, or is exhausted by, patterns or sets of Becomings which manifest Nature's unifying power in a certain rationally discernible way (or, perhaps, as operative at a certain unificative point within our cosmos). Second, there also is Nature's own *primary* unity as essentially the soul or unifying power of our cosmos as a whole. Thus, we saw in *Ennead* III.2 that it is our cosmos in its entirety, not any individual thing(s) or process(es) within it, that is most clearly and fully an image of the archetypal cosmos.<sup>26</sup> Indeed, Plotinus argued there that it is only in relation to our cosmos as a whole, or to one another as ordered into a single cosmos, that individual processes and their seeming interactions or interdependencies become rationally explicable and 'friendly.' In this dimension to its operation, Nature is a single, undistributed logos or soul—effecting and governing our cosmos as one entirety, wherein individual things and processes are in fact comparable to the diverse parts, or organs and processes, comprising a single living organism.

These two dimensions to Nature's operation are not opposed to one another. Indeed, I have argued that its concurrent presence in diverse individual things and processes, ordering and unifying (or subordering and subunifying) them, derives from its primary status as *the* one (and only) unifying power present in our cosmos. Just as ordering and thereby unifying various parts and processes of a plant or an animal would contribute to its soul's governance of the plant or the animal as a whole, so too does Nature's (sub)ordering and (sub)unification of individual things and processes in Becoming contribute to its operation as the soul of

our cosmos as a (single) whole. Plotinus brings these two dimensions together in *Enneads* II.2.3 and VI.7.7 by arguing that as Nature "runs through" our cosmos effecting, ordering, and governing it, there occurs an "effective separation of [its] powers" wherein its single unifying power manifests itself in various ways in various parts of the cosmos. Thus its distributive ubiquity is in fact (at least part of) the way in which Nature promulgates its primary, undistributed function of ordering and unifying our cosmos as one, single whole.

Plotinus' explication in *Enneads* II.2.3 and VI.7.7 of Nature's distributive ubiquity (as I have termed it) in terms of an "effective separation of powers" implicit (it seems) in its undistributed or primary unificative power might seem to compromise the latter's primacy. Lest Nature as a single soul become something like Aristotle's form of the outermost sphere or a power located (like, on one reading, Anaximander's Indefinite substance) at the cosmogenic center of our cosmos from whence various powers radiate or separate, it might seem necessary that this "separation of powers" denote a distribution or descent of Nature itself, wherein its purportedly singular power in fact becomes many diverse and discreet (sorts of) powers. Nor would it suffice for preserving Nature's primal unity to characterize this counterfactually—e.g. by arguing that even though its power does distribute itself in a certain way, it could have distributed itself differently (indeed, in any number of possible ways which might be consistent with effecting a cosmos). This would not suffice because Nature is a *reality* or an *actuality* for Plotinus. Indeed, Nature is *more real*, or is *higher* in the order of reality, than the world of Becoming and than the various ways in which its power might manifest or separate its self within various parts of our cosmos. The appropriately Plotinian resolution to this conundrum lies, I think, midway between adopting a merely counterfactual account of the primacy of Nature's primal power of unification and denying that Plotinus' separation-of-powers explication of Nature's ubiquitous (self-)distribution denotes a *real* or *actual* (vertical) process. In particular, Plotinus intends, I think, that Nature itself and its primal power *are* in reality already *ubiquitous*—i.e. are present completely (or nondistributively) at every point or within every part of our cosmos.<sup>27</sup> At the same time, Nature's primal unity and power is surely not *absolutely* or *utterly* primal (since the One alone is). Consequently, my notion of Nature's distributive ubiquity and Plotinus' explication of this as a separation of powers denote the fact that at each point or within each part of our cosmos Nature (in fact, or in actuality) *utilizes* its primal power, or

manifests a 'part' of its primal self, in the manner most appropriate to or effective in that part of our cosmos.

The importance of this way of conceiving Nature is perhaps most evident when we recognize that in addition to unifying various parts of our cosmos individually or distributively and to unifying our cosmos as a whole, Plotinus intends Nature also to unify or order observable interactions between or among diverse parts of our cosmos. Indeed, we saw in *Ennead* III.2 that our cosmos' rationality, beauty, or friendship is most evident when we recognize the harmony and rationality which in fact obtains among seemingly warring parts of it. Whether in the case of a fire consuming wood, a lion attacking an antelope, or boulders bouncing off one another during their head-long descent down a mountain—each and every putative interaction among things within our cosmos is in fact a rationally orchestrated, lawfully ordered manifestation of Nature's unifying power. (I'm ignoring, of course, the issue of free will in human behavior.) To suppose that real conflict or warfare exists in such cases would be at least as absurd as supposing that my body is at war with food as it consumes it for nourishment, or that my hands are in conflict with one another when I bring them together in a clapping motion and they bounce off one another after impact. For, while 'consumes' and 'bounces off' may still suggest conflict in some sense, what these terms in fact denote in these examples are lawful sequences of observable events or complex processes of (sensible) Becoming which transpire in a quietly ordered fashion as themselves in reality just parts of the rationally orchestrated cosmic drama being effected in its entirety by Nature. Our cosmos, and the things and processes which comprise it, as further testimony to its nonarchetypal nature, are constrained by principles of contrariety—for example, such that two bodies cannot occupy the same place at the same time, or that the same organic material cannot be both part of an antelope and also part of a lion at the same time. But these principles do not denote any real warfare or actual contraries among various parts of our cosmos. What was once part of an antelope now *becomes* part of a lion, for instance; and this is itself simply a natural process—or, a manifestation of Nature's unifying power as *fully* present throughout our cosmos, including wherever a seeming interaction might occur.

A final point of emphasis regarding Plotinus' conception of Nature: Although Plotinus maintains that Nature is a soul and that souls differ from (sensible) bodies in not possessing size, mass, quantity or position, he does not conceive of Nature and the world of Becoming as two separate substances. Instead, we have seen that as the vertical order descends from

the One and Intellect towards Becoming, each lower level of reality is the same *in substance* as its immediately prior level but weaker or less unified in that substance. The world of Becoming, in particular, just *is* Nature manifesting itself first in Becoming as such and then to our sense experience—therein 'acquiring' size, mass, place, etc. Of course, it then is our cosmos and is no longer Nature as such, inasmuch as 'Nature' denotes the unifying power which is metaphysically prior to and causative of our cosmos. Nevertheless, Nature does not become a separate substance from our cosmos but is "present within it" as that living unity or productive power which in fact is manifesting *itself* at the level of Becoming and sensible form(s). All reality and substance in fact is a descent or outflow from the One, and Nature is prior to our cosmos in the order of that descent or in its reality as a manifestation of that one primal substance; but, for this very reason, it thereby is not itself a (metaphysically primal) substance which somehow constitutes a separate substance from another putative (metaphysically primal) substance which somehow constitutes our cosmos.

This last point is pertinent especially to seeing Plotinus' Neoplatonism and its conception of Nature as a response to Pyrrhonism—my final topic in this essay.

### 3. Plotinus, Pyrrhonism, and 'Scientific Spirit'

Far from supporting the notion that Plotinus' preoccupation with metaphysics implies a disinterest in this-world, or a rejection of its rationality or of the legitimacy and value of scientific investigation of it, the textual discussions in section 2 of this essay have demonstrated a concerted effort in the *Enneads* with saving our cosmos from the irrationality of matter and from intellectually unwarranted conceptions of it. I have, of course, dealt with a very small and select body of texts from Plotinus' *Enneads* and have barely scratched the surface even of those texts. Nevertheless, we have seen a Plotinus who is hardly willing to abandon our cosmos to Gnostic deprecation or to Pyrrhonian indifference. Plotinus' ascent to Intellect in *Ennead* III.2 and to Intellect and the One in *Ennead* III.8, for example, are clearly meant to establish Becoming's pedigree as a *bona fide* image of Being that is all-beautiful, harmonious, etc. Together with *Ennead* IV.4 and other texts I have mentioned, moreover, that ascent also prepares the ground for science itself, among other things, by identifying unifying power as the essence of Nature, by

conceiving of Becoming itself as an intelligible and rational object for human investigation, and by suggesting as guiding concepts for discerning and studying Nature's lawful effects in Becoming such notions as order, harmony, pattern, and the like.

That Plotinus' rational beatification of our cosmos is a response to Gnosticism is, of course, explicit in the *Enneads* themselves. That it also responds to Pyrrhonism is not explicit. Indeed, Plotinus never mentions Pyrrhonism by name, much less individual Pyrrhonists, in the *Enneads*. I shall rely upon Sextus Empiricus' *Outlines of Pyrrhonism* to sketch the main elements of Pyrrhonism's challenge to "Greek rationality" before articulating how Plotinus' Neoplatonism responds to that challenge.

Ancient Skepticism took two principal forms: Academic Skepticism, and Pyrrhonian Skepticism. The former tradition—as enunciated by Cicero, for example—argues that the true natures of things are obscured and hidden from us by sensory appearances and that, as a result, a wise person ought never to assent to anything as *true* but instead should accept and act upon what *seems-true* just in (or from) appearances themselves (what they also term the "probable" or "truth-like"). In this way, Academics hoped to maintain that the goal of the wise person is still truth, or the true natures of things; but this goal is unattainable by any human being. Only truth's likenesses (i.e. appearances) are within our reach; and so, we must be content with the "probability" which lies within our reach, even while striving for our real *telos*—truth itself. Pyrrhonism is a more radical Skepticism whose goal is *quietude*—an utter surcease of the desire to attain truth. A Pyrrhonist will not assent to, nor even just "accept," any theory about the true natures of things whereas an Academic, though he would never "assent to" (commit himself to the truth of) any such theory, may accept a theory if it seems-true at the time or resonates with the probability of sensory appearances."

Both Academics and Pyrrhonists thus live by appearances alone, but they do so for different reasons and in different ways. An Academic lives by appearances because they are truth-likenesses or seemings-of-truth, and he tries to discern in them reason to accept provisionally various of the ideas, beliefs and theories he encounters while vigorously pursuing the forever-elusive truth which lies just beyond his reach—on the other side of appearances. A Pyrrhonist, in contrast, lives by appearances, not because they are (allegedly) truth-likenesses, nor because he believes instead that they themselves must somehow be the truth. He lives by appearances, rather, simply because they are all that lie within our grasp; he has no use for the philosophers' notion of 'truth' at all, and so

disregards it altogether. In Sextus' terms, it is simply the case that appearances are the only things that are "evident" to us. Whether they also are all there is to reality, and so are themselves the truth about it, or whether they are images or likenesses of further reality (and ones which may or may not perspicuously manifest it to us), is of no concern to the Pyrrhonist. Rather, the Pyrrhonist intends to live a solely practical life, thinking and acting in terms of appearances alone and not utilizing or appealing to them in any way whatsoever to speculative ends—unlike the Academic.<sup>4</sup> Sextus' writings, for example, while they do articulate the Pyrrhonian viewpoint, seem more fundamentally meant to lead Pyrrhonists away from pursuing philosophy's traditional end (truth) and towards quietude and perhaps also to serve as a prophylactic for any Pyrrhonist who backslides into searching for truth.

Sextus' *Outlines of Pyrrhonism*, like all of his writings, is long and complex. I shall focus on two of its main features: Its analysis of what Sextus terms *Dogmatic* philosophy, and its attempt (which accounts for its length and complexity) to lead Pyrrhonists towards quietude by establishing an "equipoise" among all Dogmatic beliefs and arguments. For, only after speculation has thusly annihilated or at least paralyzed itself can the Pyrrhonist be free to live his practical life amid the "evident" appearances of sense.

As Sextus sees it, *all* philosophy, not just Pyrrhonism, is *in fact* a search for quietude (*ataraxia*). More precisely, philosophy arises from a recognition of some apparent puzzle or anomaly (*anōmalias*) that disturbs (or disquiets) us, and its goal is to restore quietude by resolving the anomaly." Traditional philosophy, however, has sought to restore quietude by distinguishing between truth and falsehood and supposing that the way to resolve apparent anomalies is to find the truth, and so has come to suppose even that truth is itself the *telos* of philosophy. But an apparent anomaly *is* anomalous in appearances, and so traditional philosophy is forced to suppose that the truth is not to be found in appearances themselves.<sup>5</sup> It thus is forced to go outside appearances—and so, Sextus maintains, outside what is "evident to us"—and to postulate *nonevident* things (*adēla*) which philosophers express in propositions or conceive in thoughts that Sextus terms *intelligibles* (*noēta* or *nooumena*), and which contrast with appearances (*phainomena*). Sextus calls these traditional philosophers *Dogmatists*, and he defines *Dogmatism* as "assenting to a non-evident proposition" or as "assenting to certain of the non-evident things sought by science."<sup>6</sup> As Sextus defines the term, *Dogmatism* does not mean, say, close-mindedness or assenting to something without

argument or reasons. On Sextus' definition, even Academic Skeptics, who insist upon continually examining and reexamining the available evidence and its "probability," are Dogmatists insofar as they search for nonevident things or choose (provisionally) to accept nonevident propositions. Any philosopher who pursues quietude by seeking truth in nonevident propositions or things is a Dogmatist; and, Sextus believes, anyone who seeks the truth *must* do so in nonevident propositions since, as noted, appearances *are* anomalous and so cannot themselves be truth.

Central to Sextus' understanding of Dogmatism is his notion of nonevident propositions, or of propositions which postulate nonevident things. To get some idea of what Sextus has in mind by 'nonevident things,' it is interesting to note that the philosophical tradition least discussed by him is Platonism. Sextus' paradigm of Dogmatic philosophy seems, instead, to be materialism—especially Atomism and Stoicism, and also Aristotelianism. Thus, Sextus offers as prime examples of Dogmatism Anaxagoras' attempt to resolve the anomaly that snow seems to be a form of water which, however, seems unique among forms of water in that it appears to be white by positing "Snow is frozen water; water is black; therefore, snow is black";<sup>1</sup> and Democritus' attempt to resolve the anomaly that honey tastes sweet to some people and bitter to others by postulating that in reality honey is neither sweet nor bitter but instead is composed of (tasteless) atoms and void.<sup>2</sup> In both of these examples, the Dogmatic move is to postulate a real or true material world which underlies appearances and resolves apparent anomalies just by itself not being anomalous. Thus, in Anaxagoras' material hypokeimenon snow shares with all other forms of water that it is really black—it only appears to be white; and in Democritus' material hypokeimenon all things are really tasteless—they only appear to be sweet, bitter, or whatever. Sextus' arguments in his *Outlines* range over all areas of Dogmatic philosophy, not just natural science; and they attack a wide range of Dogmatic philosophers, not just Atomists and Pluralists. Throughout his arguments, however, *material hypokeimena* remain his paradigms of nonevident things; by nonevident propositions or thoughts ('intelligibles') Sextus consistently has in mind propositions or thoughts whose objects lie outside the propositions or thoughts themselves and which—like Anaxagoras' black snow and Democritus' atoms—exist beyond appearances as such. This understanding of intelligibles is also the basis for Sextus' method of equipose.

The bulk of Sextus' *Outlines* is occupied with his strategy of leading Pyrrhonists to quietude by establishing an equipose (*isostheneias*) among

all Dogmatic intelligibles, thereby annihilating or at least paralyzing speculation's desire to reach the truth.<sup>3</sup> Establishing this equipose will not resolve the apparent anomalies which give rise to speculation, of course; but, strictly speaking, Dogmatic philosophy does not resolve them either. The apparent anomalies remain anomalies in appearances for the Dogmatist who 'resolves' them by seeking refuge from them in his nonanomalous (by postulation) realm of nonevident hypokeimena. The Pyrrhonist differs from the Dogmatist on this score, however, precisely because he recognizes that the Dogmatist's 'resolution' of the anomalies of appearances is bogus—that it does not really resolve them at all. More precisely, Sextus' equipose method demonstrates the bogus character of the Dogmatist's response to the riddles of appearances by showing that Dogmatism cannot lead to quietude. His method does this by showing that every Dogmatic intelligible has Dogmatic competitors which contradict it, and that any argument a Dogmatist might give for assenting to his intelligible has competitors which argue against that intelligible and in favor of opposing intelligibles.

The basis for Sextus' method is the fact, as he sees it, that the conflicting intelligibles of the Dogmatists are by themselves all of equal worth since they all are equally nonevident propositions, or thoughts about nonevident things.<sup>4</sup> For this reason, it is incumbent upon the Dogmatist to base his intelligibles upon arguments which seek to prove them and to disprove his competitors' intelligibles. The Dogmatist, Sextus argues, cannot apprehend the objects postulated in his intelligibles just by the act of conception itself (*to noein*); he must implicitly add to the act of conceiving an intelligible an assumption of the existence (*tên hyparchin*) of its postulated object(s).<sup>5</sup> For, as noted earlier, the objects postulated in intelligibles are external to the intelligibles themselves; and thought "does not make contact with external objects and receive presentations by means of itself but by means of the senses, and the senses do not apprehend the external real objects [postulated in intelligibles] but only, if at all, their own affections [*i.e.* appearances]."<sup>6</sup> Since the Dogmatist's postulated objects are not "evident" within the act of conceiving intelligibles itself (nor in sensory appearances), their assumed existence must be made to rest upon arguments which would justify his assenting to them. But the arguments mobilized by Dogmatists in attempting to prove their intelligibles (and to disprove their competitors') can all be shown in turn to be by themselves of equal worth in their logic (validity) and in their relevance (or lack thereof) to appearances (what is "evident"), and so they also stand in need of their own proof—and so on, and so on, *ad infinitum*.<sup>7</sup>

Not only can traditional philosophy never lead us to the truth (or, at least, never to recognition of the truth), and so return us to a condition of quietude; it cannot even demonstrate that one intelligible is stronger than another. All of the Dogmatist intelligibles are equally provable, and equally refutable.

The Pyrrhonian attack on the Greek scientific spirit has speculative quietude or scientific indifference as its goal, and its focus is the Dogmatic character (the Pyrrhonists believe) of all traditional Greek philosophy. In light of this, it is crucial to recognize that, although Plotinus' Neoplatonism seeks to resolve the apparent puzzles and anomalies of sensible Becoming by finding reality or truth, it is *not a form of Dogmatism*. For one thing, Plotinus' philosophy denies the presumption that apparent anomalies in fact *are* anomalies in appearances, and so also the Dogmatist's approach to 'resolving' them by postulating a realm of hypokeimena beyond all appearances wherein lies the truth. In thus rejecting the Dogmatic program of finding truth in such hypokeimena, moreover, Plotinus also rejects the nonevident intelligibles of the Dogmatists. Truth is to be found in, or by means of, intelligibles for Plotinus; but the so-called 'intelligibles' of the Dogmatists are not genuine intelligibles to begin with.

Plotinus maintains, we have seen, that our cosmos as a whole and every part of it is ordered and unified by Nature, and our cosmos is not separate in substance from Nature but it and its parts are in fact manifestations of Nature itself. The world of Becoming is, as a result, thoroughly rational; and this is in fact the very same world as that which appears to us in sense experience, or which we also discern in sensible form(s). Plotinus' Nature, in other words, is not a hypokeimenon, or 'underlie,' for appearances at all.<sup>6</sup> Sensible form (or appearances) is just a final manifestation of the one real substance which extends or proceeds from the One all the way to the level of sense experience. To be sure, the consequent rationality of sensible Becoming is not always *self-evident* in the "evident" world of sensory appearances. At times, it may become evident only after much careful study and scientific investigation informed by an understanding of how the principles of rationality or *cosmos* operate and manifest themselves to us, ultimately in sensible form(s). Apparent anomalies are thus not really anomalies in appearances, but are appearances whose (nonanomalous) rationality might not be readily discernible insofar as it is not self-evident in appearances. But to say that the sensible cosmos' thorough rationality is not self-evident is not to say that it must therefore be *nonevident*, or that it therefore can be a feature only of a realm of hypokeimena which lies outside all appearances.

Recalling the anomalies of snow's whiteness and of honey's taste, for example, the Plotinian idea would seem to be that these are not to be 'resolved' by postulating an underlying matter in which snow is not white and honey is not really sweet nor bitter; instead, they are genuinely to be resolved by understanding the various ways in which Nature appropriately and rationally manifests itself, or operates, in the diverse parts and amid the complex circumstances or conditions found in our cosmos. For example, whiteness is the appropriate visible form for water to take under certain conditions, and sweetness (or bitterness) is the appropriate flavor for honey in certain circumstances (which include conditions in the person tasting it). As St. Augustine tells the Academic Skeptic in his *Contra Academicos*, regarding whether we can apprehend "evident truth" in appearances: "Perhaps it cannot be apprehended by you or other fools, but why can it not be apprehended by a wise person?" (Book III, 21). The context of Augustine's remark is somewhat different from our present discussion; but its upshot is the same: That appearances in the world of sensible Becoming appear anomalous or irrational to someone who does not understand how Nature operates within it (or manifests itself by means of it) does not mean that they really are anomalous, or that they would be so even for one who does understand this.<sup>7</sup>

An important element in Plotinus' metaphysical system which I have ignored almost completely in this essay is his theory of the intelligibles (or Forms). I shall not attempt to detail that theory here either;<sup>8</sup> I only will indicate in programmatic terms how Plotinus does conceive of intelligibles as postulates of Intellectual activity, yet of a sort which sharply contrasts with how Sextus and his Dogmatists conceive them. Recall that for Sextus and his Dogmatists, intelligibles are propositions or thoughts which postulate hypokeimena—i.e. objects that exist apart from their Intellectual conception (as well as beyond all sensory appearances)—and so they are nonevident and require a separate assumption, and so also proof, of their existence before we can assent to them. For Plotinus, in contrast, the objects of genuinely Intellectual acts or conceptions are far from nonevident. In fact, they are archetypically *self-evident*.<sup>9</sup> A genuine Intellectual object (or intelligible) exists solely by virtue of (and so "within") its Intellectual conception; it is an object of Intellectual *contemplation* wherein the contemplative act and its object are one. Since genuine Intellectual activity, in other words, is contemplation and since the contemplative object is already present within the activity of contemplation itself, there is no other outside or external object whose existence is merely a postulate of Intellect. Knowing *external* objects, or

knowing objects externally, is the goal (and need) of sense experience, not Intellection. Consequently, genuinely Intellectual conceptions must always be true and can never be false. Likewise, such notions as deliberation, plausible belief, assent, persuasion, hesitation, doubt, possible error, and the like, are simply out of place when discussing Intellect and its activity or mode of conceiving intelligibles.<sup>8</sup> And so once again, no separate justification or proof is needed to establish the existence of the objects of genuine Intellectual activity; any putative object whose existence is not self-evident in its very conception (and so also true by its very conception) simply is *not* an object of genuinely Intellectual activity—and this is especially the case with material hypokeimena.

I realize that the foregoing gives an idea of what Plotinus' intelligibles *are not* more than of what they *are*. Nevertheless, it does indicate further how Plotinus' Neoplatonism is a non-Dogmatic response to Pyrrhonism. In doing so, however, it focuses on Plotinus' hypostasis Intellect as the archetype, source or metaphysical agent of all Intellectual activity. How does this relate to the conceptions or thoughts of individual philosophers (or scientists)—the living targets of Sextus' attacks? It would, of course, be appropriate here to discuss Plotinus' views regarding our souls' relationship with Intellect—regarding the intellects-in-us and their relationship to archetypal Intellect. Roughly, since Intellect eternally "fills and illumines" Soul (see III.8.5, 10), and since our souls (as well as Nature) are offspring of Soul, insofar as we engage in genuinely Intellectual activities our conceptions will be one and the same with Intellect's and with those that inform Nature's operations.<sup>9</sup> Once again, however, this only points towards the outlines of the theory, and it also raises the further question of how we are to *recognize* when we are engaging in genuine Intellectual activities. Inasmuch as Plotinus' main concern is to distance his own intelligibles from those characterized by Sextus, however, I can only presume that he intends genuine Intellection "in us" to share the same features as those noted earlier regarding archetypal intellection—e.g. that since the objects of genuine Intellectual activity must already be present within the activity itself, their conception must be self-evident, and so they *must* be true and *cannot* be erroneous or false.

In closing, this section has contrasted Plotinus' intelligibles with those postulated by Sextus and his Dogmatists: First, they are not hypokeimena which underlie appearances and which are tailored to provide a refuge in our cosmos from the anomalies of appearances.<sup>10</sup> Indeed, Plotinus rejects the presumption that appearances really *are* anomalous, or irrational; he

conceives sensible Becoming to be in fact a final manifestation of intelligibility or rationality itself. Second, in their pure form at least—that is, as objects of genuine Intellectual activity or as prior to the objects of sense experience which manifest them—Plotinus' intelligibles are self-evident and so, it would seem, are true *necessarily*. No Pyrrhonian equipoise of competing (genuine) intelligibles is possible: During genuine Intellectual activity only *one* set of intelligibles is even *possible* (viz. those which are true *necessarily*; and so whose denial or 'opposing conception' must be *false necessarily*). Insofar as a conception (or its object) is merely possible, postulated, or putatively factual (contingent), it cannot be a genuinely Intellectual activity nor an intelligible.

I still have not articulated fully or precisely the nature and character of the items comprising the (one, self-evident, necessarily true) set of intelligibles which Plotinus believes is conceived by genuine Intellectual activity (i.e. archetypal contemplation, and its images in the soul of the cosmos and in human souls); nor have I discussed Plotinus' grounds for adopting the Platonic *megista genera* as *metaprinciples* defining Intellect's nature, its consequent contents (the intelligibles, or Forms), and any vertical effects (logoi and images) of it. Moreover, as I alluded when discussing archetypal rationality and our cosmos in section 2, the foregoing leaves the Plotinian natural philosopher (scientist) the formidable task of discerning precisely *how* each and every appearance, sensible form, or sense-observable Becoming (including seeming-anomalies) in fact *is* explicable as an instance of those intelligibles. My concern in this section, however, has been with Plotinus' historical context and, in particular, with Skepticism in its classical form(s). In that regard, moreover, Plotinus is clearly no friend of Pyrrhonism, even unwittingly. Plotinus' well-known insistence that *true quietude* can be found only in Intellect (and the One) can now be seen as—far from an abandonment of rationality and its (scientific) applications in understanding our cosmos—potentially a profound source of renewal for the so-called scientific spirit of the Ancient Greeks as they sought to understand the phenomena and puzzles of our cosmos.

5. Galileo, 15 & 412.
6. Galileo, 14.
7. Galileo, 335. Alexandre Koyré argues that the Platonic (or Neopythagorean) approach adopted by Galileo severs scientific theory from the observable cosmos and, as a result, rests upon a "basic contradiction: it requires a total conversion, a radical substitution, of a mathematical, Platonic world for the world of empirical reality...while at the same time it renders this total substitution impossible, since instead of explaining empirical reality it does away with it, because instead of saving the phenomena it creates, between empirical and ideal realities, a fatal chasm of unexplained facts": *Galileo Studies*, translated by John Mepham (Atlantic Heights, NJ: Humanities Press, 1978), 155. In contrast, see William A. Wallace, "Galileo and Reasoning *Ex Suppositione*," *Prelude to Galileo*, ed., W. A. Wallace (Dordrecht, Holland: D. Reidel Publishing Co., 1981), 129–159. As Ernst Cassirer also sees it, Galileo represents the last stage of development in the Renaissance conception of the relationship between mathematics and empirical reality, concerning the beginnings of which Cassirer remarks that "So long as definite criteria of experience were not created through the medium of mathematics and through the other new intellectual means furnished by it, the empiricism of the Renaissance lacked objective standards of value and any principle of selection among the teeming phenomena"; but, after a transitional stage whereon Koyré's assessment might be *apropos*, in Galileo "the empirical is no longer to be resolved in the ideal, therewith stripped of its specific character. On the contrary, the ideal can only be genuinely fulfilled in the empirical, where it is tested and justified"—*The Individual and the Cosmos in Renaissance Philosophy*, translated by Mario Domandi (New York: Harper & Row, 1963), 151 & 172.

9. Galileo, 336.
10. A. H. Armstrong translation (Loeb Classical Library): *Ennead* III.2.1, 28–37.
11. Armstrong translation: *Ennead* III.2.2, 2–8.
12. Dominic O'Meara maintains that Plotinus rejects Plato's notion of a (or the) divine, cosmic craftsman (or *demiurge*) because (1) "the world must derive from one ultimate source"; (2) "soul, and only soul, is the proximate cause of the world"; and (3) "[h]e accepts the Aristotelian claim that natural

processes are far superior to human craft" in that (3a) "nature does not need to calculate and deliberate; it does not toil over its work" and (3b) it "does not work on matter, as it were, 'with its hands' or with instruments...[but it] produces without moving"—Plotinus: *An Introduction to the Enneads* (Oxford & New York: Oxford University Press, 1993), 70–76. These points are important, and accurate. However, they do not entail a wholesale rejection of Plato's notion. Plato himself surely recognized that this conceit is but an image, even a metaphor, for his *divine, metaphysical demiurge*; and O'Meara is correct to point out various respects in which Plotinus' use of that conceit must denote a reality, or feature of reality, which differs from its human model even more so than Plato's does. As we shall see below, however, Plotinus *does use* the notion in his own discussions of our cosmos' archetype and vertical cause(s)—and so he hardly could be *rejecting* it—since it *does* convey quite well certain features of our cosmos' metaphysical aetiology and archetype. Perhaps among other things, it conveys the intelligence inherent in that vertical order; its unfailing reliability, if you will; and the fact that it yields a product which is not some amorphous, unintelligible mess of matter but which is shaped, ordered, (well-)formed, and the like. For, central to Plato's classic notion of a craftsman or artisan is that she possesses *art*—i.e. a set of (intelligible, cognitively discernible) *principles* and *standards*—and she is eminently accomplished at crafting products which conform to those principles and standards. At least in *these* regards, Plotinus *does not* consider craft-activity inferior to natural activity but a feature of it—or, perhaps, a *precondition* for it (see section 1 of this essay).

13. Armstrong translation: *Ennead* III.2.3, 7–9.
14. Thus, in *Ennead* I.8.4, Plotinus also argues that "bodies" may be said to "partake in matter" insofar as they are considered to be deprived of life, to destroy one another because of their (purportedly) disorderly motions, and to hinder Soul's operation and so to evade substance (*ousian*) as they continually flow or move. But insofar as we thus conceive of bodies as partaking in matter, we are not thereby attributing to them a (material) *substance* of their own; rather, we are conceiving of them as *evading* or *departing from* substance. Thus, in *Ennead* II.4.12 & 14, Plotinus argues further that matter, considered absolutely or by itself, *seems* to be a hypokeimenon—a substrate for sensible qualities. So considered, however, matter does not even possess size, nor even corporeality (*sōmatotēs*). Instead, its distinctive nature (*idiotēs*) is purely *relational* and is not really "absolute" at all; it becomes purely "other than"—a privation or taking away of qualifications and delimitations from reality. In short, something is *material* just insofar as it departs from, or is deprived of, substance or Being.
15. See, for example, *De Anima* III.7, 431a15 & 431b3.

16. In *Ennead* II.3.13, Plotinus explicitly interrelates the degree to which something is lifeless (or dead) and the degree to which it is impotent and passive.
17. Indeed, Plotinus argues in *Ennead* II.9.16 that the first step in our ascent toward recognizing the real substance and causes of our cosmos lies in recognizing order and proportion within it.
18. Thus, in *Ennead* I.4.3, 34–41, Plotinus distinguishes *levels* or *grades* of life (rather than distinct sorts of life), where the True, Real or perfect life is that of the intelligible world and where the various sorts of life we commonly distinguish in our cosmos are in fact various incomplete grades or traces of that archetypal Life.
19. Armstrong translation: *Ennead* III.7.4, 29–33.
20. Dominic O'Meara argues that Plotinus' solution to the Platonic problem of the "relation between intelligible and sensible reality" revolves around effecting a "reversal" in the way in which we conceive that relation. Whereas Plato (at least until his *Parmenides*) conceived the relation from the perspective of (sensible) particulars—as one wherein, in his most common vocabulary for this, particulars participate in intelligibles (Beings, or Forms)—Plotinus conceives the relation from the perspective of intelligibles, i.e. as one wherein intelligible reality is present in sensible reality (or particulars) and, more precisely, as one whereby sensible reality has intelligible reality present in it by virtue of its being *causally dependent* upon that higher reality. It seems, then, that on this approach Plotinus is seen to resolve the Platonic problem (1) by considering the Platonic expression for the problematic relation—'x participates in F'—to be reducible to (or, perhaps, to be replaced by) the metaphysically more perspicuous expression 'x is causally dependent (vertically) upon F'—perhaps by way of first reducing it to, or replacing it with, 'F is present in x'; and then (2) by explicating 'x is causally dependent upon F' in context with explicating the procession (or "derivation," O'Meara acutely prefers) of all reality from the One, down to its limit (sensible matter)—see *Plotinus: An Introduction...*, 22–27. This approach is ingenious, fruitful and, I think, right-headed. At the same time, however, there is something to be said for Plotinus' continued use of the Platonic participation-relation to connote features of the relationship which are not connoted (at least not evidently, or explicitly) by the presence-, or the causal dependency-, relation. Most especially, a key feature of Plotinus' understanding of Platonic participation that there is a sense in which Becoming possesses (manifests, exhibits, or is metaphysically related to) part of Being, and so may be perspicuously said to *participate* in Being. In the opening section of his *Parmenides*, of course, Plato worries about the fact that (in Greek) 'participates in' suggests or connotes 'has a part of', and so also that Being must somehow be comprised of 'parts' which are distributed or apportioned among sensible things—as a (physical) sail may be viewed as comprised of spatially extended parts (contiguous portions of

sail-cloth) which may be distributed over various objects were it draped over them. Plotinus, of course, would reject *this* depiction of Being as much as Plato did. But although Being does not come in parts which are distributed among sensible things as surface-portions of sail-cloth might cover various objects (i.e. one part uniquely covering, relating to, or exclusively possessed by each object), it is nevertheless true of *all sensible things* that each and every one of them possesses a *part of Being's nature*—most especially, we have just seen, that part of its nature (and so of its contents, the Forms) defined by Motion (and *sans* its—and their—Rest). Thus, 'x participates in F' means, or at least entails, 'x is F-in-Becoming' or 'x is F's Motion [*sans* its Rest]'. To be sure, this does not invalidate the approach I abstracted above from O'Meara's discussion. For one thing, Becoming participates in Being in this way (or sense) only *because* Soul seeks to 'learn' Being by expounding it, and so by means of (*dia*) a logos whose sequential (or sequencing) activity necessarily expounds it *sans* its Rest. For another, the possibility of two numerically distinct (sensible) particulars participating in the same intelligible—i.e. how it could be the case that x is F-in-Becoming and y is F-in-Becoming, where x is not (identical with) y—can, likewise, be explained in Plotinian terms only by understanding the natures and operations of the items comprising his metaphysical system of vertical causes (or derivations from the One towards sensible matter). The point, however, is that—as I argued previously regarding Plotinus' use of Plato's *демиург* notion—his use of the Platonic 'participation' vocabulary should not be reduced, replaced, or dismissed too quickly; it expresses, or at least entails, important features of Becoming's relation to (archetypal) Being which are not obviously, or at least explicitly, conveyed by O'Meara's other expressions for that relation—even if those features' explanation(s) require other, metaphysically more perspicuous terms.

21. Similarly, Plotinus argues in *Ennead* I.8.6 that the Good (i.e. the One) just is substance (*ousia*) or the archetype of substance, and that the contrary to universal substance (as all "flows from" the One) is not another *type* of substance but *nonsubstance*. Thus, Plotinus indicates in *Ennead* II.9.3, 10–13, that secondary (incomplete) life exists just so long as primal Life exists, since secondary things always exist just from the higher things themselves; and in *Ennead* III.3.7, he uses the image of things in our cosmos existing by "flowering from" their principles (*archai*).
22. Accordingly, Plotinus maintains that Intellect is defined by its own intellectual activity (*νοῦσις*), so that the "two" are in reality truly one (VI.7.41, 18–21).
23. Armstrong translation: *Ennead* III.8.8, 27–29.
24. See, for example, III.8.8, 31; III.8.9, 1–7; and VI.7.15 & 16.
25. See *Phaedo* 96–101, and *Timaeus* 49–53.
26. *Physics* II.1, 192b.

27. See, for example, IV.2.2; V.3.15, 13–15; V.3.17; V.6.3; VI.2.5; VI.7.17; and VI.9.1 & 2.
28. More generally, Plotinus argues that Soul is responsible for all order inasmuch as it is a power second in the order of real activity only to Intellect (IV.4.16, 18–20); for, Soul is that which took power into life from that higher life (i.e. Intellect's) which streamed into it (VI.7.31, 1–4).
29. Indeed, Plotinus argues, what Soul most essentially gives to our cosmos through its logos (Nature) is one, single life (see, e.g. IV.4.32 & VI.5.12).
30. Similarly, in *Ennead* II.1.3, 1–4, Plotinus argues that our cosmos shares in immortality (archetypal self-preservation) by virtue of the fact that, although it is always flowing, it flows only within itself and never “out of” or “away from” itself.
31. Although Soul does not itself possess size or mass, Plotinus argues, it must nevertheless be *present* wherever there is any size or mass (see IV.2.1, 70, & VI.5.9). Moreover, wherever Soul is present, it is *fully* present (or is present in its entirety or full self-identity). In this regard—and contrary to what some recent commentators on Plotinus suggest—Plotinus *contrasts* Soul's ubiquity with sweetness, whiteness, and the like in *Ennead* VI.4.1, rather than comparing it with them.
32. See Cicero's *Prior Academics*, especially chapters xxxi–xxxiii, xxxix, and xlviii.
33. Sextus Empiricus, *Outlines of Pyrrhonism* (Loeb Classical Library edition), I.vii, lix, and lxi.
34. Sextus, *Outlines* I.xi.
35. Sextus, *Outlines* I.vi & I.xii, 29.
36. In *Outlines* I.xxix, Sextus attempts to diffuse possible objections to his acceptance of apparent anomalies as really anomalies in appearances by claiming that this is not a *dogma* but simply a *fact* (*pragma*) that everyone recognizes. Of course, by saying it is not a dogma, Sextus means that the Pyrrhonist restricts his belief in the reality of the anomaly to appearances and does not commit himself on whether any underlying causes or material substrates of the anomalous appearances are also anomalous (see *Outlines* I.xiv, 94). It is important to keep in mind the nature of Dogmatism as understood by Sextus whenever discussing his own Pyrrhonian concepts and claims, lest one be led into seeing inconsistencies in Sextus' philosophy that do not exist. Thus, David Sedley, for example, argues that it “is clear from Sextus' usage that *epoche* for the Pyrrhonist is no longer suspension of assent, since despite his ‘*epoche* about all things’ he does assent to appearances, over which he has no control”: “The Motivation of Greek Skepticism,” *The Skeptical Tradition*, ed., Myles Burnyeat (Berkeley: University of California Press, 1983), 9–29; 19.
37. Sextus, *Outlines* I.vii, 14 & I.viii.
38. Sextus, *Outlines* I.xii, 33.

39. Sextus, *Outlines* I.xxx. Sextus' understanding of the “nonevident things of Dogmatism” is further emphasized in *Outlines* I.xxxii, where he argues that the principal difference between Pyrrhonism's non-Dogmatic reliance on appearances and Protagoras' philosophy that humans are the measures of all things is that Protagoras dogmatically held that the explanations (logoi) of appearances still *subsist in matter* (*hypokeisthai en tō hylē*). (Hence, again, we must avoid the sort of common interpretative mistake mentioned above in n36.)
40. Sextus, *Outlines* I.iv, I.ix, and I.xix, 190.
41. See Sextus, *Outlines* II.i, 7–9.
42. Sextus, *Outlines* II.i, 4 & 9.
43. Sextus, *Outlines* II.vii, 72 (R. G. Bury translation: Loeb Classical Library).
44. See Sextus, *Outlines* I.xiv, 115–117 & 122; I.xv, 172–177; and II.v, 34–41.
45. Indeed, Plotinus does not posit a real hypokeimenon to the sensible cosmos at all. Observable ‘material’ bodies may be *provisionally* conceived as mixtures of soul and matter; ‘matter’ does not denote a real substrate for Plotinus, however, but the darkening of Soul's illumination as it descends (see I.8.14).
46. Plotinus likewise argues in *Ennead* I.4.8, 10—when discussing pleasure and pain—that things do not look (or appear) in the same way to a good (or wise) person as they do to others.
47. For example, I have emphasized Plotinus' doctrine that the object of Intellect's activity is in fact just Intellect itself since in its archetypal activity (contemplation) Intellect “turns towards” the One as its archetypal source. How, then, can Plotinus also conceive Intellect's activity to have a number of objects—intelligibles, Beings, or Forms? In *Ennead* VI.2.19 & 20, Plotinus addresses this question by distinguishing two phases of Intellect. In its first phase, Intellect's Being or substance is conceived to be prior to all Forms or shares of Intellect (*pro pantōn hōs eidōn kai merōn*). In its second phase, Intellect is conceived to be the supplier and leader (*chorēgos*) of these items. Forms are “shares” of Intellect because, like Intellect, each contains the cause of its reality within itself (VI.7.2, 26); indeed, they may be conceived as just various Intellectual powers, or powers of Intellect (VI.2.21, 7; V.9.6). Elsewhere, Plotinus depicts Intellect's second phase as a matter of it “overflowing” with Forms—shares or powers of itself—or “unrolling” itself, because of the superabundant power of its Life (III.8.8, 34–38 & VI.2.21, 58). This second phase provides a foundation in Being for the variety and order of Soul's operation as it manifests itself—through its offspring—in the world of Becoming.
48. Thus Plotinus, like the Pyrrhonist, does not “assent” to nonevident things. Unlike the Pyrrhonist, however, Plotinus maintains that both speculative and practical wisdom (*sophia kai phronēsis*) consist in contemplating what lies within Intellect—its archetypal unity and overflowing power (I.2.6, 13). For,

even when judging appearances or sensory impressions, our reason—which formulates every judgment—contemplates Forms, since reasoning is essentially an Intellectual activity (see I.1.9, 19–22). Indeed, even *praxis* is in fact an “attempt at contemplation,” we have seen in *Ennead* III.8.

49. See, for example, I.4.9, 28–30; III.5.7, 50–54; III.7.4, 1–13; IV.3.18; V.1.4; V.3.1, 5 & 6; and V.5.1 & 2.
50. Thus, Plotinus insists that sciences are *logoi* of Intellect present in our souls, by virtue of Intellect itself—the cause of all science—being present in the soul (VI.9.5, 10–13). For, all rationality—whether scientific or just “common judgment” on appearances—comes from Intellect (see III.6.2, 32); and this is so, not just for thought (*to noein*) “simply and absolutely considered,” but for individual persons (see II.5.7, 50–54). How this conception of all “true thoughts” leads Plotinus to the self-transcendence of intellectually active souls and their resulting union with archetypal Intellect as the true agent of their intellections is articulated, for example, in *Ennead* IV.4.2. As for Nature, Plotinus argues that the diversity and order manifest in its product (our cosmos) is explained by the fact that Nature—itsself a *logos* of Soul—contains within its unifying, productive power a model or pattern (*paradeigma*) constituted from *logoi* of Being, to which Nature is subservient in its operations (IV.4.12). The basis for Plotinus’ notion that a *logos* of Soul (e.g. Nature) will contain its own set of Being’s *logoi* is the two phases of Intellect noted earlier. Plotinus postulates that Intellect in its unfolded phase *is* the Form (*eidos*) of Soul, while in its primal phase Intellect *gives* Form to Soul by giving it *logoi* of itself (V.9.3, 31–39). In these terms, then, the hypostasis Soul just is the outflow from Intellect, and this outflow itself contains a complete set of *logoi* or shares (Forms) of Being—hence, so too do any images of Soul (e.g. Nature), which ‘learn’ them through their own intellectual acts. Finally, in our cosmos, Form (*eidos*) denotes that which composes and “brings bodies to unity” (see I.6.2)—or what completes them by giving them an identity and actuality (see VI.7.3). Hence, what in Soul are intellectual acts (*noēmata*)—Forms as *logoi* of Being—“in matter” are additional *logoi*—viz. of Nature’s unifying power as subservient to the pattern of Form(s) from Intellect (see II.3.17 & VI.5.8).
51. I have argued in this essay that the bottom of Plotinus’ vertical order contains natural processes, activities or Becomings manifesting themselves to sense experience in various sensible forms. However, when viewed as composing a horizontal order in abstraction from their vertical aetiology, we commonly conceive these processes to coalesce around “centers of passivity and sources of production” within our cosmos (VI.3.4, 36); and we conceive these centers in turn to be nothing but individuals or “thises” which are not “predicable of any other” but instead are themselves the proper subjects for all the predicates we apply to the sensible cosmos (thus, see VI.3.5). We commonly designate these “thises” or proper subjects by proper names (e.g. ‘Socrates’) or, insofar as we do consider them as images of Being (or partakers in Form),

by sortal terms (e.g. ‘human’). As a result, we also can denote the Forms which “illuminate matter” through Nature with sortal names—for example, conceiving one of them to be the Form of Humanity (*anthrōpou eidos*) (VI.3.10, 18). But our common notions of proper subjects do not in reality designate independent or “underlying thises” (*hypokeimena*); and nor do these sortal discriminations really denote separate Beings, independent essences, or the like. Instead, the former are abstractions from observably close-ordered or tightly-unified processes or segments of Becoming as effected by Nature; and the latter reflect systematic or structural relations among objects and images of intellectual activity entailed by the metaprinciples defining Intellect’s nature—i.e. Being, Same, Difference, Motion and Rest (see, for example, IV.3.5; IV.4.12; VI.6.5; and VI.7.9).

## Preface

R. Baine Harris

Most Western scholars are not aware of the complexity, richness, and antiquity of Indian Philosophy. It is one of the oldest, if not the oldest, continuous philosophical traditions in history, antedating the speculations of the early Greeks, Egyptians, and Babylonians in its origin, and covers most of the whole spectrum of possibilities for philosophical speculation. Most of it is related to Hinduism in some way, but there are also significant Buddhist, Muslim, Christian, and atheistic philosophers within it. Some Western Scholars have some knowledge of the six major philosophical systems that allow a wide variety of philosophical interpretations of Hinduism, but are not aware of the various schools of thought within them or the wide variety of non-Hindu Indian philosophers.

Most philosophers, including most Indian philosophers, seem to be content to work mainly within their own given inherited philosophical traditions, with only minor concern for comparative philosophy. Due to recent advances in rapid transportation and communication East and West are now meeting and entwining their own economic and even political destinies with each other in ways not imagined a hundred years ago. However, this has not occurred in philosophy and religion. Eastern thought still remains eastern and Western thought still remains western and the "twain" have not really met. Most people, including philosophers, still remain suspicious of foreign philosophies and religions and are quite content to remain with their own traditional ways of thinking. Only a very few philosophers in the West and in the East have been concerned to make serious studies of the philosophical thinking of other major cultures.

In light of these facts, the meeting of a few American, British, Canadian, and Japanese philosophers with a group of eminent Indian philosophers in a conference held in New Delhi during the last few days of 1992 and the first few days of 1993 is of some significance. It was not

only a genuine exercise in comparative philosophy for the participants, it was also a small step forward in aiding East and West to meet philosophically. Although I had a role to play in the organizing of this conference, I was not able to be one of the participants, since I was busy having a heart attack at the time, a rite of passage that seems to come to all the men in my family when they reach a certain age. The conference was ably conducted by Paulos Mar Gregorios, who was then the Metropolitan of the Syrian Orthodox Church of Northern India and the President of the Indian Section of the International Society for Neoplatonic Studies and a past president of the Indian Philosophical Congress and the World Council of Churches. He was assisted by Professor John Mayer of Brock University in St. Catharines, Ontario, and Professor Christos Evangelou of Towson University. Numerous Indian organizations provided various forms of support, financial and otherwise and Dr. Gregorios mentions them in his introductory essay to this volume. Dr. Gregorios was able to complete most of the editing of this volume just a few weeks before his death, and I spoke with him by telephone about it less than a week before his death. Both the conference and the book are the product of his efforts and this book is now offered to the public in his memory.

The theme of the conference was "Neoplatonism and Indian Philosophy." Its stated aim was to note elements in certain Indian philosophies that appear to be very similar to Neoplatonism. Another concern was the controversy among Neoplatonic scholars about the influence of Indian philosophy on Plotinus, a topic on which Dr. Gregorios himself had some firm opinions, as he mentions in his own extensive introductory essay, and one also quite ably dealt with in some of the other papers. I have often wondered if philosophical notions must have one historical source from which they are historically transmitted or may occur in various places at various times as the result of a certain way of logicizing. Regardless of which is cause and which is effect, elements of Plotinus' monism are found in parallel ways of thinking of Indian writers throughout India's long history, and it is important to note these similarities.

All of the participants who have communicated with me concerning the conference have been commendatory of the way Dr. Gregorios and his associates conducted the conference, some even saying

it was the finest conference they have ever attended. All agree that another similar conference should be held either in India or in some other country within the next few years. I do hope that some younger minds will come forth with the knowledge, energy, and enthusiasm to carry on this cause now that Dr. Gregorios for sure, and I, for the most part, are out of the picture.

## A Word of Thanks

Paulos Mar Gregorios  
Editor

We owe a word of thanks to many. We can acknowledge here only a few of those who have made this volume possible. First to the International Society for Neoplatonic Studies and its indefatigable Executive Director, Professor R. Baine Harris of Old Dominion University in Norfolk, Virginia. He initiated the preparatory work for the Second International Seminar on Neoplatonism and Indian Thought, held at Teen Murti Bhavan (Nehru Memorial Museum and Library), New Delhi, from December 29, 1992 to January 3, 1993. He also did all the international work of organizing the Seminar, though he was prevented from personally attending due to ill health. Without his untiring effort, the Seminar would not have taken place.<sup>1</sup>

Equally important for the New Delhi Seminar was the support of the Indian Council for Philosophical Research, New Delhi. They gave us a substantial grant covering more than half of the organizers' cost of the Seminar and co-sponsored it. We wish to express our special gratitude to Professor R. Balasubramaniam, the Chairman and Professor Bhuvan Chandel, the Member-Secretary, who gave us all possible support and encouragement. Professor Balasubramaniam chaired the Valedictory session and gave us a scholarly presidential address. We are especially indebted to Dr. Ranjan Ghosh, the Director of ICPR, who personally and with great skill and dedication, handled the major part of the organisational work. To him and to the students from Jawaharlal Nehru University and Delhi University who helped him in the organisational work we owe a deep debt of gratitude.

Three other organisations bore the rest of the cost, and we are grateful to them: the Sarva Dharma Nilaya, New Delhi; the All India Association for Christian Higher Education; and the Manavata Mancir, Hoshiarpur (Dr. I. C. Sharma). We are grateful also to the other co-sponsoring bodies, namely the Indian Philosophical Congress, the International Society for Indian Philosophy, the Akhil Bharatiya Darshan Parishad, the Jamia Millia Hamdard, the Nehru Memorial Museum and

Library, and the Indira Gandhi National Centre for the Arts. Sri Ravindra Kumar, himself a consummate scholar, helped us most generously with the free use of the Seminar Room and other facilities at Teen Murti Bhavan.

I want to express my special thanks to Professor John R. A. Mayer of Brock University, who co-chaired the Seminar with me, and to Professor Christos Evangelou of Towson University, Towson, Maryland, Acting General Secretary of the International Society for Neoplatonic Studies.

Special thanks are due to several Indian philosophers who gave valuable addresses, the texts of which are not available, for various reasons, for inclusion in this volume. I want to mention especially Professor K. Satchidanada Murty's memorable keynote address on the One, Professor Richard Sorabji's stimulating lecture on, "Porphyry and Iamblichus on Animals", and Dr. Girija Vyas' (at that time Minister of State for Information in the Government of India) opening remarks as National Organising Chairman about the wide variety of Indian thought. Several of the papers read during the Seminar could also not be included in this volume.

Some of the papers have been edited; the Editor asks pardon for any slips in editing. Most of the papers are left as presented, with some subsequent changes made by the authors. The Editor believes that this volume, with all its imperfections, constitutes a major contribution to the comparative study of Indian thought and Neoplatonism. The papers in this volume suggest both that the matter is important enough for further research, and also that there is need to reexamine the questions we ask and the presuppositions with which we approach the topic. We also saw, during the Seminar, how Westerners, non-westerners, and Indians can sharpen their own conceptualisations by such inter-cultural dialogue.

Dr. Paulos Mar Gregorios

New Delhi  
February, 1994

## Endnote

1. The First International Conference on Neoplatonism and Indian Thought was held at Brock University, St. Catharines, Ontario, Canada in October 1976. The papers from this first conference are in R. Baine Harris, editor, *Neoplatonism and Indian Thought*, ISNS, Norfolk, Virginia, and SUNY Press, Albany, 1982.

**Does Geography Condition Philosophy?**  
**On Going Beyond the**  
**Occidental-Oriental Distinction**  
**An Introduction to the Second International Seminar**  
**on Neoplatonism and Indian Thought**

**Paulos Mar Gregorios**

The question has been raised time and again, and supposedly discussed threadbare, as to whether there are any demonstrable oriental influences in the thought of Plotinus. As I suggested at the beginning of the New Delhi Seminar in my brief remarks from the Chair, is it not time that we had a good look at the question itself? What are the assumptions that lie behind the question as it is formulated?

Let us begin by asking ourselves what we actually mean by the term "oriental". To what geographical region does it apply? Would it apply, for example, to the ancient Roman Province or *διοίκησις* of Oriens? If it does then the whole of the West Asian region of the Roman Empire would be meant, (the Diocesan (*Διοίκησις*) or Diocese means a group of Roman provinces under a Prefect or Viceroy) with the capital at Antioch-on-the-Orontes. In such a case the word *Oriental* would not include India in the scope of its meaning. But we know that even in Roman usage, the word meant everything East of the Bosphorus, or sometimes everything outside of Europe. "Oriental" is a very European word. We do well to be careful in the use of this word, particularly in view of the cultural connotations it carries. Sometimes it is parallel to calling the Germanic people "barbarians". It is basically the same spirit, of which we have examples in this volume, by which some Indian scholars sometimes dismiss western thought too lightly, without any major effort to understand it.

Most people, when they reflect on regional philosophies, think primarily of three groups: Western (mainly Euro-American, Classical, Medieval, and Modern Critical) philosophies; South Asian (including Ancient Pre-Vedic, Hindu, Jain and Buddhist) philosophies; and Far Eastern, (Taoist, Confucianist and Chinese Buddhist) philosophies. Certainly there were other philosophies not included in that threefold grouping. Even if there were not, the term "Oriental" would have to include the two latter groups, i.e., everything that is not Occidental philosophy would be *Oriental*!

To deny any oriental influence whatsoever in Plotinus is to deny even the influence of Egypt, where Plotinus was presumably born (in Lycopolis, either the one on the Nile Delta, or in the city of that name in Upper Egypt). He was brought up there as a child and he lived there for a good number of years of his adult life; Egypt certainly cannot legitimately be considered part of the Occident. I think we have to be just as circumspect in our denials as in our affirmations, as philosophers worth our salt. Let us then be done with loose statements in this matter, and state categorically: *There is no historical or philosophical ground whatsoever for the affirmation that the thought of Plotinus is totally free from all Oriental influence.*

I presume that the blurb on the Second Edition of *Plotinus* (7 volumes) translated by Professor A. H. Armstrong in the *Loeb Classical Library*<sup>1</sup> is not the work of Professor Armstrong himself. In any case someone who has more authority than the present writer should advise the Harvard University Press that it will be in the interests of scholarly accuracy to delete from the front and back flap of all seven volumes of future editions or reprints the unnecessary and incorrect statement: "There is no real trace of Oriental influence on his thought".

Let us proceed further to see what we can legitimately say in this matter. In order to do so, we will be on surer ground if we abandon the term *Oriental* altogether, for it was used by the Westerners (Europeans) to denote whatever lay east of their continent; its meaning was vague and imprecise; since Europeans had practically no west before the 15th century, it meant, for many Europeans, just what was not part of their world. It was what was east from the European perspective; the word *oriental* also came to have, perhaps only since the colonial period, a pejorative connotation: for many Europeans, what was not European was somehow inferior.

Besides, even today, both Egypt and Syria are still included by many in the Middle East and would therefore have to be regarded as part of the region denoted by the word *Oriental*. It would be much too laborious and from the start unfruitful to try to disprove all Syrian (e.g. Nemesius) and Egyptian (Ammonius Saccas, Alexandrian culture), and Jewish (Philo) influence on Plotinus. In so far as Plotinus was born and brought up in Egypt, he has to be regarded as an Oriental if that term is to be used at all. Talking about oriental influence on Plotinus is therefore, strictly speaking, nonsense.

So what we want to talk about is the influence of specifically Indian thought on Plotinus, not any so-called oriental influence on him.

Now, Indian thought is a fairly wide ocean, as anyone with even a cursory knowledge of India's vast and deep philosophical heritage should

know. Summaries of Indian philosophical thought have been attempted by many competent and not so competent scholars, both Indian and foreign. Even the best among them admittedly do not do equal justice to the Carvaka, Jaina and multi-schooled Buddhist as well as several Tantric schools of Indian philosophical experience, practice and reflection. In view of this formidably wide scope of Indian thought, it would not be very precise to speak of the influence of 'Indian Thought' in general on Plotinus. If someone has a positive affirmation to make about such influence, that affirmation would gain in clarity and refutability or critical examinability, if a particular aspect of Indian thought could be specified as having influenced Plotinus.

Perhaps we should consider the appropriateness of attaching any geographical labels at all to various schools of global philosophy. Every school we know is indebted to some school outside of its geographical region, either by way of ideas and categories adapted, or in terms of a polemic that generates new ideas.

If philosophy is some form of universal truth why should geography condition it? We have all to learn to shed some of our geographical and racial parochialisms in this regard. In our time we are called upon to regard all regional philosophies as the common heritage of all humanity, and to develop the notion of a global Common Human Tradition, which encompasses all the major trends in the heritage of humanity. All of us are called upon to focus on our common human identity, and our common global heritage, and to seek new human global philosophical perspectives duly enriched by as many regional philosophies as we can access.

Now we have to ask a third question as to what precisely we mean by 'influence'. If for example, the present writer, who is an Indian by birth but trained in the West, has read two books on Chinese philosophy, would he be regarded as having been influenced by Chinese thought? If again as a student at Oxford, he participated in an intensive three-month seminar on "The Tacit Dimension of Knowing" led by the Hungarian émigré, Professor Michael Polanyi, should he be regarded as influenced by Hungarian thought? Influence is rather too vague a concept to define or measure precisely.

I presume that no one disputes the fact attested by Porphyry that Plotinus was profoundly influenced by the teachings of Ammonius Saccas, whose lectures he attended for eleven long years, after having sampled and rejected those teachers in Alexandria who were recommended to him as the best in that city. Plotinus himself may have regarded Plato and Socrates as his basic saints or gurus and guides. Porphyry tells us that the only feasts Plotinus observed were the traditional feasts of Plato and

Socrates. But Ammonius was his living mentor, his preferred teacher. To affirm one is not to deny the other. If one has to speak about 'influence', we are fully justified, by the available evidence, in stating that Ammonius exerted a strong influence on Plotinus. One may even say that the influence of Ammonius was a decisive factor in Plotinus' reinterpretation of Pythagoras, Plato, Aristotle and the Stoics.

I know that the question, "Who was Ammonius Saccas?" will probably elicit a yawn from some of you. That is also a question that has been discussed "threadbare". Even at the risk of a few yawns and frowns, let us see where we stand at the end of the threadbare discussion.

It has been suggested by one imaginative speculator that the name Ammonius Saccas is a latinisation or hellenisation of the Sanskrit 'Muni Sakya' or *Sakyamuni*, which is a well known form of appellation for the Lord Buddha. If that were only demonstrable, we could have regarded Ammonius, whatever his nationality, as a Buddhist monk, who took on for himself one of the many names by which the Master was called. This was actually put forward by no less a scholar than Cardinal Daniélou, in his lectures on 'The Fourth Century' at the Sorbonne fifty years ago. Unfortunately it is probably only about as true as the other proposal that Pythagoras, or in Greek *Πυθαγόρας*, was a Buddhist monk and that his Greek name was simply a Buddhist monastic name he chose for himself, meaning Putha (original Pali or Prakrit which was then Sanskritized as *Buddha*) of the marketplace, taking *agoras* as genitive of Greek *ἀγορὴ* (=market). Let us leave aside these entertaining speculations, and get back to the question, "who was this Ammonius Saccas?" What in his teaching, according to Porphyry, made Plotinus say, "this is what I was looking for!" (τοῦτον ἐζήτηον).

I am unable to answer either of these questions. What can be said has been said by H. R. Schwyzer and E. R. Dodds and other careful scholars.<sup>2</sup> Ammonius lived ca 175-243 A D, while Plotinus lived 204/5-270, both for substantial periods in Alexandria. Ammonius was thus thirty years senior to Plotinus, who began his study of philosophy in Alexandria in 232, when he was twenty-seven.

According to Longinus, cited by Porphyry, Ammonius was the greatest linguistic and literary scholar (*φιλολογώτατος*) of his time, and no one had come anywhere near him in learning. Longinus himself, according to Porphyry "the most discerning critic of our time" (*κριτικώτατος*) was a fellow student with Plotinus of Ammonius, and calls Ammonius both *Platonikos* (*Πλατωνικός*) and *Peripatetikos* (*Περικηνητικός*).<sup>3</sup> But Ammonius wrote nothing, and told his disciples not to put in writing anything he said.

For eleven years Plotinus studied with Ammonius. We still need a proper exegesis of that key sentence of Porphyry's:

Καὶ ἀπ' ἐκείνης τῆς ἡμέρας συνεχῶς τῷ Ἀμμωνίῳ παραμένοντα τοσαύτην ἔξιν ἐν φιλοσοφίᾳ κτήσασθαι, ὥς καὶ τῆς παρὰ τοῖς Πέρσαις ἐπιτηδευομένης, πείραν λαβεῖν σπουδᾶς καὶ τῆς παρ' Ἰνδοῖς κατορθουμένης.

"And from that day continually staying with Ammonius, (Plotinus) acquired such a mastery of philosophy, that he became eager to gain knowledge of the teaching prevailing among the Persians, as also among the Indians."

Now, putting all that together this is what I get. Ammonius was both a great scholar and a great philosopher, well versed in Plato and Aristotle, as well as in the whole Greek tradition. Plotinus thought so highly of his teaching, in comparison with that of others available in Alexandria at that time, that he not only said the very first day: "This is what I was looking for", but also continued with Ammonius for eleven long years. If any single living teacher influenced Plotinus more than others, it was Ammonius. Ammonius, being an all round scholar, initiated Plotinus into the niceties and nuances of the teachings of Parmenides, Pythagoras, Plato, Aristotle and the Stoics, so that the latter achieved a good grasp of philosophy in general.

So far I hope everyone agrees. Whether Ammonius was also well versed in Persian and Indian thought Porphyry does not clearly say. What he does say is that the mastery of philosophy which Ammonius imparted to Plotinus was such that it kindled in the latter a great zeal to get better acquainted with Persian and Indian thought. That zeal impelled the nearly forty year old Plotinus to join Gordian's military expedition to Persia, not because he was interested in Romans conquering Persia or India, but because his teacher had told him that he must find out more about Persian and Indian thought. Obviously Gordian's expedition was a failure, and Plotinus had to flee for his life and came and settled down in Rome.

Shall we then say that, after that initial failure, Plotinus gave up every effort to know something about Persian and Indian thought? There certainly were, already by the first century, Brahmins and Buddhists in Alexandria. Did he ever try to contact them? Was literature from India and Persia available in the Alexandrian *Museion*? By the time we come to the third century, Buddhists have established themselves in Alexandria, with a *Vihara* or place of teaching of their own. Do you have reason to think that Plotinus gave up the effort to know something of Persian and Indian

thought after the Gordian expedition failed? Or did he continue to pursue that interest in Rome, where all roads met, including the ones from Alexandria, Persia and India? I leave these questions with you, and do not want to draw any specific conclusions at this point, except to point out that:

1. Ammonius Saccas taught philosophy in such a way to his student Plotinus that the latter felt it necessary to go and acquire some competence in Persian and Indian thought;
2. If the above is true, then Ammonius Saacas had some knowledge of Persian and Indian philosophy, which he most likely imparted to Plotinus as his student.

Let us now raise a fourth point. When Armstrong, or anyone else for that matter, says for example that "There is no trace of Oriental influence on his (i.e., Plotinus') thought" his/her argument must be that, if all elements in the *Enneads* can be explained as originating within the Hellenistic tradition, then there is no need to hypothesize "Oriental influence". But are such scholars, including Armstrong, assuming that the Hellenistic tradition itself is uncontaminated by anything coming from East of the Bosphorus? A cursory examination would reveal that the Hellenic culture and religion were 'Oriental', in the sense of just as much Asian-African as European, through and through.

### Hellenistic Religion

By Hellenism is meant that form of Greek culture which was shaped in and spread from the Eastern Mediterranean from the time of Alexander (the first Western empire-builder ca 330 BCE) for about four centuries. When the Romans took over the Empire in the first century BCE, Hellenism went into a down-swing, till it was resurrected and reinstated as Byzantine culture in the middle of the fifth century. When Plotinus lived and wrote, Hellenism was expressed mostly in the many attempts to revive, reintegrate and revise the ancient Greek religion and thought of Parmenides and Heraclitus, Pythagoras and the other Pre-Socratics, as well as Socrates, Plato and Aristotle, the Stoics and others.

Soon after Alexander, Alexandria, the Capital of Egypt, in Africa replaced Athens of Europe as the cultural capital of Hellenism. In that process Alexandrian Hellenism had absorbed many Asian-African (Syrian, Babylonian and Egyptian as well as others) elements; it thus became more cosmopolitan in its outlook and could no longer be regarded as strictly European.

Neither was Alexandrian Hellenism a secular philosophy. It was fully a religious system in which many philosophies flourished side by side. When Ptolemy I founded the city of Alexandria, its core was the *Μουσείον*, a community of learned and gifted men, headed by a Priest of the Muses. The community had its own ceremonies and rituals, and offering of sacrifices. The theurgical tradition soon became part of Hellenic culture and philosophy.

Hellenism was thus not just rational philosophy. Fundamental to it was the religious perspective, integral to all genuine philosophical reflection leading to experiential knowledge of Transcendent Reality. Plotinus was no exception. This religious perspective in Classical as well as in Hellenistic Greek culture expressed itself in three major areas, which one can discern in Socrates and Plato as well as in the Neoplatonist school as a whole:

1. the cult of the gods and daimons in temples and shrines dedicated to them;
2. the Gnostic and Mystery religions with their special revelations, initiatory rites and secret doctrines, and
3. the widespread magico-religious, or Tantric practices of invoking and propitiating the daemons or the Spirits to perform special tasks.

The main enemies of the three religious aspects of Hellenism were the Jews and the Christians whose influence was growing and threatening the very existence of Hellenistic religion and culture.

The point often overlooked is that all the three religious elements of Hellenism had a heavy 'oriental' aspect to them. The Hellenistic culture developed by borrowing liberally from Egypt, Syria, Persia and India, but not apparently much from China. It was always a two-way process. As Greek ideas and culture spread Eastward, the rich culture of the East supplied so much of new insights, so many new ways of doing things, to the Greeks. One can only illustrate here.

Where did Alexander of Macedonia learn empire building in the first place? The Greeks had no such concepts. The Persian wars not only opened up a new world of experience and possibility to the Greeks; it stimulated their resistance to political and cultural domination by foreigners who did not speak their language or behave as was thought proper in their culture. Scholars have been slow in recognizing the

enormous role played by the Persian invasions in stimulating Greek culture to great heights of glory and creativity in art, music, literature, poetry, philosophy, politics, rhetoric, historiography, mathematics, geometry and astronomy in the period immediately following the Persian Wars. I have no reason to think otherwise than that post-Enlightenment European scholars generally exhibit a great unwillingness to acknowledge Europe's debts to Asia. They forget what is acknowledged by learned Greeks, that the Greek civilisation owes much to Babylon, Syria and Egypt.

It was the same pattern in India in the wake of the Macedonian's rape of the Indus valley. The Greeks learned much from the Indians, mainly in philosophy and metaphysics, Indians began to be influenced more by Greek art, sculpture and drama than by Greek philosophy as such, which the Indian philosophers acquired some knowledge of, but found little reason to admire profoundly.

Early Greek religion had sages and seers, but no organized hierarchical structure. It had its oracles and soothsayers, but nothing like the Prophet or the Messiah as in the semitic religions. Hellenism developed various rituals and sacrifices; Neoplatonism developed its own theurgy, but most Neoplatonists simply went along with one or other of prevailing cults: the Eleusinian mysteries, the Dionysian Cult, and the more rational Orphic Cult. Plotinus, probably supported the Orphic cult.

Plotinus was a vegetarian. Vegetarianism was part of the Orphic tradition. He went into a seance in the Iseum or Temple of Isis, and a god appeared to him and held converse with him. Unlike us Moderns, Plotinus shared the belief of his fellow Hellenists in the existence of a world of gods.

The points to be emphasized here are two:

1. Insofar as Plotinus is a Hellenist, he is under heavy Oriental influence. This applies to his teacher Ammonius Saccas also. This is particularly evident in Numenius the Neo-Pythagorean of Apamea (2nd century), with whom Plotinus shared many ideas. It is even more evident in the thought and practice of Plotinus' successors in the Neoplatonic tradition.

2. The attempt to make Plotinus totally independent of Oriental influences seems more of an Occidental prejudice than a scholarly proposition based on the evidence. The West cannot lay any such monopoly claims to Plotinus. He belongs to the heritage of the whole of humanity, and he is rejected mainly by dualist Christians

and by devotees of the European Enlightenment's persistent superstition, the exclusive reliance on Critical Philosophy. Plotinus never belonged to the isolated Occident which in fact never existed. European culture developed historically by heavy borrowing from Babylon, India, Syria and Egypt, perhaps also from Iran and Palestine, and Plotinus drank deeply from that composite, creative, cosmopolitan culture of the Mediterranean, which today belongs to the world's common heritage.

It is in this context that many of the participants felt that it was a waste of time to discuss the question about "Oriental" influence on Plotinus. We found it much more useful to examine the affinities and differences between mainstream Indian thought and Plotinus.

### I. Plotinus and Indian Thought - Some Primary Divergences and Affinities

1. The Soul: We became aware that the primary area in which to explore the question of Affinity/Divergence between the Plotinian category structure and that of Indian thought in general was the conceptualisation of the *ψυχή* or the Soul rather than that of the *One* which after all is strictly nonconceptualisable in both traditions.

The Plotinian Soul (*ψυχή*) is basically Aristotelian-Platonist, and does not easily fit into the categories in which Indian thought conceived the parallel expression *jivatma*. The First *Ennead*, in Porphyry's arrangement, begins with a discussion of the Soul. It is basically *Form* or *εἶδος*. It gives form to body but does not receive anything from the body. It is a simple, non composite substance, as is also the *jivatma* in India. Soul and soulness do not exist independently. To be Soul is to exhibit soulness. *Τὸ ψυχή* is identical with *τὸ ψυχή εἶναι*. The soul cannot thus be described in terms of its composite qualities, since it is simple. The 'procession' or coming forth or origin of the *ψυχή* is from the *One*, through the *Noûs*, born into the world of multiplicity, located in the universe generated by the *World-soul*. This *World-soul* or *Soul of All* is also generated by the *Nous*, as is the human soul, but the latter is not derived from the *World-soul*. It must make the return journey, the *ἐπιστροφή*, back to the *Noûs* and through the *nous* to the *One* (*τὸ εἶν*). Professor Mukhopadhyaya argues here that the Samkhya doctrine of the coming forth of multiplicity from the non-conscious *Pradhana*, and of consciousness or *Purusa* from the *One* is a process of Emanation. This can be debated. Nothing like this procession-recession of everything from the *One* and back to the *One*, is conceived in the Indian tradition as far as I

know. Pralaya-Vilaya or expansion-contraction, yes, but not exactly proodos-epitrophe, or emanation-return or procession-recession.

The soul of Plotinus is *sui generis*. It is both indivisible and divisible, or *μεριστός ἀμέριστος*, unlike anything else. Indian thought offers no explicit parallel to this conception of the soul or *Jivatma* being *sui generis* or divisible-indivisible; perhaps some aspects of Samkhya imply it.

Nor would it be easy to find something like the Soul as one of the Three Principles of Plotinus in the Indian Tradition. For the Indian tradition the *Jivatma* cannot be a distinct hypostasis at all. For Plotinus, it is just three, no less, no more: the *One*, the *νοῦς* and the *ψυχή*. In *Ennead* II:9 *Against The Gnostics*, Plotinus attacks the Gnostic multiplicity of principles, and insists that the principles have to be three, no more no less. One does not find such a three-fold or quasi-trinitarian Principle *One*, *νοῦς* and *ψυχή* in the Indian tradition; of course there are many three-in-ones in the Indian tradition, but not anything like One-Intellect-Soul.

There are, however, affinities between the Plotinian *ψυχή* and the Indian concept of the *jivatma*. The *ψυχή* does not suffer; pathē or suffering belongs strictly to the body. Here Plotinus is more Aristotelian than Platonist, yet somewhat original. He makes the distinction between the higher and lower souls. But how can he make that kind of distinction within the *ψυχή* which is simple? In order to make the distinction, Plotinus conceives, to this end, a new entity called "the living being" or τὸ ζῶον. It is this entity that is composite, constituted of soul and body. The first *Ennead* is about this composite entity, the living being, rather than about the soul as such.

When we come to the later Neoplatonists, we see a slightly more complex pattern of this soul descended into the world of matter, which is no longer the simple *ψυχή*, but a composite entity of which the *ψυχή* is one part. The soul as it descends from the hypercosmic realm acquires its own vehicle, the *ὄχημα*. According to Iamblichus, the *ὄχημα* is created by the δαίμονες. But the *ὄχημα* is not the physical body; it has a divine origin; it is not something to be cast away. In fact, in Iamblichus at least, the *ὄχημα* is indestructible and therefore eternal.

This certainly is not the place for an extended discussion of the concept of *ὄχημα*; but we note that what theurgy does in Iamblichus is to purify the *ὄχημα* of the soul, permitting its union with a particular god allocated to it. Then the light of the god shines upon the soul in its *ὄχημα* and begins the process of the soul's elevation to the gods. "ὄχημα" has a parallel in the Indian concept of *sukshma sarira* or ethereal body. In both cultures 'out of body travel' occurs through the *ὄχημα* or *sukshmasarira*. This non-material body is the vehicle of the soul also for experience in the

material world. A comparative study of *ὄχημα* and *sukshmasarira* is likely to show great affinities as well as some differences.

But Plotinus' discussion of the soul in *Ennead* IV: 2 (Armstrong's IV: 1) is one of the most sophisticated such discussions in literature. The Soul is not a body, not a harmony of non-corporeal natures, not an *entelechy* as Aristotle thought it to be; it belongs definitely to the intelligible world, which in the Platonic tradition, is the home of abiding Reality; it shares in the Divine (τῆς νοητῆς φύσεως, καὶ τῆς Θεῆος Μοίρας, Armstrong IV:1:5-6). There is no attempt to say that the *ψυχή* is identical with the *One* as in the Indian tradition. Plotinus divides Reality into two classes: one group, the sensible world, is composed of the *αἰσθητὰ μεριστὰ καὶ σκεδαστὰ*, or the sensibles, the divisibles, and the perishables. The soul does not belong to this class. But neither does it belong to the other class the *οὐδαμῇ μερισμὸν δεχομένη, ὁμοιῆς τε καὶ ἀμεριστῶς*, or in no way divisible even conceptually, partless and unpartible, unextended (*ἀδιάστατος*), without spatial location in anything else. The Soul is not in that class either.

The Plotinian Soul does not belong to the class of sensibles, or to the class of purely intelligibles, but belongs to a third class of its own the divisible-indivisible-at-once nature, (ἡ δὲ ὁμοῦ μεριστὴ τε καὶ ἀμέριστος φύσις, ἣν δὲ ψυχὴν εἶναι φασίεν). This is of course an aspect of the Platonic tradition, where according to *Timaeus* 35 A1-14, the Artificer of the Universe "mixed a third form from both, from the indivisible which is always in the same state, and that which becomes divisible in the sphere of bodies". The Plotinian soul is an intermediary, a frontier being, between the intelligible world and the sensible world. Here of course Plotinus is not speaking of the individual human soul as such, but about the single unique entity called the Soul, in which the All-Soul and the Human Soul participate. A parallel conception to this cannot easily be located anywhere in the Indian tradition, as far as I know.

The body, whether it be the human body or other bodies in the Universe, come into being just as the Soul, so to speak, goes out of itself to take or form a body, according to Plotinus. Without the All-Soul, the Universe as such has no existence. Existence is what the Soul gives to the body.<sup>5</sup> Clearly, Plotinus' conception of the soul is partly original, but its roots are strictly in the Platonic tradition, and it seems to have no parallel in Indian thought.

## II. General Discussion

In the course of the discussion in the seminar, some other interesting points came up. Here we can only pick up a few highlights of what was indeed a very rich discussion.

1. From the beginning of our discussion it became obvious that it was difficult to define the scope and limits of what is called Indian thought. We have to include Vedic, pre-Vedic, and Avedic thought, the thought of Brahmanas and Sramanas, the Jain tradition which claims to be both avedic and pre-Vedic, the Buddhist tradition which is certainly Avedic, the great Bhakti tradition in its many different forms, Islamic, Sufi and Sikh thought, recent western liberal and western Marxist thought, as well as Christian and Zoroastrian thought, all of which flourished on Indian soil and have not only made rich contributions to Indian culture and thought, but also form an integral part of every Indian's heritage. We are certainly unable to do justice to the vast ocean of Indian thought as it has developed through millennia. When we try to compare Plotinus or other Neoplatonists with Indian thought, it would therefore be wiser to indicate the particular school of Indian thought one has in mind, rather than Indian thought in general.

2. The question came up also about Neoplatonism being both religion and philosophy. In fact classical thought in India as well as in the Mediterranean region, made no distinction between religion and philosophy. Nor did it make religion a compartment of life, as the civilisation of the European Enlightenment often does. In fact the Critical Philosophy of the European Enlightenment writes off any philosophy with the taint of religion as not philosophy at all, since it is dependent on revelation and not exclusively on human reason. For us Easterners, and I think, for many thinking people elsewhere, this appears to be a persistent and pernicious Western prejudice or superstition, without either scientific or philosophical basis.

We must therefore boldly reject this superstition and take into account the whole religious-philosophical matrix of the Eastern Mediterranean (north, east and south, but not west, of the sea), when examining the thought of Plotinus and later Neoplatonists. The thought-world of Parmenides and Heraclitus, of Pythagoras, Socrates, Plato and Aristotle, of the Skeptics and

the Stoics, the Epicureans and to a certain extent the Cynics, was always religious and philosophical at the same time. So was that of Plotinus; any non-religious interpretation of Plotinus would be off the mark.

3. The Asian-African (not to use the expression Oriental) thought-world of Alexandria in the third century was one which had fully assimilated the Greek tradition, but was in the process of reformulating it in many different schools, e.g. in Christian (Clement and Origen), Gnostic (the Nag Hammadi documents), neo-Pythagorean (the Therapeutes), Middle Platonist-Aristotelian (Ammonius Saccas, Numenius), and Stoic-materialist frameworks and categories. Plotinus was not only aware of these schools, but often wrote to question and correct some of the views expressed in these schools. But none of the thinkers of this age made the distinction that some moderns make between Oriental and Occidental. Neither was any of the schools exclusively Oriental or Occidental. The same applies to Plotinus. Plotinus heavily influenced many later systems of perceiving reality, especially Jewish, Muslim and Christian medieval and post-medieval philosophy. All these three traditions are Asian or "Oriental" in origin.

4. Plotinus specially targeted three contending forces in Alexandria and the Roman Empire: Stoic Materialism, Gnostic speculation, and Christian soteriology. There was already much tension in the culture among three approaches to salvation: Theoria, *θεωρία* and *τα μυστήρια*. Plotinus definitely emphasized *θεωρία* or a vision attained by training the mind. *θεωρία* on the other hand emphasized acts of worshipping God or a god, rather than mental-intellectual contemplation, through which *καθάρσις* (spiritual purification), *ἐλάμψις* (inner illumination) and *ἐνωσις* (becoming one with the Divine) were to be achieved. Many who could not scale the ascents of mental discipline, preferred this way of *θεωρία* in later as well as even in classical Neoplatonist practice. (Iamblichus, Proclus, and so on.)

Plotinus did not wholly approve the growing practice of theurgy in his tradition. For a true Neoplatonist to practice theurgy is similar to a pure Advaita Vedantin practising a Bhakti cult in India. It is often done, but is very difficult to justify philosophically. As far as the neoplatonist use of theurgy is concerned, Plotinus seems to be an exception in the Neoplatonic

tradition as a whole, which was heavily theurgic through and through. Plotinus emphasized *θεωρία* or mental contemplation, while the Alexandrian tradition as a whole tended to put more faith in *θεουργία* and *τοῖς μυστήριας*; even the Gnostics, who seemed to put more emphasis on ■ secret *γνώσις* and thus to be more intellectually oriented, practised some form of theurgy or ritual.

5. It is specifically in relation to *θεουργία* that there seems to be a major gap between Plotinus and his successors, most of whom were Asians who put more emphasis on acts of worship than on mental or intellectual exercises. Both Porphyry and Iamblichus made *θεουργία* central. Plotinus probably practiced some form of *θεουργία* but refused to give it central emphasis, looking upon *θεουργία* with a measure of disdain, as good only for the mentally incompetent.

Professor Berchman's paper on "Rationality and Ritual in Iamblichus and Proclus", along with his bibliography, is very significant in this connection. Ritual has its own rationality, different from scientific rationality. Theurgy establishes contact with reality at a level different from that of scientific rationality, effects a different entry into the intelligible world and achieves communion with the divine; this is more obvious in his successors than in Plotinus himself.

6. Since Professor Berchman could not attend the seminar, his paper was not discussed in detail. But when we speak of affinities between Neoplatonism and Indian thought, this aspect of Theurgy and its relation to the Tantric and the Vedic-Sacrificial or Purvamimamsa traditions in India should not be overlooked. What the west pejoratively calls 'magic', as Professor Berchman clearly shows, is a highly rational way of operating upon reality. In India both the Tantric tradition and the Purvamimamsa tradition are basically theurgic in nature. This means that in looking for affinities between Neoplatonism and Indian Thought, Theurgy-Tantrism should receive ■ fuller treatment than it hitherto has. While it may have been true that at one time western scholarship was rather allergic to any notion of Theurgia (e.g. E. R. Dodds, 1947 and H. Lewy, 1946) things seem to be changing.<sup>6</sup> More recently Professor H. J. Blumenthal of Liverpool has made a significant philological contribution to the discussion in his "From

KU-RU-SO-WO-KO to *Theourgos*: Word to Ritual", in: the Liverpool Classical Monthly.<sup>7</sup>

7. We sought to compare Plotinus' One (*τὸ ἓν*) with the Indian concept of *skamaditiam*. In both traditions, the limits of the conceptual are recognized. The conceptual cannot by any means lead us to the *One* of Plotinus, or to the *ekam* of the Hindus. In this most Indian traditions would agree with Plotinus that the conceptual cannot attain to the Transcendent Divine, and that the *One* has to be known in a way other than the conceptual. In Sankara Vedanta, we call it *paravidya* or the knowledge that transcends. Modern critical philosophy has no such category, and this seems to be its basic weakness.

8. Both traditions recognize the key epistemological role of self-purification in attaining to the knowledge of the Divine. While the Plotinian tradition refers to this need of *κάθαρσις*, the Indian tradition goes to great lengths in working out and prescribing the physical and mental exercises which make one capable of receiving the grace of divine illumination and unity. Not only in the Yoga System of Patanjali, but also in the Bhagavadgita, these systems of *nidhidhyasa* are described at length. It would be a useful study to compare the purificatory disciplines in various Indian schools with the Greek disciplines of self-purification. We can also ask the question whether the European Enlightenment tradition of Critical Rationality also has its own *nidhidhyasa* or *κάθαρσις*, in terms of training the mind for critical rational thinking.

9. It was suggested that the comparative roles of *ἔργος* and *bhakti* in the ascent of the soul to the divine would be worth careful study. Equally important would be a comparative study of the role of worship, or Indian *aradhana* and Greek *θεουργία* (related to the concepts of *εὐσέβεια* and *εὐσεβής*) in self-purification. Indian Tantrism also bears striking resemblances to Neoplatonic *θεουργία*. These need careful further study.

10. Both traditions acknowledge that the *One* is beyond all predicates. If the *Good* (*τὸ ἀγαθόν*), the *True* (*τὸ ἀληθινόν*) and the *beautiful* (*τὸ καλόν*) are not predicates of the *One*, what are they? According to Plotinus, the *Good* is only another name for the *One*, but in no way a predicate.<sup>8</sup> If *Brahman* is *Sat-chid-*

*ananda*, how are *sad, chiul* and *ananda* or *Truth, Consciousness* and *Bliss* related to the predicateless and partless Brahman? The Indian answer would be the same as the Plotinian, namely that these are not predicates, but merely different conceptual formulations of the same reality.

11. We came to the conclusion that there were substantial divergences between the Indian tradition and the Neoplatonic tradition in the question of what constitutes True or Transcendental knowledge. In India *paravidya* or Transcendental knowledge demands overcoming the distinction among knower, known and knowledge, or *jñata, jñeya*, and *jñana*. In the western tradition however the distinction between subject and object seems to be regarded as essential for all knowledge. Is this true? What then would be the western understanding of the logic of the infinite wherein all distinctions ought to vanish and all things ought to merge into each other as a single entity?

12. Our discussion on the relation between the *One* and the *νοῦς-ψυχή* needs to be pursued further. The notion of Emanation, if taken literally, would locate the *One* in time and space, which would make it finite. Emanation (*πρόοδος*) can at best be taken only metaphorically, to denote the relation between the *One* and the *νοῦς-ψυχή*. Obviously the *One* is not located in one point in space. It is both infinite, omnipresent and invisible. Would the procession or *πρόοδος* of the *κόσμος νοητός* or the *νοῦς* be comparable to the Indian *Samkhya* concept of the *vyakta* or manifest universe as coming forth from the unmanifest (*avyakta*)? Neither the concept of *πρόοδος* nor that of *ἐπιστροφή* or return, seem compatible with the Indian tradition as a whole. In the *Samkhya*, the relation between the manifest and the Unmanifest is not spelt out so clearly. What is recognized in both traditions is that the Manifest world of our daily experience has come forth from an Unmanifest Reality, upon which it is contingent. But the Plotinian concept of emanation finds no precise parallel in Indian thought. In Plotinus himself the concept of emanation is not philosophically clear, for emanation is undoubtedly a spatial concept, which cannot be applied to the *One* who transcends space. The analogies which Plotinus gives, like a light-source emanating light or a fragrant substance emanating fragrance, imply a source in space from which the emanation spreads around to the contiguous space. In the case of the *One*, the source is not in

space; the concept of emanation does not help the understanding in relation to the *One* and the *Muny*.

13. We had an extended discussion on the relation of any proposition to truth. Certainly propositions are not the only form in which human beings linguistically express themselves. There is always literature and poetry, and many other ways of talking. We agreed that propositions do not grasp the truth fully; this is so in Plotinus and in Indian thought. We saw how language can be used metaphorically as well as poetically, to supplement and clarify propositional expressions of truth. But do metaphors and poetry get anywhere closer to reality than propositions? Perhaps metaphors and propositions have their significance in their power to evoke inner experience in a way propositions seldom can. The perception of ultimate reality however always eludes the linguistic medium in every form. This applies also to concepts like emanation, when used as a description of the relation between the three principles of *One, νοῦς* and *ψυχή*. Emanation is a metaphor; it can illuminate us only analogically or metaphorically, not propositionally.

14. Finally, both in Neoplatonism and in Indian thought, the metaphysics is not functionally as important as the praxis of a discipline or *nidhidhyasa* which leads to enlightenment. The metaphysics both prepares for and conditions the experience; metaphysics arises out of experience as an attempt to conceptualise it. We thought it would be healthy to keep this in mind in all serious philosophical discussion. Critical philosophy's major weakness is thus overemphasis on the conceptual and the propositional, and the under-emphasis on discipline or *katharsis*.

We concluded that the only option open to us was to begin planning for another Seminar or conference, in India, with wider participation, on The Neoplatonist and Indian Traditions (not just thought, but including praxis or spiritual disciplines, particularly the Yogic and Tantric traditions) in the near future, with special reference to *Theourgia* and Tantrism. Perhaps we should use one of the Himalayan Ashrams as the venue, and also practice some of these disciplines during the Seminar.

Plato, Neoplatonism and Their  
Parallel Indian Ideas

D. P. Chattopadhyaya

Fashions and faith change. Languages and ways of doing philosophy are not constant either. But certain fundamental questions of life appear, disappear and reappear in different forms. If one can raise one's vision above the prevailing currents of Analytic Philosophy, Philosophy of Science and Philosophy of Language, or at least if one can see through the issues dealt with in these contemporary areas of philosophy, one can realize the importance of the largely neglected fundamental questions, tackled by great thinkers like Plato, Aristotle, Plotinus, Aquinas and St. Anselm.

How are Essences and Instances related? How is the relation between Good and Evil to be understood? How does One become Many? How are Being and Becoming, Time and Eternity related to each other? It is interesting to recall that none of these questions is peculiar to one particular culture, form of life or system of philosophy. Their trans-cultural or pervasive presence is itself an intriguing philosophical question. How do you account for the fact that in India, Europe and elsewhere, old, new and renewable answers have been and still are being raised in the course of tackling these questions?

What is there in Essence which makes its self-instantiation possible? Is it intensive or extensive or both? Briefly speaking, the Platonist finds an aptitude for, or propensity to, instantiation in the eternal *Ideas*. Sometimes this attitude has been described as an excess of fulfillment or, metaphorically speaking, Divine Envy. All ideas are systematically subordinate to Goodness and Intelligibility. Unity or oneness of Good finds itself as a system of all unities through an eternal Demiurgic vision which articulates itself in all knowing instantial minds. God as Good realizes and reviews Itself in and through all things and beings. Plato sees all Ideas as patterns of Numbers and these patterns are

endlessly and hierarchically replicated in all existent patterns, empirical as well as transcendental.

It will not be out of place here to recall that the Unity of Brahman, referred to in the Vedas, expresses itself as *Ria* and *Satya* in the patterned or law-governed multiplicity of the world. This expression is due to the *Ananda-Sakti* or Brahman itself. And this vedic view has a distinct Platonic ring to it. The relation between the One and the Many conceived in the original Samkhya, attributed to Kapila (not Isvarakrsna's *Sankhyakarika*), and the Vedantic theories developed later on are also insightful exercises purporting to explain the relation between the two spheres of reality and often in terms of a mystic theory of Numbers associated with Pythagoreanism.

Aristotle, Plato's disciple and a dissident Platonist, third-century Neoplatonist Plotinus and his fifth-century successor Proclus developed, in the main, Platonism faithfully, and at places interpreted it critically and creatively in such a manner that the influence of Platonism, thanks to their hermeneutic reconstruction, found its way into Jewish, Christian and Islamic theology and philosophy. The ideas of St. Augustine and Aquinas were largely Platonic, though the latter claimed Aristotle as his chief mentor. The Renaissance Platonism of the Florentine Academy, the Platonism of Seventeenth-century Cambridge Platonists, the dualism of Descartes, the Transcendentalism of Kant, and the Dialectical Idealism of Hegel are all different variations on Platonic themes, written and unwritten.

If the European history of philosophical and religious ideas is thus rooted in the Platonic tradition, those who are fairly familiar with the philosophies and religions of India can see that basic European ideas, orthodox as well as heterodox, are seminally found in the Vedas, Upavedas and the Vedangas. These generalizations are not intended in any way to ignore the significant differences between various trends of thought and forms of religion.

Every culture, like every personality, has in it differing, at times even opposite, traits. The complexity of a system of thought, particularly of interactive sub-cultures within it, with the simultaneous presence of distinct types of theories and practices within the same country and in the same age do not negate their underlying affinity or family resemblance. Different ways of thinking and forms of feeling are mutually supportive and influential, positively or negatively. For example, though Jainism and

Buddhism are opposed to the authority of the Vedas in very many ways, the insightful scholars of Indian philosophies and religions have not failed to detect their interconnections. Even Indian Islamic culture which is regarded by some as alien in character, has absorbed much of, and contributed creatively to, what we call the composite culture of India.

## II

From general truths of Platonism let me now try to indicate briefly some of its specifics. Both in the tradition of Platonism and that of India, veritable knowledge, as distinguished from unreliable opinion, is said to be due to discernible subsumption of peculiar instances under a truly universal content. In both traditions Intuitive Reason or *nous* is given more cognitive importance than sense-perception as a source of knowledge or validating criterion.

Aristotle, never completely reconciled to the Platonic theory of the relation between the intelligible and the sensible has expressed his questionings and difficulties in his *Metaphysics*. Related to these difficulties is the Aristotelian account of a substantial notion of matter and ■ quasi-materialistic conception of mind. It seems that Aristotle could not accept Plato's conception of space and the related conceptions of individuation and instantiation. It is in terms of his view of teleology, not by a Demiurgic vision, that Aristotle offers a theory of upgraded individuality of being, which, being downgraded universality, is related to the materiality of matter and to the immaterial Goodness of Prime Idea or Highest Form.

Plotinus, together with some Neoplatonists like Eudorus, Plutarch and Numenius, tried to reconcile the positive elements of the teachings of Plato and Aristotle. Their central thesis rests on three principles of Being:

1. Super-essential, Super-intelligible One or Good;
2. the Timeless Archetypal Mind or Intellect; and
3. the World-Soul, working as ■ mediatory principle between the ideas and unifying them as perfect patterns and the changeable world of instances or particulars.

Knowledge of the particulars demands of the knowing subjects that these objects have to be viewed under their appropriate patterns or

forms. Mind or Nous is said by Plotinus to be a unity of all things together, and yet not altogether, since each has a separate potency of its own. This proposition echoes the spirit of Plato's *Theaetetus* and that of Aristotle's *De Anima*. The World-Soul, informed by the Supreme One, informs everything in space. And this descent of One in Many is claimed to be *logically necessary*. How? Whatever is perceived as actual is stated to be due to its *possibility* and the *possibility* itself is grounded on some *necessity*. Equally important is the Neoplatonic theory of *logical interpenetration*. Everything is simultaneously something primarily and everything else subsidiarily. The elements of this theory of enormous consequence are culled from *Parmenides* and the *Sophist*. The same theory is found in the Upanishadic Principle that every Self is present in every other self; every other self is present in this self; and all selves are identical or One at bottom.

Another variation of this thesis is to be found in the intramonadicity, intermodicity and the monadic unity, *monadus monadum*, of Leibniz. The movements between One and the Many may be viewed in two related ways:

1. vertical ascent-descent, and
2. horizontal expansion and contraction.

Sometimes this truth is metaphorically expressed in terms of mutual mirrorism and according to the laws of continuity and symmetry.

That the insights of Neoplatonism are not exclusive to the non-religious philosophical is evident in Judaism, Christianity and Islam. The God of all these major religions is recognized as infinitely Perfect or Good, lifted above the world of instances, and the latter depending absolutely on God. Such a notion of God is to be understood in terms of *Being* not *having*, of the essential God and Goodness of this instantial world. The transformation of the tribal Jehovah into the Jewish God is illustrative of the above Platonic principle. The transformation of the tribal deities into One Circle of Kaba Masjid of Mecca may also be viewed in a similar way. God is taken as the most generic of *Being* which shapes the world through the Divine Word or Logos.

The Vedic parallel to this Principle is that Ultimate Reality is the Master Sound (*Nadabrahma*) which individuates itself not only in all distinct audibles but also in all distinct sensibilia. The best available systematization of this view is found in the *Sphotavada* of Bhatṛhari and

in the *Sabdadvaitavada* of Mandana Misra. Of course the pre-systematic elements of this view are available in many places of the Vedic literature and grammar. Perhaps it is needless to add here that when I speak of doctrinal parallelism between Neoplatonism on the one hand and Indian thought on the other, the same must not be understood literally but only conceptually. At the same time I must add that these and numerous other parallelisms are not merely doctrinal but also argumental in many cases, at least in their intention.

### III

Platonic influence on Christianity is clear from Christian philosophers like Clement, Origen, Gregory and Augustine who flourished in the Third and Fourth centuries. They formulate, understandably in different ways, the already referred to three First Principles of Being as the Trinitarian Unity of Goodness as God, Logos and Matter in its two forms, degenerate and regenerate, descent of God in Matter and ascent of Matter towards God.

Even more strongly Platonism is defended by Denis or Dionysius the Pseudo-Areopagite in the fifth-century. He speaks of Transcendent Primal Unity as beyond the realm of Being and Knowledge and as having nothing to do with Truth, Unity, Godhead, Sonship or Fatherhood. Yet curiously enough, this Transcendent Unity is nameable in very many ways as Good, Beautiful, Luminous, Adorable, etc. The nameability of the Primal Unity is to be understood only in relation to its perception by human beings. In the context of Unity-cum-Humanity one can even speak of mutually contradictory names of the Divine such as "Infinitely Great" and also "Infinitely Small".

In the Upanishads of India one comes across parallel conceptions. Philosophers speak of contradictory aspects of the Supreme Reality. It is said to be nameable and yet also nameless, sensible and yet beyond the reach of all senses, greater than the greatest and, also, smaller than the smallest, static and dynamic at the same time, proximate and distant simultaneously, and *vak* (speech) and yet beyond the ken of speech. The seemingly incompatible names and designations of God or Supreme Reality are indicative of its plenitude of Being which makes it unavailable in its fullness under any category, name or speech.

The fullness of the glory or the perfection of God makes it

difficult for us to think that it does *not* exist within the sweep of space, time and causality and in the mosaic of the ephemeral world. Anselm's ontological proof of God's existence, though well-intended, is ill-formulated in the sense that it takes existence in the instantial sense. It is this weakness of his formulation which has been fully exploited by the pro-empiricist Kant when he tries to refute Anselm's argument by pointing out the important distinction between the *idea* of existence and *existence* as such. It is easy to criticize Anselm because of his pro-Platonic dualistic background. But can Kant himself be fully absolved of this charge? What sustains his proclaimed affinity, not full-blooded unity, between the causal Nature on the one hand, and the transcendental Good and Beauty on the other? What is this *telos* which is credited with the capacity to embrace both the empirical and the transcendental?

It is with relative ease that we can criticize Anselm and Kant for their account of the relation between the World of Ideas and the World of Instances of those very ideas and their experiences in us. But called upon to explain this relation to our scientific as well as spiritual satisfaction, we encounter profound difficulties. If perfect God or Supreme Reality is thought to be incapable of self-instantiation, one can think of another superior God or superior Reality to whom or to which this absent ability could be attributed. But this attribution is itself hypothetical. Because we can never be cognitively sure whether this attributed ability or capacity is in the Highest Reality itself or it is due to will or thought, or both, of human beings themselves. Secondly, if God is thought to be incapable of self-instantiation in the realm of existence or experience, the ontological necessity of postulating another God lands us in the logical fallacy of infinite regress.

The logical or critical scrutiny to which the human thought process is subjected is itself a human conceptual contrivance and, what is even more disturbing, the particular logic used is not unique. Unless the human logic of noncontradiction is accepted as the unique articulation of the Logos itself, the logic of grasping Highest Reality and that of grasping the anaemic ontology of the "shadowy" empirical world cannot be claimed to be one and the same. About the unitarian logic itself grave doubts have been expressed by ancient mystic thinkers like Pythagoras, Plato, all the way down to Sri Aurobindo of our own time. Sri Aurobindo is never tired of reminding us that the logic of the Finite is magic in the Infinite. Interestingly enough, neither the so-called mystic nor the so-called

rigorous analytic philosophers can totally dispense with some form of logic, whether, two-valued, three-valued or many-valued.

Both Aquinas and much later Leibniz went deeply into the questions raised above. Unlike Anselm, Aquinas does not take his cues from the Aristotelean argument for the Unmoved Mover to prove the existence of God. Without being vulnerable to the logical fallacy of infinite regress in the quest of God (higher than whom there is no other God) as Supreme Reality, Aquinas maintains that God is essentially *simple* through and through. This simplicity is nothing but the complete identity of God's existence with His essence. God knows no difference native to its own nature, distinction between *what* is what it is, and *that* it is. Aquinas's account of the empirical world is offered in terms of *participation*. Finite and created objects are what they are by virtue of their participation in God's Nature. God's own Nature is *essential*, i.e., has nothing in it requiring it to be instantiated in the world of objects. The world of objects, unlike God's essential Nature, is said to be *accidental*. Yet the realm of Essence and that of Accidents are united and remain so for ever because of God's Goodness bringing about this coincidence between the said two realms, two from the human perspective, but one and the same from the Divine perspective. Strictly speaking, the human perspective, marked by experiential or instantial plurality, is not different from, or external to, God's simple nature.

#### IV

This line of argument leads one to the view that the Natural World studied in the empirical and experimental sciences has a unity of its own. Natural kinds are not only mutually harmonious but also reciprocally supportive. Bacon takes enormous pains to show that the laws of Nature are there *in* Nature to be discovered by the knowing mind. The reason why our minds are capable of inductive learning and leaping is that there is an orderliness, partly visible and partly invisible, pervading the whole Nature. The reason why laws of Nature form a unity of their own is due to the fact that nature itself is unitarian in its structure. But this structure cannot be easily discovered by the human mind because of its uncritical subjection to some idols or idle dogmas. By contrast, the Divine mind is free from all blemishes or imperfections and informs the whole of Nature.

Critical of the Aristotelian syllogistic, Bacon defends empirical and experimental induction as the *Organon* to be used for delving into the depths of Natural truths. Instances of Natural laws have to be viewed in their mutual relation and not in isolation. Certainly Bacon was not a Platonist in the received sense of the term but his insistence that the existence of orderliness in Nature is to be discovered by inductive exploration and expansion bears the unmistakable stamp of Platonism.

In Leibniz, another scientific philosopher, the influence of Platonism, mediated by Scholasticism, is clear and distinct. In this theory of harmony, simplicity and universality of knowledge, one can easily discern Platonic concerns. First, he tries to resolve by definition every complex term into simple or indefinable terms. Such indefinable terms are represented by mathematical symbols or logical constants. Secondly, he takes pains to show that the distinction between necessary propositions and contingent propositions, truths of reason and truths of fact, is due to the limitations under which human knowledge works, and that from God's point of view this distinction is not there. The Unity of Divine vision comprehends all kinds of truths, scientific, jurisprudential and even theological in a deductive form and which is claimed to be expressible in a universal language, *universal mathesis*. Thirdly, the ideal of harmony is not epistemological in its origin and character. It is monadological or ontological with its moral and theological implications. He speaks not only of the possible union of all Christian *princes* in a future ideal political order, but also of all *beings*, animate and inanimate, as warranted by the Law of Sufficient Reason. Leibniz's theory of "the best of all possible worlds" is developed under the aspect of God's goodness and all-knowing capacity. Even the evil that we come across in our life is said to be compossible with the Leibnizian view of the best of all possible worlds. God is not forced (none to force him from within or without) to create the best or the unique world, but only the best *possible* one, otherwise God's omnipotence and free choice are compromised by implication.

Unlike Newton, Leibniz maintains that space and time are relative, not absolute, and God's *sensorium*, forms of sense-perception of all things in their succession and coexistence. This idea of externality of things to space and time, is borrowed, on his own admission, from the Schoolmen influenced by Plato. Of the phenomenality of space and time he is persuaded. The shadowy or obscure character of inanimate or

material things is due to their situatedness within the framework of space and time. His formulation of the relation between the phenomenal world and its transcendental creator is sure to remind one of the Platonic cave and the distorted shadows cast on its walls by external light. It appears that Leibniz did not succeed in satisfactorily clarifying the relation between the subjective and phenomenal forms of space and time. How the subjective forms of space and time and the things in the objective space and time are related and how both stand related under the aspect of Divinity are some of the questions which have been left unexplored by Leibniz.

It fell to Kant, deeply influenced by Newton, to explain the unity of phenomena available in sensibility through its *subjective* forms of space and time and their affiliation to the Supreme Synthetic and Transcendental Principle of Apperceptive Unity. Kant's subjectivist view of space and time is largely due to Leibniz. Also the unity of *sensibilia* in space and time is rooted in our Transcendental Self and as mediated by two other levels of Unity, of Imagination and of Understanding. Without the transcendental rootedness of the Unity of all sensible objects, the inter-subjective and cognitive shareability of the law-governed world of science remains inexplicable. In brief, the Unity of whatever object in space and time, in existence and succession, could not be known alike and by all the knowing beings without postulating the Apperceptive and Synthetic Unity of the Transcendental Self, ■ functional presence of God in humankind.

Kant's own interpretation of Plato's Idea makes it clear that he, like Plato, concedes the necessity of recognizing a Supreme Transcendental Principle of Unity for both cognitive and ethical purposes. Also for comprehension of change or flux both Plato and Kant maintain that the transcendental approach is absolutely called for. Without ■ transcendental principle like "I" or "I think" what is meant by such expressions as "I imagine" and "I understand" remain unintelligible. Thus Kant, echoing Platonism, has tried to reconcile the unity of the empirical and the transcendental, the scientific and the metaphysical.

## V

In this concluding section I will briefly refer to two Indian types of thought which may appear Platonic or Kantian in their aim and character but were developed independently in India. But, as we know, the

fundamental questions of philosophy and their attempted answers in different times and places, are bound to exhibit a striking similarity.

Both in Vedanta and Samkhya, freedom from error and knowledge as freedom are commended as the supreme *purusartha* or end of life. Pain and suffering associated with the principles of materiality of different ascending grades, *bhutadi*, are obstructive of knowledge and freedom unless they are sublated by appropriate spiritual exercises and the resulting identification with Brahman (in Vedanta) and the reflective discernment (in Samkhya). Reflection itself is a freeing process, both conatively and cognitively, and recognizes the dualism between subject and object. But the being of the object is what it is only in reference to the subject. This reference is expressive of an unconscious teleology in Samkhya. The subject or self as body has its two aspects, material and mental. The mental body in its subtle form may survive the dissolution of the material body. Both aspects of the body are informed of an unconscious teleology through *bhava*. The subjective function of referring to what is *bhogyā* (the objective) expresses its teleological rootedness.

The teleological character of *buddhi* (intellect), an evolute of *Prakṛti*, itself is evident in its twin manifestations, causal and non-causal. The world of experience in its relation to the perceiving body is the content of thought. The world as *bhogyā* (enjoyable or sufferable) is the projection of the feeling body, projection due to unmanifest *guṇas*. *Buddhi* is causal as manifestation of *Prakṛti* and non-causal in relation to its content. Emerging out of causal nature, *mahat* or *buddhi*, according to Samkhya, can assume the dignity of its non-causal or free-creative projection of the world as its content. Interestingly enough, as the confluence of the causal and the non-causal aspects of Nature, our body proves to be a sort of *tertium quid* between the lower nature (*apara prakṛti*) and the upper Nature (*para Prakṛti*). The causal body unfolds itself, projects itself and creates what is *bhogyā*, the ground of pain and joy.

The actions (*karma*) which project their effects in *bhogyā* or experienced (Nature) are manifest in real time. But the reals or evolutes of Nature are nodal in character and therefore in a way distinct from one another. Yet our intellect or *mahat* comprehends them as continuity, projective or constructive continuity. This capability of *buddhi* to see unity in the nodally discontinuous reals, i.e. distinct evolutes, shows its relatively free creative character. That subjection to spatiality and

temporality does not, rather cannot, take away the continuity of the twenty-five reals or principles (*pancavimsati tattvas*) is further indicative of the self-leaving capacity of *buddhi* from the phenomenal manifestations or sense-capacities and action capacities of the empirical world.

Of this disengagemental capacity of our *prapanca*, or world-projecting *buddhi* from its own bases, somatic sensibility, active and imaginative, has been elaborately argued by Kant in a related context. Like Kant, Samkhya draws a significant distinction between *I*, on the one hand, and *me* and *my* on the other. The body *qua* body has no cognitive capacity of its own. It is only ■ the body of the self, as embodied self, which can be credited with the capacities of knowing, enjoying, or suffering, that cognition is possible.

Again, like the Kantian dualism, Samkhya, especially pre-*Kārika* Samkhya, dualism of *Purusa-Prakṛti* lends itself to a pro-monistic, non-mechanical or, positively speaking, proteleological interpretation, not to a forced interpretation. For not only *Purusa* is consciousness but *mahat* also is often conceived in terms of intensity, not extensity, relatively free creativity and implicit teleology. The difference between *Purusa* and *Mulaprakṛti*, especially the number-based symmetry and orderliness of its evolutes, is not essential. On the contrary, they are affine, or have mutual affinity. That explains, at least partly, why *Yoga* could bring or review them together under God. The *Yoga* interpretation of Samkhya, as I see it, is not forced. It is like Hegel's reformulation of Kant's in the light of the *Third Critique*.

Of the modern philosophers who have shown commendable originality in interpreting Indian philosophical and religious thought two, i.e., Sri Aurobindo (1871-1950) and K. C. Bhattacharya (1875-1949), deserve special mention. Sri Aurobindo in his integral monism, *Purnadvaitavada*, has assimilated in a critico-creative manner the basic insights of Vedanta and Samkhya. He takes his cue from the Gita and from *Svetasvatara Upanisad*.<sup>2</sup> The ultimate Reality is there in beings indivisible and as if divided. *Purusa* and *Prakṛti* are both to be taken as eternal without beginning. But Sri Aurobindo recalls the Upanisadic truths that one must know *Maya* as *Prakṛti* and the Master of *Maya* as the Lord of All beings, both indivisible and divided. The Lord of Beings is said to be conscious in all conscious beings. But, at the same time, he is also consciousness in all inconscient things. The One...is master and in control of the many that are passive in the hands of Force-Nature (*Prakṛti*). He is

the Timeless and Time; He is Space and all that is in space; He is Causality and the cause and the effect; He is the thinker and the thought.' It is in this way that *Purnadvaitavada* tries to capture the basic insights of Samkhya in pro-Vedantic idioms. Sri Aurobindo opposes the dichotomous Samkhya construal of Purusa and *Prakrti*. I, as *purusa*, am in communion with all other Purusas under the aspect of Divinity. Nature and Self are nothing but the two aspects of the same Absolute. They form a Unity, a dim analogy of which is to be found in the embodied self. The Self in us, embedded in the symmetry of Nature, not only witnesses all that happens in and around us and all that is experienced and performed by us. In principle it is also reflectively capable of grasping that which makes this unitary consciousness possible and all other lesser unities, mental and somatic.

K. C. Bhattacharya is also not inclined to accept the Samkhya concept of *Purusa* as exclusive of *Prakrti*. He makes use of the universality aspects of Purusa when the egoity (*asmita*) lapses. At a higher stage of development the distinguishability of *purusa-samanya* lapses and thus freedom or *mukti* is realized. But, Samkhya maintains, of this *mukti* the individual as individual is not conscious. Vedanta rejects this conception of unconscious individual *mukti*. *Mukti* is associated with deindividualised consciousness. Samkhya points out that deindividualised consciousness can be attained with the lapse of *buddhi*. At this stage any talk of individual consciousness and its *mukti* makes no sense. This position appears to be very close to the Vedantic one. Both Samkhya and Vedanta thus indicate how both the illusoriness and the reality of the objective world, *Prakrti*, and its phenomena, can be accounted for. Also along the same lines is explained the possibility of disengagement of the world-bound *buddhi* and the resulting attainment of liberation.

To modern scientific ears many of the Indian ideas just mentioned may sound metaphysical and speculative in the bad sense. But some scientifically minded philosophers like B. N. Seal<sup>4</sup> and some philosophically minded scientists like P. C. Roy<sup>5</sup> and K. R. Chakravorty<sup>6</sup> have persuasively argued that these seemingly metaphysical ideas are firmly rooted in the scientific findings of earlier ages and that they are, to a certain extent, consistent with the conclusions of contemporary sciences. For lack of time I do not propose to go into these interesting details right now. But interested scholars will be well advised to look into the metaphysical ideas of the past and compare them with modern scientific

theories. This will help us understand both philosophy and science in their proper perspective and, what is more, would enable us to realize how true knowledge is basically relevant to the good life, individual, social and even universal.

The Omnipresence of Being,  
The Intellect-Intelligible Identity and the  
Undescending Part of the Soul  
An Essay on the Dispute about  
Indian Influences on Plotinus

Atsushi Sumi

The majority of leading Plotinus scholars of the twentieth century maintain that Plotinus' thought can sufficiently be characterized as an authentic unfolding of Greek philosophy, especially of Platonism. A nearly well-known exception among them is Émile Bréhier who puts forward the view that Plotinus might have been influenced by Indian thought.<sup>1</sup> Although Bréhier is not the first proponent of the possibility of Indian influences on Plotinus,<sup>2</sup> his view is very often referred to by those who attempt to undermine this possibility.

Let us review Bréhier's argument briefly.<sup>3</sup> Plotinus' notion of Intellect is ambivalent. On the one hand, Intellect is an articulated system of definite notions, which insures the possibility of having a knowledge of the world and the knowability of reality through reason. On the other hand, it is the universal being in which every distinction between subject and object comes to a complete end. This second feature, "the identity of the self with universal being," is unprecedented in Greek philosophy and must derive from elsewhere. Bréhier is thus led to look for the source of Plotinus' doctrine in the religious speculation of India, especially in Upanishads. Strictly speaking, this claim is not a thesis. Bréhier himself regards it as a hypothesis.<sup>4</sup>

One point must be noted. Bréhier quotes several passages from *Ennead* VI 4-5 for the second feature of Plotinus' conception of Intellect. He then holds that these treatises "can easily be read without any reference to Greek philosophy."<sup>5</sup> This observation compels him to say that "the question concerning the origin of these ideas then requires consideration."<sup>6</sup>

Bréhier's hypothesis was not received with favor by Plotinus scholars of this century and several negative responses to it followed. But here arises a question. Can we estimate that his position was totally undermined? Needless to say, his hypothesis cannot be sufficiently refuted by a mere claim that Plotinus' philosophy must be viewed as an authentic unfolding of Greek thought. Only a few critics directly attacked

Bréhier's argument. For instance, Jonathan Scott Lee, in his paper published in 1982, tries to undermine Bréhier's observation that the treatises VI 4-5 can be easily read without any reference to Greek philosophy.<sup>7</sup> In these treatises, according to Lee, Plotinus thematically deals with two problems, the problem raised in *Parm.* 130c4-131c11, concerning a thing's participation in the Form and the problem concerning the causal theory of Forms. Lee thus concludes that the philosophical import of VI 4-5 can only be determined in the context of the metaphysical tradition of Platonism. His attempt can be seen as a methodologically appropriate objection to Bréhier since he directly attacks the vein of Bréhier's argument.

In this paper, I try to make an objection to Bréhier's argument in a way which can be methodologically appropriate. First, the key passages which are referred to in his argument, VI 5,1,25-26, VI 5,12,16-23 and VI 5,7,1-8<sup>8</sup> and the passage quite relevant to the identity of the self with universal being, VI 4,14,16-23, are carefully analyzed. Through the text analysis, the doctrines which support Plotinus' conception of the self as a universal being are identified; they are the doctrines of the intellect-intelligible identity and of the undescending part of the soul. After that, it is clarified that Plotinus, in these doctrines, tackles the problems which are vital to the fundamental theses in Plato's theory of Forms and yet are not fully worked out in his dialogues. In summary, I would like to undermine Bréhier's view by showing that the texts highlighted in his argument must be interpreted in the context of the Platonic metaphysical tradition. Moreover, my discussion will seriously challenge Bréhier's observation of some ambivalence in Plotinus' doctrine of the Intellect, which serves as the starting point of his argument. In addition, I shall also examine whether or not Lee's objection to Bréhier is completely convincing.

I would like to touch briefly upon the scope of my argument. It is not the possibility of Indian influences on Plotinus but Bréhier's argument for that possibility that I examine in this paper. H. F. Müller, in his article published in 1914, is concerned to show the Hellenic authenticity of Plotinus without refuting the suggestion that Plotinus was influenced by Indian thought.<sup>9</sup> Wolters assesses that Müller's arguments do not count against Bréhier's hypothesis, since he does not deal with the possibility of specifically Indian influences on Plotinus.<sup>10</sup> Indeed I also do not deal with that possibility in this paper. From this, however, it does not follow that my argument does not count against Bréhier's hypothesis; for I refute his argument for the hypothesis. Nevertheless the refutation of Bréhier's hypothesis, even if it is successful, does not necessarily eliminate the general possibility of Indian influences on Plotinus.

## 1. The Omnipresence of Being

It would be unmistakable to say that the great treatise, which originally consisted of two *Ennead* treatises VI 4 and 5, thematically deals with the omnipresence of immaterial being. In VI 4,14,16-16,47, however, Plotinus slightly deviates from the main theme to the distinction between our higher and lower selves and the explanation of the descent and liberation of the soul in terms of that distinction.<sup>11</sup> After this digression, he proclaims the return to the original discussion about the omnipresence of being in 16,47-48.

Thus, in the beginning of VI 5,1 Plotinus resumes his discussion about the omnipresence of the intelligible being by appealing to the general consent of all men that the god within us is one and the same (1,1-8). This one god is the firmest principle of all that is desired by all things (1,8-14). Insofar as that which is one is led to what is really one by its desire for the good or for itself, and belonging to itself and being itself are the good to its nature, the good exists as being proper to that which is one (1,14-21). Hence the good is being and in being so that it is for each individual in himself (1,21-25). Here the passage, to which Bréhier refers, follows:

We have not, then ( $\alpha\pi\alpha$ ), departed from being, but are in it, nor has it departed from us: so ( $\alpha\pi\alpha$ ) all beings are one (1,25-26, tr. A. H. Armstrong, adapted by A. Sumi).

Bréhier takes this passage with 7,4-8 and regards them as Plotinus' expression of an immediate intuition or experience of the unity of being.<sup>12</sup>

Bréhier's reference to the above passage is inappropriate, because it cannot be a textual warrant for the identity of ourselves with the universal being or the intelligible whole. In VI 5,7,4-8, on the one hand, Plotinus focuses on the true self that goes back to real being (7,1), the Form of Man (6,11-12) or pure souls and intellect united with the whole of real being (VI 4,14,19-20). On the other hand, the omission of the subject of  $\alpha\pi\epsilon\sigma\tau\eta\mu\epsilon\nu$  and  $\epsilon\sigma\tau\eta\mu\epsilon\nu$  in VI 5,1,25 would suggest that Plotinus here does not deal with our higher self: the hidden  $\eta\mu\epsilon\iota\varsigma$  in the present text picks up  $\eta\mu\epsilon\iota\varsigma$  in 1,3 and is simply editorial. In the present passage, therefore, he neither establishes the identity of ourselves with the noetic world nor describes an experience of that identity.<sup>13</sup>

In the context of the passage above, Plotinus thematically considers the omnipresence of the intelligible whole. The basic features of his doctrine of the omnipresence of being are definitely Platonic. First

of all, it is necessary to understand what Plotinus means exactly by the omnipresence of being. In VI 4,2,1-6 he first distinguishes the true All or the intelligible world and its imitation or the sensible world and then ascribes the latter's being situated in the former to the causal dependence of the latter on the former. We are elsewhere told that the problem concerning the omnipresence of one and the same being is tantamount to the problem of how each of many sensible things is not without share in the same being (7,1-3). The omnipresence of being thus primarily represents the causal relation between the intelligible and the sensible worlds. This causal relation is described in two sorts of terminology, participation and paradeigmatism. In the first place, the sensible world is said to participate in the intelligible world (2,18; 8,10-11; 13,5-6).<sup>14</sup> In the second place, the causal relation must properly be compared to the relation between the original and its image as it occurs in pools or mirrors (9,37-10,17). Moreover, Plotinus holds that the causal relation must not compromise the immutability of the intelligible being. The real being is not affected by the participation of material things in it (8,10-12).<sup>15</sup> Also in the beginning of his discussion about the omnipresence of being, Plotinus distinguishes being from becoming, and stresses the unchangeability of being (VI 5,2,12-16; 3,1ff.).

Plotinus' stance in dealing with the omnipresence of being, as shown above, unmistakably conforms to the essential features of Plato's metaphysics. Needless to say, the distinction between constant being and incessant becoming forms the fundamental scheme of Plato's metaphysics in the middle and late periods of his writing.<sup>16</sup> The unchangeability of being or the Form, distinguished from the process of becoming, is hence maintained consistently through the middle and late periods.<sup>17</sup> It must be considered the basic thesis in the theory of Forms,<sup>18</sup> because the denial of the existence of the immutable Forms, according to Plato, results in the destruction of the possibility, not only of philosophy, but of all discourse.<sup>19</sup> Mainly in the middle dialogues, the causal role of the Form is often described as a thing's participation in the Form. For the causal role of the Form and its immutability to be consistent, Plato defines the minimum requirement for the way of participation: "all other beautiful things partake of (μετέχοντα) that Beauty in such a way that, while other things become and perish, that Beauty neither increases nor decreases in the least, nor is acted upon at all (μηδὲ πάσχειν μηδὲν)" (*Symp.* 211b2-5).<sup>20</sup> In his discussion about the omnipresence of being, Plotinus faithfully abides by this requirement; the causal relation between the intelligibles and the sensibles must not infringe on the immutability or impassibility of the intelligible beings.

Lee maintains that Plotinus' elucidation of the omnipresence of the intelligible being can serve as a solution to the problem, raised in *Parm.* 130e4-131c11, concerning the notion of participation and thereby that the philosophical import of VI 4-5 can only be determined in the context of the Greek metaphysical tradition.<sup>21</sup> We may survey his discussion briefly. In the *Parmenides*, the problem concerning the notion of participation takes the form of a dilemma: either the Form as a whole is in each of many sensible particulars that partake of it, in which case the Form will be separate from itself (131a4-b2), or only a part of the Form is in each of the sensible particulars, in which case the Form will be divisible (131c5-11). The metaphor of the day proposed by Socrates (131b3-6), though not pursued in the *Parmenides*, suggests a way in which the dilemma can be avoided. In the first place, Socrates' suggestion opens up the possibility of an escape from the dilemma, involving the acceptance of the first horn of the dilemma together with a denial of the Form's being separate from itself. In the second place, the metaphor of the day challenges the propriety of a conception of the relation between the Form and sensible particulars as an ordinary relation between a whole and its parts and provides a means by which the Form-sensible relation can be appropriately conceived. In the spirit of Socrates' metaphor, Plotinus replies to the problem in the *Parmenides* by accepting the first horn of the dilemma with the refusal of its consequence that the Form will be separate from itself. Plotinus' discussion slightly diverges from the interlocution in the *Parmenides* since the former concerns the relation between the intelligible world as a whole and the sensible world, and the latter the relation between the individual Forms and sensible particulars. But Lee regards this difference as merely one of emphasis. Plotinus' responses to the problem in the *Parmenides* are found in VI 4,8,2-45, VI 4,13,6-26 and VI 5,3,1-21. Lee focuses on the third passage as the key text. In VI 5,3,1-21, Plotinus gives a detailed account of the nature of the intelligible world. The Form's divisibility entailed in the second horn of the dilemma is inconsistent with the essential character of the intelligible being. The intelligible world must in its nature remain an integral whole and thereby participation requires the existence of the same thing everywhere, that is, the omnipresence of being. The problem in the *Parmenides* thus stems from Parmenides' failure to understand the nature of being. Lee, however, wonders how VI 5,3 serves as an argued response to the problem concerning participation and simply points out that in that passage Plotinus is acting on "the principle that the best defense is attack."

Lee's argument is not cogent enough on several points. It is difficult to think that Plotinus' doctrine of the omnipresence of being

serves as a solution to the problem concerning participation in the *Parmenides*.

In the first place, Lee is not aware that the first horn of the dilemma is not valid for Plato's own theory of Forms and therefore that the metaphor of the day does not hint at any real possibility of avoiding the dilemma. Parmenides' objection in the first horn of the dilemma violates Plato's own formula of a thing's participation in the Form. In *Parm.* 130b2-4 Parmenides asks:

Have you yourself drawn this distinction you speak of and separated apart on the one side forms themselves and on the other the things that share in (*μετέχοντα*) them? Do you believe that there is such a thing as likeness itself (*ὁμότης*) apart from likeness that we possess (*ἔχομεν*)...? (tr. F. M. Cornford).

To this question Socrates replies affirmatively (b6). In the above passage, participation (*μετέχειν*) is applied to the relation between the Form and the sensible particular, while possession (*ἔχειν*) is applied to the relation between the particular thing and the immanent character.<sup>22</sup> Once it is seen that εἶναι ἐν (131a8) is a cognate of ἔχειν in Plato's theory of Forms,<sup>23</sup> it turns out that Parmenides' objection in the first horn of the dilemma misinterprets participation in terms of εἶναι ἐν εἶναι ἐντι.<sup>24</sup> This misinterpretation causes the confusion between the separate Form and its immanent character.<sup>25</sup> This confusion further entails the Form's being separate from itself, insofar as it has been established in 130b4 that the Form itself is separate from its immanent character.<sup>26</sup> The consequence of the first horn of the dilemma, that the Form is separate from itself, precisely means that the Form loses its own ontological status as an immutable Form when it is inadvertently and confusedly identified with its immanent character. This entailed identification finally subjects the constant Form to becoming and perishing and so infringes upon the minimum requirement for the way of participation, as stated in *Symp.* 211b2-5, that the sensible particulars participate in the Form while it remains totally unchangeable. As several scholars point out, the first horn of the dilemma rests on the confusion of two idioms, *μετέχειν* and *εἶναι ἐν* or the misconstruction of participation as being-in.<sup>27</sup> Insofar as the first horn is itself invalid for Plato's own theory of Forms, neither Socrates in the dialogue nor Plotinus must be forced to accept it. Thus seen, the metaphor of the day does not suggest any possibility of avoiding the dilemma. Also in the metaphor, what is worse, each of the Forms is said to be in all the sensible particulars (*ἕκαστον τῶν εἰδῶν ἐν πᾶσιν. εἴη*, 131b5-6). The metaphor is not free from the confusion and

misconstruction in the first horn of the dilemma, so that it cannot be a step in the right direction towards the avoidance of the dilemma.<sup>28</sup>

In the second place, Lee confuses omnipresence and immanence. According to him, Plotinus accepts the first horn of the dilemma that the Form as a whole is in each of the sensible particulars that partake of it, with the denial of the consequence that the Form will be separate from itself.<sup>29</sup> Attempting to establish that participation requires the omnipresence of being as an integral whole, Lee refers to VI 5,3,10: "(the real being) is in many things (*ἐν πολλοῖς*) at once, existing at the same time as one whole with itself."<sup>30</sup> From these points, he seems to take omnipresence as almost synonymous with immanence. But Plotinus himself does not say that the intelligible being is in many sensible things. Let us glance at VI 5,3,7-15, where he develops the immutability of the intelligible being:

But if real being is going to be in a state of freedom from affection, it will not be in something else (*οὐκ ἐν ἄλλῳ*). If, therefore, without departing from itself or being divided into parts or itself undergoing any change, it is in many things at once, existing at the same time as one whole with itself, then, being the same everywhere, it will have an existence in many things: but (*δέ*) this is being on its own and, again, not being on its own. It remains, then (*τοίνυν*), to say that it is itself in nothing (*ἐν οὐδενί*), but the other things participate in it, all those which are able to be present to it and insofar as they are able to be present to it. (tr. A. H. Armstrong, adapted by A. Sumi).

Nowhere in the above passage does Plotinus say that real being is in sensible objects. Rather, he holds that real being, in order to be always itself and not to stand apart from itself (lines 3-4), is in nothing.<sup>31</sup> The immanence of the intelligible being in sensible objects is definitely denied. This denial would clearly indicate that Plotinus does not accept the first horn of the dilemma in the *Parmenides*, where the Form as a whole is said to be in each of many sensible particulars that partake of it. Insofar as he does not accept the first horn, VI 5,3 cannot be considered a chapter dealing with his endeavor to escape from the dilemma. Lee appears to overlook the forces of *δέ* in line 12 and *τοίνυν* in line 13. Moreover, the omnipresence of real being is not established in the above passage. Lee observes that there, Plotinus replies to Parmenides' objection in *Parm.* 131a4-b2 by showing that the integral omnipresence of being is a logical consequence of the nature of being.<sup>32</sup> This observation rests on Lee's confusion between omnipresence and

immanence and his unawareness of the fact that Plotinus in the above passage rejects the immanence of real being in sensible things.<sup>31</sup>

In the third place, Lee does not succeed in explaining how Plotinus' elucidation of the intelligible world as a whole in VI 5,3,1-8 is relevant to the problem in the *Parmenides*. On the one hand, Plotinus' discussion in VI 4-5 concerns the relation between the intelligible world as a whole and the sensible world. On the other hand, Plato's discussion in the *Parmenides* concerns the relation between the individual Form and sensible particulars. Lee is aware of this difference.<sup>34</sup> He regards this difference as "merely one of emphasis" and explains the reason as follows: "the characterization of the participation relation with respect to one *eidos* ought to be applicable to that relation with respect to all *eide* (i.e., to the intelligible world as a whole)."<sup>35</sup>

It is indeed true that the characterization of the participation relation with respect to one Form is applicable to that relation with respect to any other individual Forms. But this fact does not necessarily insure that the characterization of the participation relation with respect to one Form is applicable to that relation with respect to the intelligible world as a whole.<sup>36</sup> Furthermore, Lee points out that Plotinus' claim of the indivisibility of true being in VI 5,3,1-8 dismisses the second horn of the dilemma, in which a thing participates in a part of the Form.<sup>37</sup> He then summarizes Plotinus' claim: "Hence, participation cannot be explained in terms of the apportionment of parts of the intelligible world to sensible particulars."<sup>38</sup> It is indeed correct to say that the Plotinian intelligible world must not be divided and apportioned to sensible particulars. But we cannot apply the same rule to the indivisibility of the single Form and the intelligible world as a complex whole.<sup>39</sup> Nevertheless Lee appears to rest on the assumption that the indivisibility of the intelligible world as a whole is applicable to the problem concerning the indivisibility of the single Form.

Finally, Lee does not succeed in explaining how a clarification of the nature of the intelligible being can be an appropriate response to the problem concerning participation. As already noted, the crux of the problem is how it is possible to conceive the way of the thing's participation in the Form, the way which does not infringe upon the fundamental thesis in the theory of Forms, namely the Forms' immutability. Hence, the reply to the problem by arguing from the nature of real being commits a *petitio principii*. Lee's unawareness of this fact stems from his unawareness that participation is illegitimately interpreted in terms of being-in in the first horn of the dilemma. The problem in the *Parmenides* cannot be sufficiently solved by the acceptance of either horn of the dilemma.<sup>40</sup>

In conclusion, VI 5,1,25-26, to which Bréhier refers, cannot be a textual warrant for Plotinus' expression of an immediate intuition of the unity of being or his identification of the self with the intelligible whole. The passage lies in the context dealing with the omnipresence of real being. Lee tries to reconstruct Plotinus' possible response to the problem concerning participation in the *Parmenides* from his account of the nature of the intelligible being, from which the omnipresence of that being results. But this attempt is not successful. Nevertheless, the omnipresence of true being for Plotinus primarily means the causal dependence of the sensible world upon the intelligible, which forms the basic scheme of Plato's metaphysics. Furthermore, Plotinus defends the fundamental thesis in Plato's theory of Forms, namely the Forms' immutability, by making the notion of omnipresence distinct from immanence.

## II. The Identity of Self with the Intelligible Whole

As already mentioned, Bréhier's hypothesis of Indian influence on Plotinus is based on his observation that the view of the identity of the self with universal being is unprecedented in Greek philosophy. Let us see another passage to which Bréhier refers in developing this observation:

Now it is because you approached the All and did not remain in a part of it, and you did not even say of yourself "I am just so much," but by rejecting the "so much" you have become all yet even before this you were all; but because something else came to you after the "all" you became less by the addition: for the addition did not come from being you will add nothing to that but from non-being (VI 5,12,15-23, tr. A. H. Armstrong).

In this passage, Plotinus explicitly speaks of the identity of the self with the intelligible world. But his explanation is purely descriptive. The reason seems to be that the above passage lies in the context dealing with "a bit of encouragement (*τινὸν καὶ παραμυθίων*)" (11,5) for the solution to the problem of how the unspaced can stretch over all the body.<sup>41</sup> The identity of the self with the intelligible world seems to be based on the doctrines of the substantial identity of Intellect and intelligible objects and of the undescending part of the soul. The notion of the self as the intelligible world is satisfactorily established insofar as the self is identified either with Intellect, which comprises the totality of the intelligible objects in itself, or with the undescending part of the soul

which is very intimate to such an all-inclusive Intellect. In the subsequent discussion, I shall clarify that these doctrines are both motivated by the problems left unsolved in Plato's philosophy.<sup>42</sup>

#### A. The Identity of Intellect and the Intelligible Objects

In the third passage to which Bréhier refers, Plotinus explicates the identity of ourselves with universal being in terms of "true knowledge":

For we and what is ours go back to real being and we ascend to that real being and to the first which comes from it, and we think (*νοοῦμεν*) those beings; we do not have images or imprints of them. But if we do not, we are those beings. If then we have a part in true knowledge (*ἀληθινῆς ἐπιστήμης*), we are those; we do not apprehend them as distinct within ourselves, but we are within them. For, since the others, and not only ourselves, are those, we are all those. So then, being together with all things, we are those: so then, we are all and one (VI 5,7,1-8, tr. A. H. Armstrong, adapted by A. Sumi).

As Armstrong notes, this passage is the clearest explanation of Plotinus' statement that we are each of us the intelligible universe, as stated in III 4,3,22 and IV 7,10,34-36.<sup>43</sup> Plotinus here does not seem to distinguish fully the intelligible being and the pure soul which always remains in the noetic world (*ἐκεῖνο καὶ τὸ πρῶτον ἀπ' ἐκείνου*), (line 2). Hence it is adumbrated that *νοεῖν* (line 3) is applicable to the undescending part of the soul. This point is fully considered in the next section.

In the above passage, "true knowledge," through which we are intelligible beings, means intellection, directed to those beings, which is free from images or imprints of them (line 3). According to Plotinus, an intuitive and immediate knowledge of intelligible beings is insured only by the substantial unity of Intellect and its objects. In fact, "true knowledge" elsewhere signifies the intellect-intelligible identity. In attempting to avoid the tendency to interpret the intellect-intelligible identity in terms of the Middle-Platonic view that the Forms are hypostatized by divine intellection,<sup>44</sup> Plotinus writes as follows:

But if someone were to say that "in immaterial things knowledge and the thing are the same," one must understand what is said in the sense that it (means)...that the thing itself when it is without matter is object of intellection and intellection, ...intellection in the sense that the thing

itself, being in the intelligible, is nothing else but intellect and knowledge. For the knowledge is not directed to itself, but the thing there makes the knowledge, which does not stay like the knowledge of a thing in matter, to be different: this is true knowledge (*ἀληθινὴν ἐπιστήμην*): this is not an image of the thing but the thing itself (VI 6,6,19-30, tr. A. H. Armstrong, adapted by A. Sumi).

"True knowledge" represents the unity of Intellect and the intelligible objects. Also in the above passage, "true knowledge" is said to involve no image of the knowable thing. Two passages above cited show that the identity of the self with the intelligible world is based on the substantial unity of Intellect and intelligible objects.

What is the motive for Plotinus' doctrine of the intellect-intelligible identity? What problem does he work out with this doctrine?

In V 5,1, Plotinus devotes the entire chapter to the defense of the intellect-intelligible identity.<sup>45</sup> His argument is a negative one against the claim that the intelligible objects lie outside Intellect.<sup>46</sup> According to Plotinus, the greatest absurdity of this claim is that it inescapably causes Intellect to contemplate images of its objects, but neither the objects themselves nor the truth of them, and thereby to be deceived (lines 50-61). For Intellect's infallibility to be sufficiently defended, therefore, the objects must be placed within Intellect.<sup>47</sup>

"True knowledge," which is said to be free from images of its objects in VI 5,7,1-8, is thus embodied by the intellect-intelligible identity which does not involve any image of object, making Intellect capable of attaining always the truth of its objects.

As several critics remark, the intellect-intelligible identity concerns the exigencies of intellectual knowledge compared with the character of sense knowledge and both the possibility and modality of self-knowledge.<sup>48</sup> But the motive for the conception of the intellect-intelligible unity would not be exhausted by the exigencies that have occurred in Plotinus' own system of philosophy. In concluding his argument in V 5,1, he explicitly mentions the definite position that must be defended by the intellect-intelligible unity:

But, since one must bring in knowledge and truth and watchfully preserve real beings (*τὰ ὄντα*) and the knowledge of what each thing is (*γινώσκειν οὐδ' τί ἐκαστὸν ἐστίν*) but not the knowledge of what it is like (*ποῖόν τι ἐκαστον*), since (if we only had that) we should have an image and a trace of real beings, and not possess and live with and be fused with real beings themselves (V 5,2,4-8, tr. A. H. Armstrong, adapted by A. Sumi).

Plotinus here employs Plato's distinction between τὸ ὄν or τὸ τί and τὸ ποῖόν τι (*Epist.* VII 342e7-343a1). This distinction is made among five kinds in such a way that the former corresponds to the Form itself as ὁ δὲ γινώσκων τε καὶ ἀληθῶς ἐστὶν ὄν (342b1) and the latter to a name, a definition, an image and a knowledge of that Form. "To preserve real beings and the knowledge of what each thing is" thus means to defend the existence and the complete intelligibility of the Forms. Notice that the incorrigibility of Intellect is inseparable from the complete intelligibility of the Forms. In Plato, as already seen, the denial of the existence of the immutable Forms results in the destruction of the possibility, not only of philosophy, but of all discourse (*Parm.* 135b5-c2), so that the immutability of the Forms must be regarded as the fundamental thesis in his theory of Forms. The possibility of philosophy and other significant discourse, however, cannot be safeguarded solely by the positing of immutable Forms. Plato himself seems to have been aware of this point:

The result is that the hearer is perplexed and inclined either to question the Forms' existence, or to contend that, even if they do exist, they must certainly be unknowable (ἄγνοστα) by our human nature (*Parm.* 135a3-5, tr. F. M. Cornford, adapted by A. Sumi).

Even if the existence of the immutable Forms is admitted, the denial of their knowability will destroy the possibility of philosophy and other discourse. Hence, the existence of the invariable Forms is the fundamental thesis and their intelligibility the second-fundamental thesis in the theory of Forms. In fact, "the friends of Forms" in the *Sophist* maintain both theses (246b7-8, 248a11-12). But Plato nowhere gives a definite account of how intellect, human or divine, is related to the Forms in the occurrence of intellection. Those philosophers who wish to defend the fundamental position of the theory of Forms cannot avoid drawing a clear picture of the intellect-intelligible relation that not only coheres with the Forms' immutability but insures their complete intelligibility.<sup>49</sup> Hence Plotinus seems to say that we need to maintain the intellect-intelligible unity to preserve not only real beings themselves, but the knowledge of what each of those real beings is.

In summary, Plotinus' notion of the self as the intelligible whole is supported by his doctrine of the intellect-intelligible identity. This doctrine is motivated by his attempt to solve the problem of what relation between Intellect and the Forms coheres with the Forms' constancy and

insures their complete knowability. This is the central problem, in Plato's theory of Forms, which has not been fully worked out by Plato himself.<sup>50</sup>

The starting point of Bréhier's argument for Indian influence on Plotinus is his observation of some ambivalence in Plotinus' doctrine of Intellect; on the one hand Intellect is an articulated system of definite notions which can be grasped through reason, on the other hand the subject is indiscriminately identified with all objects on the level of Intellect. But rather, our discussion indicates that Plotinus' doctrine is totally free from such ambivalence, because the knowability of real beings must be based on nothing other than the identity of the noetic subject and the intelligible objects. Therefore it turns out that Bréhier's argument starts from his misunderstanding of the basic features of Plotinus' doctrine of Intellect.

### B. The Undescending Part of the Soul and Intellection

As already seen, in VI 5,7,1-8 the systematic connection between the undescending part of the soul, referred to as "the first which comes from real being," and the identity of the self with the intelligible whole is not fully explained, but simply hinted at. How is the undescending part of the soul related to this identity? The following passage, which Bréhier does not adduce, clearly shows the bearing of the conception of the self as the noetic world upon the undescending part of the soul:

But we who are we? Are we that real being or that which draws near and comes to be in time? No, even before this becoming to arise we were there, men who were different, and some of us even gods, pure souls (ψυχὰι καθαφαί) and intellect united with the whole of real being; we were parts of the intelligible, not marked off or cut off but belonging to the whole; and we are not cut off even now. But now another man, wishing to exist, approached that man (VI 4,14,16-23, tr. A. H. Armstrong, adapted by A. Sumi).

Here, as does in VI 5,12,16-23, Plotinus speaks of the addition of lower self to a higher one. In the above passage, "the first which comes from real being" (VI 5,7,2) is specialized as "pure souls." From the sentence οὐδὲ γὰρ οὐδὲ νῦν ἀποτεμνόμεθα in lines 21-22, "pure souls" are identified as the highest part of the soul that does not leave the intelligible world,<sup>51</sup> the part which belongs also to individual souls.<sup>52</sup> While the undescending part of the soul is discussed by many scholars, it is sufficient for the present inquiry to point out that the cognitive activity of this part is non-discursive intellection.<sup>53</sup> In the undescending soul,

there are genuine kinds of knowledge ( $\alpha\lambda\lambda\theta\nu\omega\varsigma \epsilon\pi\iota\sigma\tau\eta\mu\alpha\iota$ ) that are each and all of the intelligible objects and have intellection within themselves (V 9,7,4-8). The undescending part of the soul is very akin to Intellect in its nature and activity.<sup>54</sup> Therefore, taking VI 4,14,16-23 together with VI 5,7,1-8, we can conclude that the identity of the self with the intelligible world is based also on the nature of the undescending part of the soul which exercises intellection and always attains "true knowledge" identical with the intelligible objects.

What bearing does the undescending soul have upon Plato's philosophy? As Blumenthal points out, the undescending soul gives an account of how men can know the Forms.<sup>55</sup> As mentioned repeatedly, the complete intelligibility of the Forms is the second-fundamental thesis in Plato's theory of Forms; the Forms must be knowable precisely "by our human nature" (*Parm.* 135a5). Intellection is one of  $\pi\alpha\theta\eta\mu\alpha\tau\alpha \epsilon\nu \tau\eta \psi\upsilon\chi\eta$   $\gamma\iota\gamma\nu\acute{o}\mu\epsilon\nu\alpha$  (*Rep.* 511d7-8). Again, "the friends of Forms" claim that we have cognitive intercourse with the Forms "by means of the soul through reflection ( $\delta\iota\alpha \lambda\omicron\gamma\iota\sigma\mu\omicron\upsilon \delta\epsilon \psi\upsilon\chi\eta$ )" (*Soph.* 248a11). Although Plato does not say that the rational part of the soul always remains in the realm of the Forms, the Plotinian undescending soul does not seem to be alien to Plato's philosophy. Plato suggests the possibility of the soul in her purity to be in perpetual contact with real being ( $\delta\epsilon\iota \mu\epsilon\tau' \epsilon\kappa\epsilon\iota\nu\omicron\nu \tau\epsilon \gamma\iota\gamma\nu\epsilon\tau\alpha\iota$ , *Phd.* 79d3).<sup>56</sup> In sum, Plotinus' theory of the undescending part of the soul certainly concerns the knowability of the Forms, the second-fundamental thesis in Plato's theory of Forms.

Lee attacks Bréhier also with regard to the weight of Plotinus' treatment of the universal soul in the treatises VI 4-5.<sup>57</sup> Lee points out a misdirection of emphasis in Bréhier's view of the main task of VI 4-5; Bréhier regards it as the elucidation of Plotinus' doctrine concerning "the relations of the individual soul to the universal Soul."<sup>58</sup> Lee notices that the doctrine of the universal soul he calls it the doctrine of monopsychism plays an especially significant role in VI 4,14-15. But he estimates that the doctrine comes up in Plotinus' analysis of eidetic causation and supposes, by referring to VI 5,9,1-13, that the doctrine is devoted to the explanation of the intersubjective accessibility of the sensible world. Lee's view, however, is not tenable. In the first place, he overlooks the context of VI 4,14. As the query in VI 4,14,16-17 indicates, the previously considered passage, VI 4,14,16-23, primarily concerns the inquiry into the true self of the human person, but does not come up in the elucidation of eidetic causation.<sup>59</sup> Again, the final sentence of the treatise (16,48) marks the divergence of Plotinus' preceding discussion from the main theme of the treatise, namely the omnipresence of real being which denotes the causal dependence of the

sensible world upon the intelligible. In the second place, it is apparently difficult to read the intersubjective accessibility of the sensible world into VI 5,9,1-13. This passage simply deals with the unity of the productive cause of the sensible realm. In light of the force of  $\tau\omicron\iota\nu\nu$  in line 13, the sentence  $\kappa\alpha\iota \pi\acute{\alpha}\sigma\alpha\iota \alpha\iota \psi\upsilon\chi\alpha\iota \tau\omicron\iota\nu\nu \mu\iota\alpha$  (lines 12-13) merely points to the unity of life on which the sensible world depends (lines 10-12) and thereby does not imply such a unity of souls that insures the intersubjective accessibility of the sensible world. In addition, Plotinus' account of the true self of the human person in VI 4,14,16-23 is not strictly monopsychic; the undescending soul is mentioned in plural ( $\psi\upsilon\chi\alpha\iota \kappa\alpha\theta\alpha\rho\alpha\iota$ , line 19). Lee points out Bréhier's failure to place the problem of monopsychism within the scope of the problem of eidetic causation and participation. As shown above, however, his argument against Bréhier is not convincing enough.

### III. Conclusion

We have critically examined Bréhier's argument for his hypothesis of Indian influence on Plotinus through the careful analysis of Plotinus' texts referred to in his argument. It has been pointed out that Plotinus' conception of the self as the intelligible whole, which Bréhier attempted to explain in terms of Indian influence on him, is supported by the doctrines that are definitely motivated by the problems concerning the basic theses in Plato's theory of Forms. We now conclude our inquiry by saying as follows.

In the first place, the passage VI 5,1,25-26, referred to by Bréhier, does not deal with the identity of the self with the intelligible world. The passage is in the section where Plotinus thematically considers the omnipresence of true being. Although Lee, arguing against Bréhier, emphasizes the Hellenic purity of Plotinus by claiming that the omnipresence of real being suggests Plotinus' response to the problem concerning participation in Plato's *Parmenides*, his attempt is not fully successful. Nevertheless the omnipresence of true being denotes the causal dependence of the sensible world upon the intelligible, which delineates the basic scheme of Plato's metaphysics. Insofar as this causal relation presupposes the separateness of the intelligible beings from the realm of becoming, which confirms the constancy of the intelligible Forms, the omnipresence of real being is inseparably linked with the fundamental thesis in Plato's theory of Forms, the immutability of the Forms.

In the second place, the identity of the self with the intelligible universe is supported by the doctrine of the intellect-intelligible identity.

The doctrine represents Plotinus' reply to the problem raised and yet unsolved in Plato's philosophy, that is, what relation between Intellect and the Forms can insure the latter's complete intelligibility. This problem precisely concerns the second fundamental thesis in Plato's theory of Forms, the complete knowability of the Forms.

Finally, the identity of the self with the intelligible cosmos is also supported by the doctrine of the undescending part of the soul which is very intimate to Intellect. The doctrine provides an explanation of how men can know the Forms and thereby safeguards the second-fundamental thesis in Plato's theory of Forms, the Forms' knowability to us.

Although our argument results in the disclosure of Plotinus' serious endeavor to defend the basic theses of Plato's theory of Forms, this result does not count against the general possibility of Indian influences on Plotinus. Wolters rightly remarks:

There is overwhelming evidence that Plotinus lived and moved in the horizon of the Greek philosophical tradition, but there is no evidence that he was a prisoner of it.<sup>50</sup>

The complete intelligibility of being, which Plotinus' doctrine of the intellect-intelligible identity puts forward, urges us to understand thoroughly the complete fact of our world by abandoning dogmatic attitude towards foreign traditions of culture and religion and then continuing untiringly our intellectual and ethical inquiry in the universal horizon. If Plotinus were to be confined in the self-closed world of Greek philosophy, the vital force of his philosophy would remain dormant. One of the remarkable features of Plotinus' philosophy as the basis of a viable *Weltanschauung* seems to me to reside in its potential openness to various cultural and religious traditions.

## Endnotes

10. A. M. Wolters. *Op.cit.*, p.298.
11. Plotinus' argument in VI 4,14,16-16,47 does not totally diverge from the central problem of the treatise. As seen in 14,1-2, the omnipresence of the indivisible life naturally raises the problem of the particularization of the soul and the difference in the soul's disposition.
12. É. Bréhier. *Op.cit.*, p.110. Bales finds Plotinus' denial of the meontological character of the One in 1,21-26. See E. F. Bales, "Plotinus' Theory of the One," in *The Structure of Being: A Neoplatonic Approach*, ed. R. B. Harris (Albany: State University of New York Press, 1982), pp.43-44. This interpretation is evidently untenable, because τὸ ὑπερθεῖν (line 20) indicated by αὐτό (line 21) does not mean the transcendent Good.
13. Bréhier observes that we are dealing with an experience, but not a rational explanation, in the present passage. Is this observation accurate? The repeated occurrence of ἄρα in 1,25-26 would rather adumbrate that a rational argument is developed in 1,24-26. The argument in 1,24-26 is elaborated on as follows:
  - (a) The good is being and in being (1,24).
  - (b) Belonging-to-itself and being-itself are the good to the nature of one being (1,18-19).
  - (c) Then the good is for each individual in himself (1,24-25) (by (a) and (b)).
  - (d) Therefore (ἄρα) we have not departed from being, but are in it, nor

has it departed from us (1,25-26) (by (a) and (c)).

(c) (b) means being-one (1,20).

(f) Therefore (ἀρα) all beings in ourselves are one (1,26) (by (c), (d) and (e)).

The above explanation shows that the passage under discussion just concerns the rational argument for the unity of being.

The objection may be made that the occurrence of ἐντῷ in 1,24 implies that "we," the subject of ἀπέστημεν and ἐσμέν is our higher self, that is, either pure soul or intellect. But this objection is not convincing enough. As already pointed out, the subject of two verbs is omitted. It would be reasonable to think that our higher self enters the scene with τὸ ἡμέτερον καὶ ἡμεῖς in 7,1.

14. See also VI 5,3,14. As we shall see, this use of terminology lacks rigidity in terms of the original use of the idiom in Plato.

15. With Henry-Schwyzler, Harder, Cilento and Armstrong, Gollwitzer's emendation πάσχοντος is read for the MSS παντός in 3,11. The emendation is justified by the force of γὰρ in 8,12.

16. *Rep.* 525b5-5, c4-6, 525c6-7, 534a2-3; *Soph.* 248b6-c2; *Tim.* 27d5-28a4, 29c3. See also *Phd.* 79c2-d7, 80b1-5; *Symp.* 211a1. With several critics, we take "the friends of Forms" of the *Sophist* as representing Plato's own theory in the middle period. See F. M. Cornford, *Plato's Theory of Knowledge* (London: Routledge & Kegan Paul, 1935; reprint ed., Indianapolis: Bobbs-Merrill, 1957), pp.243-244; W. D. Ross, *Plato's Theory of Ideas* (Oxford: Clarendon Press, 1951; reprint ed., Westport, Conn.: Greenwood Press, 1976), p.107; P. Seligman, *Being and Non-Being: An Introduction to Plato's Sophist* (The Hague: Martinus Nijhoff, 1974), p.34; R. S. Bluck, *Plato's Sophist*, ed. G. C. Neal (Manchester: Manchester University Press, 1975), p.94. For the list of various views and their proponents, see W. D. Ross, *op.cit.*, pp.105-106; G. Martin, *Platons Ideenlehre* (Berlin: Walter de Gruyter 1973), p.153. For more detailed discussion for identifying "the friends of Forms," see my dissertation "The One's Knowledge in Plotinus" (Ph.D. dissertation, Loyola University of Chicago, 1993), pp.23-29.

17. The immutability of the Forms is emphatically asserted by "the friends of Forms" in the *Sophist* (248a12). This section is regarded as the reminiscence of *Phd.* 79d5 and 80b2-3. See F. M. Cornford, *op.cit.*, p.244, note 1; H. -E. Pester, *Platons Beweise Usia* (Wiesbaden: Otto Harrassowitz, 1971), p.42. The Forms' immutability has never been abandoned up to the *Seventh Letter* (342c2-4).

18. A systematized theory of Forms is nowhere found in Plato's dialogues. By "the theory of Forms" we temporarily mean a form of insight based on the single hypothesis positing constant Forms. The fundamental hypothesis is that "there is a beautiful alone by itself (τι καλὸν αὐτὸ καθ' αὐτὸ) and a good, and a great, and so with the rest of them" (*Phd.* 100b5-7). As ἐκεῖνα τὰ πολυθρόνητα in b4-5 refers back to the Forms mentioned in the recollection argument and the

kinship argument, the locution τι καλὸν αὐτὸ καθ' αὐτὸ quite certainly implies the unchangeability of that hypothetical entity. Hence the immutability of the Forms constitutes the fundamental hypothesis, rather than a thesis, of Plato's theory of Forms.

19. *Parm.* 135b5-c2. Cornford observes that Parmenides here accepts "the fundamental thesis of Plato's theory" (*Plato and Parmenides* [London: Routledge & Kegan Paul, 1937], p.100).

20. For the impassibility of the Forms, see also *Epist.* VII 342c3. Apelt correctly associates *Symp.* 211b4-5 with the refusal, by "the friends of Forms" in *Soph.* 248d10-e1, to consider intellectual knowledge in terms of acting and being acted upon. See *Platonis Sophista recensuit Prolegomenis et Commentariis instruxit O. Apelt* (Leipzig: B. G. Teubner, 1897; reprint ed., New York: Garland, 1979), pp.151-152.

21. The following sketch of Lee's argument is based on his "Omnipresence, Participation, and Eidetic Causation in Plotinus," in R. B. Harris, *The Structure of Being: A Neoplatonic Approach*, pp.90-95.

22. In the hypothesis argument of the *Phaedo*, a perfect consistency is seen in the usage of these two idioms. See N. Fujisawa, "Ἐχειν, Μετέχειν, and Idioms of 'Paradeigmatism' in Plato's Theory of Forms," *Phronesis* 19 (1974):45. Also in *Parm.* 130e5-6, participation is understood as applying to the thing-Form relation. Some may observe that Plato inadvertently applies ἔχειν to the thing-Form relation in 130d9. But this observation is not accurate because 130d8-9 ὁ νοῦς ἐλέγχον ἐῖδὲς ἔχειν simply refers to 130d4 εἶδος...τι αὐτῶν οἰσθῆναι εἶναι.

23. For the cognate idioms of ἔχειν, see N. Fujisawa, *op.cit.*: 40; W. D. Ross, *op.cit.*, p.228. See also Aristotle, *Met.* 1023a23-25.

24. εἶναι ἐν, 131a8, b1-2; εἶναι ἐπὶ, 131b9, c3.

25. Supposing that in the present passage Parmenides takes the locution accompanied with εἶναι ἐν and εἶναι ἐπὶ in the most materialistic sense, Allen points out his confusion between a physical relation and a metaphysical relation. (*Plato's Parmenides* [Minneapolis: University of Minnesota Press, 1983], p.120). For the physical sense of εἶναι ἐν, see G. Vlastos, "The Third Man Argument in the *Parmenides*," in *Studies in Plato's Metaphysics*, ed. R. E. Allen (London: Routledge & Kegan Paul, 1965), p.256, note 1. But what Allen means by the "metaphysical relation" is not fully clear. If the metaphysical relation in question implies a transcendence, it will be totally absurd to express the metaphysical relation by εἶναι ἐν since this idiom properly implies an immanence (see W. D. Ross, *op.cit.*, p.228; N. Fujisawa, *op.cit.*: 40). The confusion between the physical relation and the metaphysical relation is only discernible as the confusion between ἔχειν or εἶναι ἐν and μετέχειν. Several critics are inclined to treat μετέχειν and its cognates as describing the Form's immanence. See W. D. Ross, *op.cit.*, pp.228-230; P. Natorp, *Platons Ideenlehre*:

*Eine Einführung in den Idealismus* (Leipzig: Dürr, 1903; reprint ed., Hamburg: Felix Meiner, 1961), pp.88, 155, 409. But, since these idioms express the relation between the sensible particular and the separate Form, we may regard them as implying the Form's transcendence. See N. Fujisawa, *op.cit.*: 40.

26. We should note that χωρίς occurs five times in 130b-d, but does not always concern the separateness between the Form and the thing partaking of it. Whereas χωρίς in 130b2, b3, c1 and d1 concerns the separateness between the Form and the thing, χωρίς in 130b4 alone concerns the separateness between the Form and its immanent character.

For the rejection of the immanence of the Forms, see *Symp.* 211a8-b1 and *Tim.* 52a3. See also R. Hackforth, *Plato's Phaedo*, translated with an Introduction and Commentary (Cambridge: Cambridge University Press, 1955), pp.143-144.

27. N. Fujisawa, *Op.cit.*: 34; H. 32. J. S. Lee, *Op.cit.*, p.94.

33. As already mentioned, the omnipresence of real being for Plotinus primarily denotes the causal dependence of the sensible world upon the intelligible. In this causal relation, that which comes after the true All is in the really existent All (VI 4,2,3-4). Again, we are told that the visible universe is, in a way, based on and resting on true All (2,10). Plotinus' position is precisely that the sensible world is in the intelligible rather than that the intelligible world is in the sensible. But VI 4,3,17-19 appears to run counter this. The passage reads:

"There is nothing, therefore, surprising in the true All's being in all things (ἐν πᾶσιν εἶναι) in this way, because it is in none of them (ἐν οὐδενί ἔσθαι) in such a way as to belong to them" (tr. A. H. Armstrong, adapted by A. Sumi).

Plotinus here does not say that the intelligible world is literally immanent in the sensibles. As οὕτως in line 18 indicates, he explains a way in which the intelligible world is present to the sensible in the preceding passage. But the text in lines 15-16 is corrupt, so that we cannot accurately know his explanation. Nevertheless it is evident that the true All is not possessed by any sensible (οὐ γινόμενον ἐκείνου, line 16). As already seen, ἔχειν is a cognate of εἶναι ἐν in

Plato. But since Plotinus rejects the possession of the true All by the sensible object, the locution ἐν πᾶσιν εἶναι in line 18 must be distinct from such locutions like ἐν πολλοῖς οὖσιν ἐνέσται in *Par.*, 131b1-2 and ἐν πᾶσιν εἶη in 135-6. We must not be misled by this locution. Plotinus explicitly states in line 12 that the true All itself is present to the sensible, being all the same separate. Therefore the above cited passage does not establish the immanence of the intelligible world in the sensible.

Lee's confusion between omnipresence and immanence is not without cause. In the metaphor of the day itself, omnipresence and immanence are not fully distinct from each other:

"[The Form would not be separate from itself] if it were like one and the same day, which is everywhere (πολλαχού) at the same time and nevertheless is not separate from itself. Suppose each Form is also in all things (ἐν πᾶσιν εἶη) at the same time as one and the same in this way (οὕτω)" (*Parm.* 131b3-6, tr. F. M. Cornford, adapted by A. Sumi).

In the metaphor of the day, omnipresence is not fully distinct from immanence. Lee might possibly be misguided by this ambiguity. Hence we can conclude that Plotinus in VI 4-5 does not faithfully follow the spirit of the metaphor of the day, but makes omnipresence distinct from immanence.

34. J. S. Lee, *Op.cit.*, p.92.

35. *Ibid.*

36. Lee refers to VI 5,3,13-14, where the things are said to participate in real being as a whole (τὰ δ' ἅλλα ἐκείνου μεταλαμβάνειν), in his reconstruction of Plotinus' response to the problem in the *Parmenides* (*op.cit.*, p.94). If the characterization of the participation relation with respect to one Form is precisely applicable to that relation with respect to the intelligible world as a whole, the things which participate in real being ought to have an immanent character of the intelligible world as a whole. But this is obviously unreasonable. Hence the use of μεταλαμβάνειν in VI 5,3,14 must be clearly distinguished from the normal use of the participation idioms in the passages where Plato deals with the Forms. Moreover, the principle of the causal theory of Forms, τὸ καλὸν τὰ καλὰ καλὰ (*Phd.* 100e2-3), on which the participation relation with respect to one Form is based, is not applicable to that relation with respect to the intelligible world as a whole.

37. J. S. Lee, *Op.cit.*, p.93.

38. *Ibid.*

39. The indivisibility of the intelligible world must be distinguished from that of the individual Form, because the former means that the intelligible world consists of many Forms and yet is indivisible (II 4,4,14-15).

40. For another attempt to reconstruct Plotinus' reply to the *Parmenides* problem concerning participation, see J. Fielder, "Plotinus' Reply to the Arguments of *Parmenides* 130a-131d," *Apeiron* 12 (1978):1-5. As does Lee, Fielder holds that

the clarification of the nature of immaterial entity leads to the solution to the problem. I do not maintain that no solution to the problem is suggested in VI 4-5. My own position is that Plotinus' possible response can be reconstructed from VI 5,8. I will leave the full explanation of my reconstruction and the examination of Fielder's view for another occasion.

41. In VI 7,40,2-5, παραμυθία, coupled with πειθώ, is contrasted with logical necessity (ἀνάγκη).

42. Bréhier takes VI 5,12,16-23 as an expression of the disappearance of an individual consciousness (*op.cit.*, p.110). Bussanich contrasts the present passage, V 8,7,32-35 and V 3,4,9-13 with III 8,11,32-38 and maintains the disappearance of human individuality and individual consciousness on the intelligible level (*The One and Its Relation to Intellect in Plotinus*, A Commentary on Selected Texts [Leiden: E. J. Brill, 1988], pp.128-129). For the opposing view, see M. Atkinson, *Plotinus: Ennead V.1, A Commentary with Translation* (Oxford: Oxford University Press, 1983), pp.104-105; G. M. Gurtler, *Plotinus: The Experience of Unity* (New York: Peter Lang, 1988), pp.63-64. But Arnou tries to reconcile the present passage with VI 4,14,17ff., where Plotinus says that we exist as particulars in the noetic world (*Le Désir de Dieu dans la Philosophie de Plotin*, 2nd ed., [Rome: Presse de l'Université Grégorienne, 1967], pp.204-208). See also H. J. Blumenthal, *Plotinus' Psychology: His Doctrines of the Embodied Soul* (The Hague: Martinus Nijhoff, 1971), pp.123-125. In this essay, I do not go into the problem concerning our status in the intelligible world, which is linked with the grand problem of whether or not Plotinus believes in Ideas of individuals.

According to Lee, in VI 5,12,19-22 Plotinus claims that the soul, which was identical with the intelligible world, becomes more of a non-entity through the addition of the self to the objects of her contemplation (*op.cit.*, p.99). I cannot see how such an interpretation is possible. The addition of "something else" (line 20) is said to be from non-being (line 22), namely sensible matter. The passage in question does not warrant the negativity of self-consciousness.

43. *Plotinus*. Text with an English Translation by A. H. Armstrong, 7 vols. (Cambridge, Mass.: Harvard University Press, 1966-88; London: William Heinemann, 1966-88), 6:340-341, note 1.

44. For a detailed discussion about Plotinus' attempt to draw the line between his own doctrine of the intellect-intelligible identity and the Middle-Platonic conception of the Form as God's νόμα, see A. Sumi, *op.cit.*, pp.124-126.

45. For the full analysis of Plotinus' argument in V 5,1, see A. Sumi, *op.cit.*, pp.103-107.

46. See M. R. Alfino, "Plotinus and the Possibility of Non-Propositional Thought," *Ancient Philosophy* 8 (1983):278.

47. This argument is prefigured in III 9,1,6-9 and reappears in V 3,5,21-26.

48. See J. Pepin, "Éléments pour une Histoire de la Relation entre l'Intelligence et l'Intelligible chez Platon et dans le Néoplatonisme," *Revue Philosophique de la France et de l'Étranger* 146 (1956):48-49; J. Bussanich, *op.cit.*, pp.91-92.

49. See A. H. Armstrong, "The Background of the Doctrine 'That the Intelligibles are not outside the Intellect,'" in *Les Sources de Plotin* (Geneva, Vancœuvres: Fondation Hardt, 1957), p.401:

"Plotinus in formulating his doctrine that the Intelligibles are in Intellect seems to me to be concerned with a question of a different sort 'What is the *relationship* of eternal intuitive thought to its object (or objects) and how is that object to be conceived?'" (Italics mine).

I do not go into details about how the intellect-intelligible unity coheres with the Forms' immutability here. For my discussion about this problem, see A. Sumi, *op.cit.*, pp.113-118, 127-128.

50. Needless to say, Plotinus' doctrine of the intellect-intelligible unity historically goes back to Aristotle's doctrine of divine Intellect. Aristotle's psychological formula of the identity of mind in activity with the object of thought, which is applied to his analysis of the internal structure of divine intellection in *Met.* 1072b14-28, has philosophical merits of insuring the infallibility of divine intellect and safeguarding its immutability. Exploiting these merits fully, Plotinus tackles the problems which remained unsolved in Plato. For the connection of Plotinus' doctrine with Aristotle, see A. Sumi, *op.cit.*, pp.73-74, 78-80.

We may briefly touch upon the philological source of Plotinus' expression ἀληθινὴ ἐπιστήμη. This expression seems to go back to the *Phaedrus* myth, which, according to his own exegesis, implicitly suggests the intellect-intelligible unity. He writes:

"... but about the knowledge there which Plato observed and said 'that which is not a knowledge different from that in which it is (οὐδ' ἥτις ἐστὶν ἄλλην ἐν ἄλλῳ),' but how is so, he left us to investigate and discover" (V 8,4,52-54, tr. A. H. Armstrong).

It is evident that οὐδ' ἥτις ἐστὶν ἄλλην ἐν ἄλλῳ is a paraphrase of ἐπιστήμην..οὐδ' ἥ ἐστὶν καὶ ἑτέρα ἐν ἑτέρῳ οὕσα ὧν ἡμεῖς νῦν ὄντων καλούμεν (*Phdr.* 247d7-e1). Notice that ἑτέρα ἐν ἑτέρῳ (d7-e1) explains ἡ γένεσις πρόσθεσιν (d7) and is contrasted with ἐν τῷ ὃ ἐστὶν ὄν (e1-2) which characterises Knowledge itself or τὸ τῆς ἀληθοῦς ἐπιστήμης γένος (c8). (Hackforth's translation of d7-e1 "knowledge that...varies with the various objects" overlooks the first ἐν in e1). Whereas there is some confrontation and heterogeneity between sense knowledge and becoming, Knowledge itself is totally harmonious with real being. In the *Phaedrus* myth, the expression τὴν ἐν τῷ ὃ ἐστὶν ὄν ὄντως ἐπιστήμην indicates at most the homogeneity and concord between Knowledge itself and real being, but not the presence of the Forms in Knowledge; for true Knowledge is simply about (περί) real being. Plotinus

further reads the unity of Knowledge or Wisdom and real being (V 8,4,47-48: 5,15-16) into the phrase οὐδ' ..έτέρα ἐν έτέρῳ. In 4,3-4, moreover, he contrasts ἐπιστήμην, οὐχ ἢ γένεσις πρόσθεσιν with ὁρῶσι τὰ πάντα...οἷς οὐσία, καὶ ἑαυτοὺς ἐν ἄλλοις. Here he takes οὐδ' ..έτέρα ἐν έτέρῳ or οὐδ' ..ἄλλην ἐν ἄλλῳ as suggesting ἑαυτοὺς ἐν ἄλλοις.

As III 9,1,14-15 insinuates, Plotinus believes that the doctrine of the intellect-intelligible unity is entertained by Plato himself. For more detailed discussion about the *locus classicus* in Plato's dialogues for Plotinus' doctrine, see A. Sumi, "Plotinus on *Phaedrus* 247D7-E1: The Platonic *Locus Classicus* of the Identity of Intellect with the Intelligible Objects," *American Catholic Philosophical Quarterly* 71 (1997): 404-420.

51. For the undescending part of the soul, see II 9,2,4-5; III 8,5,10-11; IV 8,3,1ff.; V 1,10,21-24. In V 3,9, "the most divine part of the soul" (line 1) is called "pure" (lines 18-19).

52. See IV 8,8,2-3; 8,16-18.

53. See IV 8,3,6; 8,15; V 3,9,28-29. See also IV 3,30,11-12. For intellection as the proper activity of soul, see G. M. Gurtler, *op.cit.*, pp.195-196. On the other hand, the undescending part of the soul is called τὸ λογιστικόν in III 8,5,10 and διάνοια is attributed to "the pure part of the soul" in V 3,3,11-12 (see also V 1,7,42-43 τὸ διανοούμενον). Hence Atkinson is inclined to think of the undescending soul as, in some way, a part of διάνοια (*op.cit.*, pp.61-64). Here we do not go into detail about the status of the undescending soul.

The rational soul is sometimes called "ourselves." In V 3,3,35-36, λογίζεσθαι and διάνοια are attributed to "ourselves." In I 1,7,21-22, the true man is identified with the rational soul (τῇ λογικῇ ψυχῇ). Here διάνοια, δόξα and νόησις are ascribed together to the rational soul or ourselves (lines 14-17). For the kinship between V 3,3 and I 1,7, see G. M. Gurtler, *op.cit.*, p.233.

Rist points out the difficulty in Plato's tripartite division of the soul; though the infallible νόησις and the fallible διάνοια must be clearly distinguished, they are together attributed to τὸ λογιστικόν, the highest part of the soul ("Integration and the Undescended Soul in Plotinus," *American Journal of Philology* 88 (1967): 413-414). He explains how the Plotinian undescending soul is related to the Platonic λογιστικόν as follows:

"If there were a tripartite division of the soul in Plotinus, therefore, with τὸ λογιστικόν at the top, it would be below the level of the upper soul which is eternally in contact with νοῦς in contemplation" (*op.cit.*:416).

This view is not accurate. First, the Plotinian undescending soul is endowed with the intellective function of the Platonic λογιστικόν. Second, Rist's observation of the Plotinian λογιστικόν is not fully accurate. In light of V 3,3,23ff., he regards the middle part of the soul in II 9,2,5-6 as τὸ λογιστικόν whose proper activity is διάνοια (*op.cit.*: 416). But τὸ λογιστικόν in V 3,3 is also

denominated "the pure part of the soul" (lines 11-12). Rist does not consider the fact that Plotinus sometimes calls the undescending soul τὸ λογιστικόν. Although it is true, as Rist points out, that the Platonic tripartition of the soul does not fit well with Plotinus' psychology, we should not overlook the noetic feature that the Plotinian undescending soul has inherited from the highest element of the Platonic soul.

54. This point entails the difficulty in demarcating the undescending soul from Intellect. See H. J. Blumenthal, "Nous and Soul in Plotinus: Some Problems of Demarcation," in *Plotino e il Neoplatonismo in Oriente e in Occidente* (Rome: Accademia Nazionale dei Lincei, 1974), pp.203-219.

55. H. J. Blumenthal, "Soul, World-Soul, and Individual Soul in Plotinus," in *Le Néoplatonisme* (Paris: Centre National de la Recherche Scientifique, 1971), p.62, note 1.

56. In the recollection argument, Plato characterizes the Forms as "what was formerly ours" (*Phd.* 76e1-2), implying that they were known by us before our birth. From this characterization, however, we cannot conclude that the soul's prenatal knowledge of the Forms attains her identity with them, because the characterization seems to be simply contrasted with the soul's loss of her prenatal knowledge in the present life.

57. The following sketch of Lee's view is based on J. S. Lee, *op.cit.*, pp.102-103.

58. E. Bréhier. *Op.cit.*, p.117.

59. By "eidetic causation" Lee means "a theory of the way in which the *eide* that make up the intelligible world of Being are the causes of sensible particulars" (*op.cit.*, p.96). He explains the intermittent character of eidetic causation in terms of the discursive nature of the soul's contemplative activity (*op.cit.*, pp.95-101). Although the intermittent character of eidetic causation, as Lee points out (*op.cit.*, p.101), is mentioned in VI 4-5, it would be impossible to explain it by the cognitive activity of the undescending soul, which is characterized as primarily non-discursive in VI 4-5.

**The Oriental Influences Upon Plotinus' Thought:  
An Assessment of the Controversy Between  
Bréhier and Rist on  
the Soul's Relation to the One**

Roman T. Ciapalo

The question of whether or not the thought of Plotinus owes any debt to what might be called the Oriental (or perhaps more precisely, Indian) intellectual tradition has been widely and fervently debated for many decades. Although it is possible, and indeed perhaps even likely, that no conclusive resolution to this controversy will ever be reached, at least in the absence of some dramatically new body of evidence—namely, the discovery of the Neoplatonic equivalent of the Dead Sea scrolls—it would nevertheless be worthwhile to revisit briefly the various arguments, pro and con, which have been put forth in order to determine their individual and collective merits.

Accordingly, in this paper I propose to do three things. I shall, first, briefly review the essential literature of this subject. Second, I shall summarize the argument between Emile Bréhier and John Rist over whether or not Plotinus was influenced by Indian thought. Finally, I shall offer my own assessment of the merits of the Bréhier-Rist argument in particular, and of the issue of Plotinus' "Orientalism" in general.

The general question before us would seem to be this: Are the apparent similarities between elements in Plotinus' thought and in various Oriental views, notably Indian thought, just that, mere *per accidens* similarities, or are they evidence of a stronger sort of relationship, namely, as Albert Wolters has articulated in his very illuminating article on this topic, "an 'influence', 'source', or 'determinative factor' on Plotinus"?<sup>1</sup>

That there appear to be points of similarity is largely not disputed, although A. H. Armstrong in his now venerable article ("Plotinus and India") denies that there is any sort of convincing *evidence* of Indian influences on Plotinus.<sup>2</sup> Likewise, John Rist, in his own way, disputes Bréhier's thesis.<sup>3</sup> Still others, like Willy Theiler, Philip Merlan, Cornelia De Vogel, and H. J. Kramer, belong, in one way or another, to the "anti-

Bréhier" ranks.<sup>4</sup> The question, of course, is what ought to be made of this phenomenon of similarity and what sort of importance to assign to it.

How might we classify the various perspectives on this issue? Perhaps in the following twofold way. Some might be counted as supporters of the milder position: what might be termed the "mere *per accidens* similarity" thesis. Others might be listed as supporters of the stronger position: the "direct causal influence" thesis. For our purposes, it might be convenient to appoint Rist as the representative of the former thesis, and Bréhier of the latter.

Let us now look more carefully at the positions of Bréhier and Rist. For Bréhier, there are good reasons to believe that Plotinus was influenced in a direct and causal way by Indian thought. In chapter seven of his very informative book, *The Philosophy of Plotinus*, his primary argument revolves around what he takes to be the double aspects of Plotinus' understanding of *Nous*. There, Bréhier notes. . .

that on the one hand, Intelligence is an articulated system of definite notions. On the other hand, it is the universal being in whose bosom every difference is absorbed, in which every distinction between subject and object comes to a complete end. In the first respect, it expresses the rationalist thesis that it is possible to have a knowledge of the world and that reality can be grasped through reason. In the second respect, it involves the mystical ideal of the complete unification of beings in the Godhead, with the feeling of intuitive evidence which accompanies it.<sup>5</sup>

Although Bréhier admits that the former view is the result of Plotinus' exegesis of Plato, Aristotle, and the Stoics, he argues that the latter cannot be so explained.

Furthermore, and more to the heart of the matter, the chief Plotinian problem, according to Bréhier, has to do with. . .

the relation of the particular being, of whose existence we are conscious, to the universal being. How did the conscious self, with its characteristics, its union with a fixed body, its faculties of memory and reasoning, emerge from the universal being and form itself in a distinct center? What is the relation of individual souls to the universal Soul? In general, how is the universal being present in its entirety in all things without ceasing meanwhile to be universal?<sup>6</sup>

For Bréhier, the soul's union with the One is ultimately not something to be explained in rational terms, but rather something to be experienced in a mystical way.

Later in the same chapter, he argues that. . .

the common and rather monotonous theme of all the Upanishads is that of a knowledge which assures the one possessing it peace and unflinching happiness. This knowledge is the consciousness of the identity of the self with the universal being.<sup>7</sup>

And in order to emphasize this point further, he notes that. . .

the philosophy of the Upanishads, in fact, does not go beyond the self. This is its characteristic trait. But it holds as certain that this self is without limits and that it is all things. It utilizes two fundamental concepts—that of Brahman, the universal being, the unfathomable principle of all forms of reality, and that of Atman, which is the principle in so far as it exists in the human soul, the pure self, independent of all particular functions of the soul, for example, as the nutritive or cognitive. The main thesis is that Brahman is identical with Atman, that is to say, . . . the force which creates and preserves the world is identical with what we discover in ourselves as our true self when we disregard all the activities related to definite objects.<sup>8</sup>

Bréhier claims to have found in the doctrine of the Upanishads the very same question that concerns Plotinus. . .

it consists in inquiring in what sense the self, in concentrating upon itself, finds within itself the very principle of the universe.<sup>9</sup>

Accordingly, this mystical element in his thought is to be explicated in extra-Hellenic terms. Thus, Bréhier argues. . .

we find at the very center of Plotinus' thought a foreign element which defies classification. The theory of Intelligence as universal being derives neither from Greek rationalism nor from the piety diffused throughout the religious circles of his day.<sup>10</sup>

In addition to this sort of internal evidence, Bréhier addresses various essentially historical facts to make his point, which, however, I

shall not treat explicitly here. Suffice it to say that, for a variety of doctrinal and historical reasons, Bréhier concludes that...

one must seek the source of the philosophy of Plotinus beyond the Orient close to Greece [whose cults maintained a variety of convictions and practices abhorrent to Plotinus, among them the idea of a mediator or savior destined to bring man into relation with God, ritual prayer, thanksgiving, and outpouring of religious feeling], in the religious speculations of India, which by the time of Plotinus had been founded for centuries on the Upanishads and had retained their vitality.<sup>11</sup>

To summarize, what relates Plotinus to Indian thought is...

his decided preference for contemplation, from which he derives the only true reality, his scorn for the practical moral life, and finally, the egoistic and universal character of the spiritual life as he conceived it. Indeed, in its highest stage, the spiritual life consists in the relationship in which the soul is 'alone' with the universal principle.<sup>12</sup>

Now, what of Rist's objections to this thesis? Rist's fundamental argument relies on R. C. Zaehner's four-fold division of mysticism - pantheistic or natural, ascetic, monistic, and theistic.<sup>13</sup> But, even though Zaehner himself did not locate Plotinus within his scheme, Rist argues confidently that the mysticism of Plotinus is of the *theistic* sort, "where the isolated soul attains to union and is 'oned' with a transcendent God, though *a fortiori* it is not itself identical with that God."<sup>14</sup> For him, accordingly, the mysticism of Plotinus is not monistic, "where the individual soul is declared to be completely identical with the power behind the universe - Atman is Brahman, as the Indian monists would put it,"<sup>15</sup> whereas, according to Rist and his unnamed "experts," the mysticism of the Upanishads is fundamentally monistic. Rist notes that...

it is precisely this monistic strand that Bréhier tries to find in the *Enneads*. There then in simple terms lies the difference between the two systems. And if the doctrines are unlike, derivation or significant influence can be forgotten.<sup>16</sup>

The crux of Rist's argument here seems to be that the human soul, since it consists of higher and lower parts, does not completely lose itself in its union with the One. Accordingly, he writes as follows:

When therefore the higher soul is enjoying the vision of the One, its lower counterparts do not strictly speaking cease to exist, but become irrelevant to the concentrated personality. Not that the union with the One is a 'self-conscious' union, for self-consciousness as normally understood only blunts the activities with which it is concerned, and in the mystical union the self is transcended or rather 'filled with God.'<sup>17</sup>

The soul, then, since it has a natural kinship with the Primal Reality can and does return to its source and becomes "united" with it. According to Rist...

such a return, as Plotinus tells us again and again, is a rest after our labours and a perfect stillness. But this rest is not a rest in nothingness, nor a blankness like dreamless sleep. True it is attained by a kind of 'confusion and annihilation' of *Nous*, but it cannot be attained without *Nous*, and should be viewed as the fulfillment rather than the negation of the level of existence. It is not blankness, but rapture, delight and perfect happiness. It is not nothingness... but everything, in the sense that the One is everything. He who understands the One understands the soul when it is 'oned'.<sup>18</sup>

At this juncture, how might one approach the evaluation of the controversy between Bréhier and Rist on the issue of the soul's relation to the One and, ultimately, on the question of the Oriental influences upon Plotinus' philosophy? Let me begin by reviewing what I take to be the first principles of Plotinus' philosophy. My struggles with the *Enneads* over the years have left me with the following three convictions. The first of these is fundamental to all Plotinian thought, namely, that to be real is to be one. As Leo Sweeney has noted...

Any item is real because of its unity and a fall into multiplicity is likewise a fall into unreality. So true is this that the more unified something is, the more real it is, with the result that what is totally simple is also the Primal Reality - namely, The One, the absolutely first and highest hypostasis.<sup>19</sup>

The second of these essential principles is as follows:

Whatever is one is good, since that which is one is not only real, but also is perfect and powerful.

This second principle inserts a dynamic aspect into Plotinus' universe, since it is bound up with the position that whatever is genuinely real must by that very fact cause subsequent realities, which turn back to their source because of dependency upon it and desire for it. This principle, then, issues into Plotinus' doctrines of procession and reversion (*prohodos* and *epistrophē*).<sup>20</sup>

The One-Good, then, has a dual status. It is both the source of all subsequent realities (by causing them through its overflow) and the object of their desire and love (by being that upon which they depend for their ultimate perfection and fulfillment).

Finally, because whatever is one is also good—"good to others by producing them automatically and necessarily, good for others as the object of their seeking,"<sup>21</sup> it follows that the third essential principle is that "whatever is prior is of greater reality than that which is subsequent."<sup>22</sup> In other words, "the relationship of prior/subsequent is simultaneously a relationship of higher/lower in actual values."<sup>23</sup>

Thus, the third principle illuminates the essential nature of the relationship between the One and its overflow. Generally speaking, what is prior is of greater worth, importance, and reality than what is posterior. All levels of reality below the One, then, are thereby less real than the One, precisely because they are less unified than the Primal Reality. As such, these lower levels of reality are *logoi* of the One: they are the One, but as found on a lower, less unified level.

Now, armed with these three Plotinian principles, I wish to argue that Plotinus' account of the final stage of the soul's ascent to and unification with the One may be seen as the conclusion of a long and careful deductive argument whose major premise is that first principle mentioned earlier—to be real is to be one. The existential status of both the human soul's ascent to the One and its actual union with the Primal Reality is, to be sure, a mystical one. For surely at that supreme level of achievement, the soul's relation to the One involves no duality of whatever sort and is no longer rational in nature, but rather is supra-rational, and, hence, mystical (or to paraphrase Zaehner, monastically mystical). Accordingly, on this point I find Bréhier's position more appealing than Rist's. As attractive and forcefully articulated as the latter's arguments are, they force us to abandon, or at least weaken, what is central to Plotinus' thought—his consistent monism. And this I cannot bring myself to do.

What is most interesting about this area of his thought however, is that he is thoroughly Greek in his approach to philosophical problems. Namely, he is eminently rational. Yet he is led by the relentless application of his logic to eventually draw conclusions that themselves defy complete penetration by human reason, because ultimately they are in their content supra-rational, or, in other words, mystical.

It appears to me that at various junctures of his speculation he notices that the power of human thought, or human rationality itself, if you will, is inadequate to the ultimate task before it, namely, the understanding in a discursive way and the eventual articulation in human language of the individual human soul's relationship to the Primal Reality. He comes closer than other Greek thinkers have in explicating the nature of this union, however inadequate even his articulation may be. In the final analysis, then, it is Plotinus' essentially monistic viewpoint, coupled with the virtual ruthlessness of his logic, that leads him to draw conclusions that seem to defy rational penetration and thus appear to be mystical in nature, but which nevertheless are the necessary implications of his line of reasoning, whose starting point is the trio of fundamental principles enumerated earlier. Among these conclusions, I believe, is the view that the human soul does indeed lose its identity in its ultimate unification with the One.

Now, what has all of this to do with the question of Plotinus' Orientalism? Although several studies have already considered this issue in a most admirable fashion, among them the studies of Staal, Schlette, and, more recently, Tripathi and Wolters being worthy of special mention,<sup>24</sup> let me conclude this presentation with a few remarks of my own on this matter.

First, although it is entirely possible that the thought of Plotinus on the question of the soul's relation to God, and perhaps on other issues as well, was influenced in some direct and causal way by the Orient, I cannot, on the basis of my analysis, go beyond the available evidence, which is essentially oblique and circumstantial. Hence, I believe Bréhier goes too far in asserting that Plotinus indeed was indebted to Indian sources. In other words, I am uncomfortable with anything more than a "*per accidens*" explanation of the apparent similarities. Certainly, there seems to be little if any justification for the stronger "direct causal influence" thesis.

Second, there would not seem to be much, if any, merit to the adoption of a fundamentally agnostic stance on this question as long as new, relevant, and conclusive evidence is not brought to light. Frankly, I do not look upon such an eventuality with any great degree of optimism. That is why I am led to the following conclusion. It would not be inappropriate, I think, to seek a kind of middle ground on this issue, midway between what perhaps may be termed the two extreme positions of Bréhier and Rist. Such an intermediary stance would affirm the following three points:

1. There seems to be a striking affinity between relevant elements in Indian thought and in Plotinus, particularly in the description of the soul's striving toward union with God and of the nature of that union. One need only compare the description of the human soul's ultimate and complete union with the One found in the *Enneads* with the identification of Atman with Brahman found in Indian thought.
2. There is no need, however, from an exegetical point of view, to argue for the necessity of Oriental influences upon Plotinus. Why? Because he arrives at his conclusions by means of the consistent application of his logic to his three principal insights, particularly, the first—to be real is to be one. There is an internal consistency within his position such that all of his conclusions flow naturally from those fundamental insights.

3. It is possible that the affinities between Plotinus and the Orient constitute evidence of the existence of something which currently does not enjoy much popularity, but which nevertheless may be of value for our present purpose, namely, the concept of a perennial philosophy, defined here as a philosophy which is both permanent and significant, precisely because its features transcend historical and cultural changes.

In the final analysis, this last point may constitute the most satisfactory answer to the problem at hand. It is not so much a question of chronology or causal influence, I believe, but a matter of concomitant or parallel insights, independently reached. There is too little evidence to suggest anything more than this. And, as Wallis has argued . . .

the tendency of the mystical experience to express itself in similar ways at all times and in all civilizations must also be taken into account.<sup>20</sup>

In this way, perhaps one can say that there is a measure of Orientalism in Plotinus and not at the same time impugn his philosophical originality, intellectual gifts, or Greek heritage.

I favor this "perennial philosophy" thesis, then, primarily because it offers the possibility of a profoundly constructive solution to the problem of adjudicating cross-cultural influences, whether philosophical or otherwise. This thesis represents a positive approach to the solution to the problem and is not fraught with the divisive and counter-productive elements of the alternatives. It affirms, I believe, what we all suspect, or at least hope, is the case, namely, that human experience is fundamentally universal. Perhaps, then, what I have been discussing is but one instance of the affirmation, in both Eastern and Western voices, of the common elements of human experience. Perhaps, for our purposes, it might be possible to speak of Plotinian Hinduism, or of Hindu Neoplatonism. In this way, the thought of Plotinus might function as one of the intellectual bridges across that great chasm that has divided East and West for so long.

## Plotinus and Interior Space

Frederic M. Schroeder

A.H. Armstrong entitled his pioneering book *The Architecture of the Intelligible Universe in the Philosophy of Plotinus*.<sup>1</sup> This title has entered and informed the language of Plotinian scholarship.<sup>2</sup> It is the purpose of the present paper to explore an aspect of "intelligible architecture" which, I would suggest, has been largely neglected. The architectural metaphor suggests a verticality, hierarchy, and externality that Plotinus counterbalances with another architecture, that of interior space.

H. P. L'Orange, in his *Art Forms and Civic Life in the Late Roman Empire*, speaks of the dissolution of the classical building structure in late antiquity with an abandonment of emphasis upon the external appearance of the building. However, he observes,

A positive side of this transformation is a new experience of space, a new feeling for the interior itself, which is an expression of the new spirit of the time. An appreciation of this positive side makes it possible for us to meet with a better understanding the peculiarly abstract as it were, the distant glance which we have continually encountered in Late Antiquity... Architecture becomes introspective. The building structure is reduced to a mere shell surrounding what is encompassed. It becomes no more than the enclosure of space.<sup>3</sup>

and further:

Above all, light is the space-creating element and models in its various intensities the different parts of the interior.<sup>4</sup>

He also remarks:

A completely new aesthetic was developed during the third century: beauty does not reside in the proportions of the body, but in the soul which penetrates and illumines it, that is, in expression (the *Enneads* of Plotinus). Beauty is a function of the inner being (*τὸ ἐνδον εἶδος*).<sup>5</sup>

L'Orange does not remark, however, on the possibility that Plotinus may ground the sculpting of inner space in the architecture of late antiquity.

Let us examine some passages that use interior space in figurative language describing the intelligible world. We may turn now to an example of interior space in Plotinus that illustrates these principles with reference to the soul's vision of the One (6.9 [9].11.17-23):

Like a man who enters into the sanctuary and leaves behind the statues in the outer shrine; these become again the first things he looks at when he comes out of the sanctuary, after his contemplation within and intercourse there, not with a statue or image but with the Divine itself (οὐκ ἄγαλμα οὐδὲ εἰκόνα, ἀλλὰ αὐτό); they are secondary objects of contemplation. But that other, perhaps, was not an object of vision, but another kind of seeing (οὐ θέαμα, ἀλλὰ ἄλλος τρόπος τοῦ ἰδεῖν).<sup>6</sup>

The god in the inmost sanctuary is "not an object of vision" (θέαμα), but "another kind of seeing" (ἄλλος τρόπος τοῦ ἰδεῖν).

Trouillard says of the vision of the One that what is required is, not a different object of regard, but a change in our way of looking:

Il est clair qu'il ne s'agit pas de renoncer à tel ou tel objet, mais à une optique, à un système de valeurs: "changer son regard" (1.6.8.25), "chasser les croyances imposées du dehors" (III.6.5.17) "s'éveiller des représentations absurdes" (III.6.5.24) "non plus une contemplation, mais une autre façon de regarder" (οὐ θέαμα, ἀλλὰ ἄλλος τρόπος τοῦ ἰδεῖν) (VI.9.11.2 2). Et cet abandon n'est possible que sous l'influence d'une illumination antérieure.<sup>7</sup>

Of the passages cited, only one (1.6 [1].8.25-26) offers a linguistic parallel to the crux at 6.9 [9].9.11.22-23 (οὐ θέαμα, ἀλλὰ ἄλλος τρόπος τοῦ ἰδεῖν) in its requirement to "change to another way of seeing" (ὄψιν ἄλλην ἀλλάξασθαι). This phrase, however, clearly refers to a change in *our* way of vision, whereas in 6.9 [9].11.22-23 the One is described as another way of seeing. Trouillard's interpretation requires a metonymous transference of the seeing in question from the One to ourselves. The discipline of strict construction (which I shall argue is the most fruitful approach) demands that we insist that, in some sense, the One is itself "another way of seeing."

Bréhier translates, "un mode de vision tout différent." This translation appears to require, as does Armstrong's (which I use here) and Trouillard's interpretation, that the vision in question be *our* vision, a vision that is transformed. Yet it is the One that is described as (another) way of seeing. However, Bréhier comments, "C'est la vision unitive dont il était question tout à l'heure."<sup>8</sup>

What Bréhier has in mind with this comment may be illustrated by Arnou's interpretation of the phrase as:

Une contemplation où s'est effacé la distinction entre le sujet et l'objet, où il ne faut plus parler de θέαμα, (VI.9.10; VI.9.11), ni de θεωρῆς, (V.8.10).<sup>9</sup>

In the same vein, Rist argues that Plotinus, who really prefers the language of union, employs the language of sight in deference to Plato who uses it of the experience of the ultimate principle in the *Symposium* (Beauty) and in the *Republic* (the Good).<sup>10</sup>

The claim that the phrase "another way of seeing" refers, not to a transformation in *our* way of seeing, but to a suspension of the subject-object distinction in the act of vision, still requires an evasion of the Plotinian ascription of this phrase to the One itself. Plotinus could have said that vision of the One demands such a suspension, but he does not say this. He says rather that the One is "another way of seeing." Implicit in the metonymous interpretations of this phrase that we have examined must be the notion that such a strict construction is to be avoided simply on the grounds that it makes no sense. Plotinian scholars disagree on the question of whether the One has any form of consciousness, even of itself.<sup>11</sup> Such a consciousness, however, would surely never be described by the language of vision which obviously carries the subject-object distinction with it and would thus violate Eleatic principle.

We may now turn to similar language in another passage. Plotinus describes the progress of the human soul from the vision of the Platonic Forms in Intellect to the vision of the One (6.7 [38].35.7-16):

It is as if someone went into a house richly decorated and so beautiful, and within it contemplated each and every one of the decorations and admired them before seeing the master of the house, but when he sees that master with delight, who is not of the nature of the images [in the house], but worthy of genuine contemplation, he dismisses those other things and thereafter looks at him alone, and then, as he looks and does not take his eyes away, by the continuity of his contemplation he no longer sees a sight, but mingles his seeing with what he contemplates, so that what was seen before has now become sight in him, and he forgets all other objects of contemplation (ὥστε ἐν αὐτῷ ἤδη τὸ ὁρατὸν πρότερον ὄψιν γεγονέναι, τῶν δ' ἄλλων πάντων ἐπιλάθοιτο θεωμάτων).

Even as the god in 6.9 [9].11.22-23 is described, not as an object of vision, but as another way of seeing (*ἄλλος τρόπος τοῦ ἰδεῖν*), so here it is said that in him (*ἐν αὐτῷ*) [*sc.* the master] that which was an object of vision has become vision (*ὥς*). Again, we might be tempted to a metonymous transference of vision from the object of vision to ourselves, or construe this language in such a way that it would simply explicate the union of vision with its object. However, a strict construction would again demand that we understand the ostensible referent (in this case the master) as indeed in some sense (yet to be defined) as "vision."

To understand the sense in which the One may be "another way of seeing" or "vision," we must digress to the subject of Plotinian optics. Plotinus polemicizes against the view that sense-perception results from the imprinting of a sense-impression upon the soul (4.6 [41].1.14-21):

It is clear presumably in every case that when we have a perception of anything through the sense of sight, we look there where it is and direct our gaze where the visible object is situated in a straight line from us; obviously it is there that the apprehension takes place and the soul looks outwards, since, I think, no impression has been or is being imprinted on it, nor has it yet received a seal-stamp, like the mark of ■ seal-ring on wax.

Plotinus examines the question of why it is that distant objects appear small (2.8 [35].1). When things are far removed from us, we do not see them in their detail. It is by measuring from the several objects in a landscape in relationship to each other that we arrive at the size of the whole (33-36):

What happens to them [*sc.* colours and sizes] becomes clearer in things of many and varied parts, for instance, hills with many houses on them and a quantity of trees and a great many other things, of which each individual one, if it is seen, enables us to measure the whole from the individual parts which we observe.

Plotinus comments further (47-51):

And things far off appear near because the real extent of the distance appears in its true extent, from the same causes; but the sight cannot go through the far part of the distance and see its forms as they really are, and so it is not able to say how great in magnitude it really is.

The art historian André Grabar argues that the optical theory set forth in these passages grounds the aesthetics of space in late antique and early medieval plastic art. There the perspective or angle of vision belongs, not to the spectator of the work of art, but to the central figure. Thus the perspective may be inverted, so that everything is seen from the point of view of the central figure. Also, the other objects radiate from the central figure to the same effect. The result is that the spectator enters into the perspective of the central figure. Thus the apprehension has its locus, not in the percipient (the spectator), but in the perceived (the central figure in the work of art) and the whole is measured from the central figure.<sup>12</sup> One could surely say that the central figure is, in this sense, "another way of looking," or "vision."

Art historians distinguish two theories of perspective, the *perspectiva naturalis*, or natural perspective, and the *perspectiva artificialis*, or artificial perspective. The artificial perspective is the perspective familiar to us from the painters of the Renaissance, such as Raphael (we may think of his *School of Athens*). In this perspective, the eye is regarded as immobile and the scene is static. Everything is measured from the angle of vision of the ideal spectator. Space is organized with respect to this orientation (it is in Panofsky's terms a *Systemordnung*).<sup>13</sup> In the natural perspective, which belongs to classical art, the ray from the object is projected on the internal surface of the extremity of a visual sphere, the retina. Our field of vision is spherical and the image we have of an object is projected onto a concave surface. Only the ray which is rigorously perpendicular to the retina will suffer no deformation (vertically, horizontally, and longitudinally), but the others will in proportion as they are removed from that central ray. The size of objects is given, not by their distance from the eye, but by the measure of the angle of vision. The evaluation of the size of an object is expressed in degrees of angles or arcs and not in simple sizes.<sup>14</sup> The size of the object varies, not with distance, but with the angle of vision.<sup>15</sup>

In the artificial perspective, the artist imposes a geometrical order proper to plane surfaces upon empty space. In the natural perspective, the space is not empty, but is a function of the things seen. Their inclusion is additive, rather than belonging to a systematic organization of empty space. In Panofsky's language, this is not a *Systemordnung*, but an *Aggregtraum*.<sup>16</sup>

The artificial perspective would more readily direct our attention to the central figure than would the aggregate inclusion of objects about a central figure as in the natural perspective. In the former the systematic organization of space is designed precisely for that indicative purpose.

Plotinus argues against the theory that the relative size of perceived objects is governed by our angle of vision, preferring the theory that we have examined above.<sup>17</sup> It is clear that his perspective inclines toward the natural, rather than toward the artificial perspective. We should for this reason expect that it views a scene in terms of additive inclusion, rather than of systematic organization of space. Of course, such a scene may also be controlled by a central figure (around which, of course, the scene is organized according to its perspective, rather than the perspective of the ideal spectator).<sup>18</sup>

Plotinus presents a phenomenology of illumination. We see all things by means of light. Light, so long as it is merely an instrument of vision, is among the intentional objects of consciousness. It is "seen together with" with them (*συνωρόμενον*). Yet it may also become the theme and focal object of consciousness, so that all is seen as light or a function of light. Plotinus develops this investigation of light in describing how Intellect experiences the dawning vision of the One. Yet it is applicable to all illumination, including the manifestation of light in the sensible world.<sup>19</sup> Notice that this transformation of our vision requires no conversion in the sense of turning away from one thing and looking at another as in the illuminationist passage concerning the Sun and Cave in Plato's *Republic*.<sup>20</sup> The light and the illumined objects are beheld conspectively.

Let us now return to the passage describing the experience of the great man and his splendid house.<sup>21</sup> We need not think that the separation between our admiration of the appointments of the house and our vision of the great man is merely temporal, so that now we see the objects of the house, and then the great man. Certainly we do not need to turn around in order to see the great man. The interior of the house and its appointments may be seen conspectively even as the light is experienced conspectively with the objects that it illumines. It is rather that the great man is the central object that provides the angle of vision from which we may measure and evaluate the other objects in the scene. In a sense, the great man is the light by which they are illumined. It is his taste and his mind that is reflected in the interior space. As we come to this realization, the great man is thematized as the focal object of consciousness.

An optical theory that grounds an aesthetic belonging properly to painting on plane surfaces (or relief sculpture) is adapted to architectural uses. In the interior of the great house, of course, the mobility of our vision is more actual than is the fictive illusion of that mobility in the painting. Indeed the great man is, not merely an object of vision, but vision (*ὄψις*), as he informs and interprets the entire scene.<sup>22</sup> Again, the

natural perspective lends itself more to the kind of gradual and dawning apprehension of the primary figure than would the artificial perspective that so abruptly guides the eye to the central point.

Although in the previous passage there is no mention of illumination, Plotinian illuminationist theory is helpful toward its interpretation. The point about the central object of the piece being a source of illumination to other objects becomes explicit in the following passage in which the soul's vision of the One as light is described (5.3 [49].17.30-37):

We must think that he is present when, like another god whom someone called to his house, he comes and brings light to us: for if he had not come, he would not have brought the light. So the unenlightened soul does not have him as god; but when it is enlightened it has what it sought, and this is its true end, to touch that light and see by itself, not by another light, but by the light which is also its means of seeing. It must see that light by which it is enlightened: for we do not see the sun by another light than his own.

Above we examined the passage concerning the man who enters the sanctuary and leaves behind the statues in the outer shrine to see, not a statue, but the god himself within who is not an object of vision, but another way of looking.<sup>23</sup> In that passage, unlike the passage about the great man in his house,<sup>24</sup> the vision of the first things seen and the primary figure is not conspective, but successive. Yet we may still say that the perspective with which the statues outside the sanctuary is seen upon the departure from it belongs to the primary figure in that the contemplative sees the other statues now, not from his own, but from its perspective. Both passages treat of interiors, but in the first, the progress into inwardness involves a spatial progress within not demanded by the second.

As I suggested above, the real tendency of the figurative use of interior space in Plotinus is to qualify the spatial metaphor of conversion, of turning as from one thing as to another thing. It is not simply the substitution of one spatial metaphor (inwardness and depth) for another (verticality and ascent).

Plotinus asks how we may see the ultimate Beauty of Plato's *Symposium* (1.6 [1].8.1-5):

But how shall we find the way? What method can we devise? How can one see the "inconceivable beauty" which stays within in the holy sanctuary (*οὐκ ἔνδον ἐν ἁγίοις ἱεροῖς μένον*) and does not come out

where the profane may see it? Let him who can, follow and come within, and leave outside the sight of his eyes and not turn back to the bodily splendours which he saw before.

The passage concludes (lines 21-27):

Our country from which we came is there, our Father is there. How shall we travel to it, where is our way of escape? We cannot get there on foot; for our feet only carry us everywhere in this world, from one country to another. You must not get ready a carriage, either, or a boat. Let all these things go, and do not look. Shut your eyes, and change to another way of seeing (ὄψιν ἄλλην ἀλλάξασθαι), which everyone has but few use.

Notice here again the "other way of seeing" which is common to such descriptions.

The only appropriate conversion (ἐπιστροφή) is that of the aspatial, atemporal, and non-dualistic turning of the One toward itself (5.1 [10].6.12-19):

The contemplator, then, since God exists by himself as if inside the temple, abiding quiet beyond all things (μένοντος ἡσυχου ἐπέκεινα πάντων), must contemplate what correspond to the images already standing outside the temple, or rather that one image which appeared first; and this is the way in which it appeared: everything which is moved must have some end to which it moves. The One has no such end, so we must not consider that it moves. If anything comes into being after it, we must think that it necessarily does so while the One remains continually turned toward itself (ἐπιστραφέντος αἰεὶ ἐκείνου πρὸς αὐτόν).<sup>25</sup>

The words "beyond all things" (ἐπέκεινα πάντων) here recall the Platonic description of the Good as "beyond essence" (ἐπέκεινα τῆς οὐσίας) in the *Republic* 509b9. In light of the topography of the Sun and the Cave, we may wish to see in Plato a transcendence appropriate to a vertical structure of intelligible architecture. Here, the One or the Good is beyond by being within.

Notice here the language of "abiding in silence" (ἡσυχου μένοντος).<sup>26</sup> The verb "abide" (μένειν) is used in other contexts of the production of what is below the One in undiminished giving. The source abides in its native and intransitive activity and there proceeds from that activity, with no deliberation or external movement on the part of the

One, a transitive activity, as warmth from a flame or light from a luminous source.<sup>27</sup>

Such effortless production is expressed by the language of abiding (μένειν) and silence (ἡσυχία, σιωπή).<sup>28</sup> I have argued elsewhere that this model of effortless and unmediated production counter-balances that of the Demiurge conceived as an agent external to the pattern and the copy who mediates between them and exercises deliberative thought. The demiurgic model implies a vertical space between the pattern and the copy, a space that must be bridged by demiurgic intervention. The present passage suggests that the silent abiding of the One is located in the context of inwardness. Plotinus also counsels that our manner of returning to the One, our source, is to practise its quietness and abiding.<sup>29</sup>

The Soul's effortless production of the sensible world is described in terms of the relation of an architect to a house he has created, but in such a way that he builds without effort and from within his own spirit (4.3 [27].9.29-44):

There came into being something like a beautiful and richly various house which was not cut off from its builder, but he did not give it a share in himself either; he considered it all, everywhere, worth a care which conduces to its very being and excellence (as far as it can participate in being) but does him no harm in his presiding over it, for he rules it while abiding (μένων) above. It is in this sort of way that it is ensouled; it has a soul which does not belong to it, but is present to it; it is mastered, not the master, possessed, not possessor. The universe lies in soul which bears it up, and nothing is without a share of soul. It is as if a net immersed in the waters was alive, but unable to make its own that in which it is. The sea is already spread out and the net spreads with it, as far as it can; for no one of its parts can be anywhere else than where it lies. And soul's nature is great, just because it has no size, as to contain the whole of body in one and the same grasp; wherever body extends, there soul is.

How is it that the world is in the Soul, or the house, as it were, in the divine architect, rather than *vice versa*? The Greek verb "to be" contains an inherent locative value. This fact is evidenced in the sophistic conundrum that, if place is, it must be in place, and so forth to infinite regress.<sup>30</sup> This locative value is in Homer very often inseparable from the existential value of the verb.<sup>31</sup>

It is doubtless because of the inherent locative value of the verb "to be" that Plato feels constrained to locate the Forms somewhere. In

the *Phaedrus* they are in a "place above the heavens"<sup>32</sup> and in the *Republic* (with greater subtlety) in an "intelligible place."<sup>33</sup>

Aristotle defines place as the inner limit of the containing body.<sup>34</sup> From this definition he draws the important corollary that the universe as a whole is not in place since it has no containing body.<sup>35</sup> In general, the ancients had, not a concept of space as a discontinuous and homogeneous medium to be filled with things, but place as a function of each thing that is.<sup>36</sup>

Aristotle rejects the notion that there can be an actually infinite.<sup>37</sup> Plotinus reasons that that principle that confers limit need not itself be limited. Thus, while Intellect is, in its relation to the One, limited, the One, which confers limit upon it, is unlimited.<sup>38</sup> Thus, although he agrees with Aristotle that the corporeal universe cannot be contained by the inner limit of a further containing body, the Soul, that is (in relation to the corporeal world) unlimited, contains the world in the sense that the unlimited principle that confers limit contains the limited as the greater contains the lesser.<sup>39</sup> Each hypostasis contains its inferior in this manner, as each is unlimited with respect to its inferior and limited with respect to its superior.<sup>40</sup> We may conclude that for Plotinus the spiritual pleroma is the place or container of the corporeal world.

At the moment of the epiphany, the interior that is designed to contain the divine presence is itself embraced by the god. To this inversion of location there corresponds an inversion of perspective. We, the spectators, are located within the angle of vision belonging to the god (even though we cannot be the *intendum* of his consciousness). In "another way of looking," we are introduced to an agreeable awe and sense of our own place in the scheme of things as we discover that the epiphany is not altogether our project (even though it cannot belong to demiurgic deliberation on the part of the god). It is indeed true that the effect of this phrase is to overcome a subject-object distinction. Yet that effect results, not so much from our effort to see, as from the way which the thing seen imposes itself upon our vision. The One retains its sovereignty in our experience of it. While the One may be the Good for us, it is so by being the Good in and of itself.

The imagery of interior space occurs in Plotinus as an illustration of metaphysical and spiritual truths. Thus Plotinus does not show a direct interest in the aesthetics of interior space for its own sake. Indeed it is difficult and typical of this author that one is hard put to test his interest in the sensible world, for everything in it seems but an explication of what is enfolded in the intelligible world. Yet this very fact tells us much about the imagery of interior space. That which constitutes the internal space is intelligible form as its interior and formative principle. The

object of the metaphor is the very principle of architecture and spatial organization. It is not so much that the god appears in space as that, by appearing, he creates place. Indeed he is the place in which the objects that occupy the interior appear in numinous transparency.

<sup>18</sup> Gian Paolo Lomazzo, in Chapter XXVI, "Del modo di conoscere e costituire le proporzioni secondo la bellezza," of his treatise *Idea del Tempio della Pittura in Scritti sulle Arti* ed. R. P. Ciardi, vol. I (Florence: Marchi and Bertolli, 1973), 311, following Ficino's account of beauty in his commentary on Plato's *Symposium*, argues that order does not consist in quantity, but in the relation of the parts or members of the composition to each other. Measure is not itself a part or member of the composition, but resides in all the parts or members. Measure is not material, because measure is the limit of quantity and consists in lines and points that have no depth and thus cannot be corporeal. Thus Lomazzo offers a Renaissance and Neoplatonic argument for natural, and against artificial, perspective. I thank Dr. Paulos Mar Gregorios for this reference.

## Unity and Multiplicity: Reflections on Emanationism as a Philosophical Theme in the Context of Neoplatonism

P. K. Mukhopadhyaya

### I

I wish to discuss here the theme of Emanation in the context of Neoplatonism and Indian Philosophy. I argue that Emanationism can be conceived as (and it was perhaps so conceived originally) a powerful alternative to what is called "creationism", an alternative which has within its scope both empirical selves or *jīvas* and the created inanimate world; but as the doctrine has been developed, discussed and criticized many other considerations have been allowed to become mixed with it. Perhaps this is as it should be; nothing wrong or unusual. But for proper appreciation of the theme and also to avoid unmerited criticism or undeserving praise we should be very clear as to which tenets of the Neoplatonist philosophy of Emanationism are logically related and which are logically independent.

The problem is less acute when we consider the two Indian schools of philosophy, which advocate two versions of *Saṅkhyavāda* or Emanationism-II. Within none of these schools there is much internal difference. But interschool difference is quite clear even though one version of *Saṅkhyavāda* is advocated by both the schools. On the other hand considered as a single school internally distinguished into four sub-schools, Neoplatonism or Emanationism-I exhibits major internal differences in respect of the conception of emanation and other matters of philosophy and religion. But the four forms of Emanationism-I are not so clearly distinguished as the two versions of Emanationism-II.

My choice of this theme for discussion here is not without reason. In the first place I think that it is neither impossible nor so unnatural to view the theme of Emanation as essentially the philosophical theme of the One and the Many. When so viewed one can find in this theme a counter-

example to some familiar misconceptions (to which I refer below) about ancient philosophy in general and classical Indian philosophy in particular. My second reason is that an Indian philosopher is in a better position than scholars belonging to many other cultures to appreciate and respond to the Neoplatonist doctrine of emanation. For Emanationism-I as well as Emanationism-II emerged in non-Christian pagan culture. Even if we ignore the attitude of indifference or opposition to Christianity of many Neoplatonist emanationists yet so far as Emanationism distinguishes itself from Creationism it is anti-Christian in spirit. Perhaps this partly explains how a scholar who is otherwise universally known for his objective and unbiased approach misunderstood the Neoplatonic doctrine of emanation in the following passage, if of course it is, as I think it is, an actual case of misunderstanding:

"... they (the Neoplatonists) failed to see the unsatisfactory character of their attempt to steer a middle way between a true creation and monism, and that their theory of "emanation", given their denial of creation out of nothing on the one hand and their denial of the self-dirruption of God on the other hand, could possess no intelligible significance, but remained a mere metaphor. It was left for Christian philosophy to assert the true solution of *creatio ex nihilo, sui et subiecti*."

Emanation is a topic around which there is a prospect of meaningful dialogue taking off among scholars of different cultures. Such a dialogue in the context of varying cultures can enrich the concerned doctrines through exchange of insights and arguments. Standard expositions and criticisms of the different versions of emanationism are rigorously analytical and the respective philosophies to which these versions belong are highly developed. Even if elements of metaphor or mysticism mark the theory of emanationism in some or all the schools of Neoplatonism, it does not follow that the theory admits no rigorous rational formulation.

One of the misconceptions to which I referred above may not always be publicly proclaimed, or even explicitly or consciously affirmed, in so many words, but it seems present behind the back of the mind of many. Philosophy had no distinctive subject matter before the birth of modern European science. In the Middle Ages of Europe, either there was no philosophy or the philosophy that was there did not have any distinctive matter. This is thought to be true as much about India as about the

medieval West. Any attempt to say that there was philosophy is considered to be a sure case of equivocation with the word "philosophy". Any substantive subject which received serious attention of thinkers in those ages would immediately be set aside as religious at bottom. This betrays a firm conviction that so called philosophy in the Middle Ages had no distinctive subject matter; it was religion or theology.

A very wide spread view about Indian philosophy in general is that it is a thing of the past. The Modern scientific revolution did not take place in India or in any Asian country. Whatever may be the reason for that, Indian philosophy could not, according to this view, have or have had, then or now, the proper subject matter of philosophy as has developed in modern times; it remained confined to its medieval setting. Any philosophy that may develop in modern India must be therefore on themes taken over from the Modern scientific West. Many scholars in modern India think that what goes in the name of philosophy in modern India is not strictly speaking Indian, and the type of literature of medieval India, now-a-days referred to as philosophy, is not really that if we keep to the more or less precise and technical sense the term philosophy has in the land of its origin.

Philosophy, according to some, is nothing if it is not epistemology or analysis themes and subjects forced on us by developing science. If one tries to argue that even in ancient times very great importance was given to analytical rigor and precision of expression, one is likely to be told that that was all scholasticism—an attitude wherein this emphasis on method ensues mostly in the absence of substance or failure to tackle substantive issues. It is a type of scholarship which evaded completely any commitment to real life and its concerns; it is full of artificialities. In the absence of a serious and sincere effort at analysis informed by the new discoveries of science and necessitated by the impact of such discoveries on the developing conception of science, all we have in the middle ages, according to these, is idle logic-chopping. If one tries to argue on the other hand that there had been much discussion on such substantive and serious problems as unity, universals etc. more often than not one will be told to probe deeper and discover for oneself that both the nature of the problem and the motivation behind taking it up for discussion were religious.

The problem of Emanation as discussed in Neoplatonism and its near analogue *Satkāryavāda* in India was not necessarily regarded as a strictly religious theme. It had been originally and prominently discussed

by non-Christian pagan scholars. But just as in India many non-theist philosophers contributed to this problem so also among the Neoplatonists some at least could clearly keep their discussion of the problem free from whatever religious commitment they had. The idea of emanation in which we are particularly interested here has a history much older than Christianity. The idea was brought to Christianity from Neoplatonism and the Neoplatonists are mostly not only not Christian; but some of them were fighting against Christianity.

In India though the history of the analogous doctrine, Emanationism-II, a term we shall use here to refer to the theories of *Satkāryavāda*, cannot be claimed to be older than the *Vaidika* culture; yet the *Vaidika* culture cannot be equated with Hinduism in the popular, narrow and Indologist/Orientalist sense of a mere form of religion. Thus both Emanationism-I and analogue-emanationism or Emanationism-II as we shall call it here, are in a sense neutral to either paganism or to any form of religion. But Neoplatonism of the West on the one hand and the *Sāmkhya* and *Advaita Vedānta* systems of thought, which advocate the two familiar and major forms of emanationism in India on the other, have certain similarities. Soteriological concern, emphasis on spiritualism, asceticism and to some extent an attitude of other-worldliness are quite visible in both.

One word about the terminology adopted here may be in point before we proceed any further. In most of the standard expositions of *Sāmkhya* thought in English the expositors use the expressions evolution and evolutionism where I have been and will be using the words emanation and emanationism. Emanationism is a process which according to the Neoplatonists provides a better description of the way the multiplicity or the many came to be there from the first single principle or the "first cause". The term used for the analogous process by the *Sāmkhya* *Satkāryavādins* is *parināma*. And the process of *parināma* agrees with the process of emanation in some of those essential features in which emanation is commonly contrasted with evolution. Evolutionism advocates a certain actual and temporal process of change and transformation which is, at the same time, a process of development and progress in some specifiable sense of the term.

But in the first place it is at least doubtful if the advocates of emanationism or of *parināma* doctrine believe their process to be temporal or developmental. It may also be noted that there is another process, let us

say, of reverse transformation which many of the emanationists and *parināmavādins* admit. Whether a belief in it is strictly consistent with the philosophy of emanationism as distinct from evolutionism is a different issue. But the doctrine of evolution does not normally permit a process of reverse evolution.

These and some other similar considerations suggest strongly that evolution and evolutionism may not be the most suitable expressions for the exposition of *Sāmkhya* thought. This explains our preference for coining a new expression Emanationism-II to refer to the Indian version of emanationism. In spite of its difference from the emanationism-I of the Neoplatonists, the *Sāmkhya* doctrine of *satkārya* and *parināma* are closer to emanationism than to evolutionism.

## II

The striking similarities between Emanationism-I and Emanationism-II will be apparent to the reader if he cares to look into any standard account of these doctrines. It would be helpful if I could present here, side by side, some of the comparable theses of these doctrines. I may attempt that at the end of the paper if space permits.

What I want to do at this stage is develop some basic themes of the philosophy of Emanationism and make specific reference to the views of both Emanationists-I and Emanationists-II as and when necessary. To begin with there are two questions which may naturally be expected to be raised. The first is, "How could such a philosophy of Emanationism ever suggest itself to the thinkers of any particular culture or at any particular period in history?" It may be thought that it is not a proper question to ask a philosopher of Emanationism; neither is a philosopher particularly obliged to answer such questions. It is a question for the historians and historians of philosophy. Without disputing that this may be generally true, the reason why I ask this question will become clear soon. The second question is why in the theory of Emanationism the One or the first principle, cause, or hypostasis, starts emanating at all? Why must the One start multiplying itself?

In the system of Plotinus, from the One comes by way of emanation the *nous*, which is variously rendered as Intelligence, Spirit, Mind and so on. From Intelligence emanates *Psyche* or Soul. These are

said to correspond to the three realms of the ideas, the mathematical and the sensibles which, according to Aristotle, Plato admitted.

In one of the two schools of Emanationism-II, viz., the *Sāṃkhya* school, the first cause or principle is called both *Pradhāna* and *Prakṛti*. The etymology of these two words tells us clearly that it is the source of everything other than itself and that it is the First and hence it comes from nothing else. So both the One of Emanationism-I and the *Prakṛti* of Emanationism-II are eternal and uncaused. From *Prakṛti* emanates all the rest. The total number of items which emanate from *prakṛti* at least from the point of view of the general *Sāṃkhya* philosophical account is twenty three. These are *Mahat* (1), *Ahaṃkāra* (1), *Indriyās* (5+5+1), *Tanmātrās* (5) plus *Mahābhūtas* (5).

According to the highly general picture of the *Sāṃkhya* school of Indian philosophy and Emanationism-II, the world consists thus of twenty four items. These fall into two groups. In the first group there is only one item, *Pradhāna*, from which everything else emanates but which itself does not emanate at all. In the second group belong twenty three items which emanate from the First cause; yet there are only some five stages in the entire course of the 'process' of emanation from the first to the last item. This may suggest that in the account of the *Sāṃkhya* emanationists both vertical and horizontal emanations were admitted from the beginning. In some schools of Neoplatonism the need was felt to add a horizontal emanation to the original and generally accepted vertical emanation.

Though this parallelism is there, it seems that there are some differences of detail. What corresponds in *Sāṃkhya* philosophy to the horizontal emanation of the Athenian school of Neoplatonism or in the system of Proclus is better described as simultaneous emanation or concurrent emanation.

The answer to the question why Emanation begins at all depends on the very nature of that process. One characteristic answer to that question, which states: "... nor is any justification of why the One had to become multiple, necessary", bears reference to and is based on, the generally accepted view that Emanation is an involuntary, unconscious and natural process. It seems the implication is that no further explanation is available; things are the way they are, and that is the end of the story.

Let us reformulate the question: What in the nature of the One makes it thus overflow? Or perhaps, What is it in the nature of the One or

of *Prakṛti*, in virtue of which entities can emanate from it or out of it? What causes the first ever cause to be activated at all?

Emanation is an explanation of, or accounting for, the fact that the First Principle yields the universe. But it does not really tell us why. In Neoplatonism the One is ambiguously described as utterly undetermined, so much so that nothing whatever can be said about it. We cannot even predicate Being to the One. It is ineffable. The One is absolutely undifferentiated, and all multiplicity falls outside of it. In this sense it is simple.

If these are indeed the characteristics of the One, how can it overflow at all? We will return to this question after we hear what the Emanationists have to say in answer to the second question. Then we shall consider the *Sāṃkhya* Emanationist-II answer to the same questions.

Certainly neither Emanationism nor the doctrine of the One arose in a vacuum. There was a historical discussion and development that led to these answers. Plotinus certainly knew the Stoic emphasis on unity and the Epicurean emphasis on plurality. He knew the Pre-socratic and Neo-Pythagorean teachings on these issues. The problem of the One and the Many dominates the entire gamut of Greek philosophy. Emanationism as one possible way of reconciling the One and the Many is certainly better than Creationism, in any case.

The Neoplatonist would find the excessive transcendentalism of the Christian doctrine of Creationism its most objectionable feature. The *Sāṃkhya* or Emanationist-II objection is somewhat different. They probably never knew of the Christian doctrine of Creation. In the *Vaidika* or *Vedic* tradition, creationism is seldom advocated. The principal objection to all *Arambhavāda*, the Indian equivalent of Creationism, is its doctrine of causality. *Parināmavāda* conceives the One as transforming itself into the Many which is not what Creationism holds. The *Satkāryavāda* of *Sāṃkhya* Emanationism-II insists on the whole that the effect is somehow already in the cause. This should be acceptable to Neoplatonism as well. All schools of Neoplatonism seek to steer a middle course between absolute transcendence and total immanence in the relation between the One and the Many.

There are a number of other parallel points between the Emanationism of *Sāṃkhya* and that of most Neoplatonist schools. They both agree that the Many has to come from the One. The One must, however, yield the many without suffering any loss, remaining

undiminished. They also agree that the notion of causation or emanation must remain an involuntary process, not needing any particular form of willing or action at any given time, either at the beginning, or at any subsequent stage of the process, on the part of the One.

Let us now come back to our second question: "What in the nature of the One makes it emanate into the Many?". The *Sāmkhya* Emanationism-II answer to that question seems more clear and straightforward. If the process by which the Many comes forth from the One is to be understood in a way that is not totally mystical, there is no alternative to avoid admitting that there is some first principle which transforms itself into the Many.

*Sāmkhya* holds that non-conscious material entities alone can undergo transformation. Conversely, if an entity is not subject to change in principle, it cannot be material. Thus it is in the very nature of material entities to undergo change and transformation, though matter itself, when regarded as pure matter as such, would be simple and therefore unchanging. This is corroborated by our daily experience. A physical entity, be it mountain or mustard seed, a living organism like the human body or some inorganic substance, undergoes slow or fast, perceptible or imperceptible change. This is not so with Consciousness. Mental states do change in us; that means only that one mental state is replaced by another. But no given conscious state changes or transforms itself into another.

So if the One is to change itself in order to become the Many, then the One would have to be regarded as material or non-conscious. The *Sāmkhya* philosophers say not only that the process of Emanation-II is non-conscious, but also that the emanating principle, the *Pradhāna*, is itself non-conscious. They go on to say that the reason why consciousness cannot change is that it is essentially simple, indivisible and without parts. On the other hand, material entities are not simple, they are complex and therefore essentially subject to change.

The logical consequence of all this is that the *Sāmkhya* One or *Pradhāna* must always be in a state of transformation. The process of emanation must have neither beginning nor end. That process will be as eternal as the *Pradhāna*. *Sāmkhya* accepts this logical consequence.

Does the acceptance of this consequence cause anomalies and inconsistencies in the *Sāmkhya* system? Here is the point at which *Sāmkhya* Emanationism-II and Neoplatonist Emanationism-I disagree with each other. Perhaps it is a point for dialogue between the two cultures

and their differing conceptions of Emanation. Such a dialogue may turn out to be of mutual benefit.

A related question is: If both the Primordial Stuff and the Principle of Emanation are thus non-conscious, and nothing more is needed to account for the multiplicity, why bring in the Conscious Principle at all? If the argument so far is correct, then the First Principle cannot be Consciousness, for Consciousness cannot transform itself, and multiplicity cannot be derived from it.

No conscious principle is necessary to activate the Unconscious First Cause to yield the things in the world of multiplicity. Why do *Sāmkhya* Emanationists as well as Neoplatonist Emanationists insist that the principle of emanation should be non-conscious? One argument discussed already is that if it is not in the very nature of the primordial stuff to emanate, then the existence of this world would be a matter of mere 'accident'. On the other hand, if the very nature of the *Pradhāna* or the One is to transform, then Emanationism-II is simply another name for this natural process of the One or *Pradhāna* transforming itself continuously, uninterruptedly and without interference from or intervention by an Other.

This elimination of consciousness, or any conscious principle, does not arise from any prior commitment or from any reductionist zeal. It is simply that there is no need for introducing consciousness as an explanatory principle for the multiplicity that exists. This is an important point to note. Emanationism-II is neither materialistic nor spiritualistic. And for that reason there may be place in it for consciousness.

As a matter of fact, both Emanationism-I and Emanationism-II do admit consciousness. One reason given by Emanationism-II is that the world of ordinary experience does contain both material things and consciousness. This fact has to be recognized and accepted. It is not possible for Consciousness to emanate or arise at a later stage from the *Pradhāna*. For unlike Evolution, the principle of Emanation is that it cannot give rise to anything that is not already there in the One or the First Cause. Otherwise the One would not be full; it would be less than the multiplicity. Both schools of Emanationism admit that the One is, and must remain, full and undiminished.

The *Sāmkhya* philosophers find here an argument to abandon Monism. They argue that, there must exist, side by side with the one eternal, material and transforming principle the First Cause or

*Pradhāna* another Principle of Consciousness. This principle they call *Purusa*. This must also be eternal; for it cannot come from *Pradhāna*, and there is no other source from which anything can come.

Consciousness is what it is by nature; its nature, however, is the opposite of *Pradhāna*. Because it is nonmaterial, its nature is not to change. Therefore it is outside the process of emanation, which is after all a process of change and transformation. The *Pradhāna* and the *Purusa* are distinct realities; neither of them originates in or emanates from the other. Neither needs, or is dependent on, the other. Thus in *Sāmkhya* there are two irreducible and eternal principles. One of them, the *Pradhāna*, is eternal, but changing or emanating, non-conscious. The other, *Purusa*, is also eternal, but conscious, non-emanating, unchanging, and the very Principle of Consciousness.

Why then should such a principle be introduced at all? The *Sāmkhya* answer is that there is no other way to account for the experienced fact of consciousness and mental states. Without that principle we could not even account for the existence of the *Jīva* or the experiencing soul; they are not only there as given, they are the very ones who raise and discuss these philosophical questions. If these empirical selves were just material, we could have accounted for them as arising from the *Pradhāna*, which is capable of giving birth to everything that is material. The *jīvas* are embodied souls, whose bodies alone could be accounted for as arising from the *Pradhāna*. But they are consciousness as well.

But even *Purusa* cannot, it may be said, explain the existence of the experiencing self. For the *Purusa* cannot cause anything. So *Sāmkhya* Emanationism-II posits yet another principle: that of the Witness. *Purusa* is above all the witnessing principle; it is this witness which enables us to posit the One or the Many which emanate from It. For all that emanates from the *Pradhāna* is material and unconscious. Further, *Purusa* has the capacity of being reflected in suitable matter, like, for example, the sun being reflected in water or in a mirror. In this case the reflecting medium for the *Purusa* is the very first item or hypostasis that emanates from the *Pradhāna*: the *Ahaṁkāra* or ego-consciousness, which is generically different from consciousness as such which knows no desire, change or transformation. The ego is thus not strictly speaking consciousness, but only a mirror for the true consciousness of the *purusa* who remains non-composite, therefore unchanging, inactive.

## Being and Knowing in Plotinus

Lloyd P. Gerson

The *fons et origo* of the ancient Greek philosophical association of being and knowing is a fragment of Parmenides' poem preserved for us by Clement of Alexandria and Plotinus:

...τὸ γὰρ αὐτὸ νοεῖν ἔστιν τε καὶ εἶναι.<sup>1</sup>

The interpretation of this fragment is of course exceedingly contentious.<sup>2</sup> If, as seems reasonable, we must seek to be guided in our interpretation of it by an attempt to locate its context in Parmenides' poem, then the best guess is that it is a continuation of fragment 2 whose last line is relatively unproblematic in meaning and can be translated "For you could not know that which is not (τὸ μὴ ὂν) (because that is not possible) nor could you express it." Then, fragment 3 would naturally be translated, "... because the same thing is there for thinking and for being," which would be an explanation of why it is not possible to know that which is not. We cannot know that which is not because we cannot think about it. No reason is given for *this* claim. Perhaps the reason underlying the interpretation expressed in the translation is that thinking is a relation between a thinker and (a) being and without one term of the relation, the relation itself cannot exist. But this certainly cannot have been Parmenides' reason, for in his account of being there can be nothing outside of being that stand in relation to it. This fact raises the serious question whether any authentically Parmenidean reason could be given for a claim interpreted to indicate a separation of thinking and being. And if there is no such reason, then fragment 3, even as a continuation of fragment 2, should perhaps not be such that it makes a claim that is insupportable on Parmenidean principles.

Outside the Eleatic school, Plato was the first philosopher to grasp the importance of the arguments of father Parmenides. He was evidently impressed both with Parmenides' account of being in general and also with the implication of that account for thinking. He seems to reject that account taken in the strongest sense in the first hypothesis of the second part of the *Parmenides*. Or a radically monistic interpretation of being, being cannot be known or thought about at all (142a). The rejection of radical monism is confirmed in the *Sophist* (244b-245e). For my purposes,

however, I propose to emphasize the positive lessons Plato learned from Parmenides rather than what he rejected. These lessons are incorporated into the middle and later dialogues with considerable subtlety.

The principal lessons are three: First, Eleatic monism can be shown to be false when one realizes that τὸ ὄν is complex. That is, whatever exists is really distinct from the existence it has.<sup>3</sup> This realization has two consequences: we can now legitimately talk about that which exists imperfectly, namely, the world of γένεσις, and we have to distinguish an ἀρχή of οὐσία from complex οὐσία itself, for if οὐσία is complex it cannot be the self-explaining source of being for everything else. Complexity presupposes simplicity, hence the ἀρχή of all must be beyond οὐσία, as Plato tells us in the *Republic* (509b6-10).

The second lesson regards the relation of being thus conceived to knowing. The ἀρχή of οὐσία is also the ἀρχή of knowability (τὸ γινώσκεσθαι) for that which is knowable, namely, οὐσία itself or the Forms.<sup>4</sup> Why should this be so? Why should the knowable as such require an ἀρχή that is "beyond οὐσία," as Plato says? Is it not enough that there be an ἀρχή of οὐσία and οὐσία itself be the ἀρχή of knowability? One might have supposed that the principle of knowability is finite structure or order or arrangement of parts and that is precisely what οὐσία represents. I would suggest, however, that just because to be knowable is to be complex in this way, the knowable requires a simple ἀρχή beyond it.

Consider a simple example illustrating this point. If a triangle is a three-sided plane figure, then knowing triangularity is a case of knowing that  $A = B + C$ .  $A = B + C$ , or more generally,  $A = D$ , is a representation or, in Platonic language, an image of perfect identity, that is,  $A = A$ . An image is relationally dependent upon its model. And this is what the ἀρχή of knowability is, the Form of the Good. Aristotle, and the entire Platonic tradition had no difficulty in surmising that Plato meant to identify the Good with the One. In this, Plato will have transformed what for Parmenides is the name of being into the ἀρχή of being.

The third lesson takes us back to the fragment of Parmenides' poem with which I began this paper and to Plato's interpretation of it. For Plato, a reasoned empirical judgment of the form "x is f" depends upon knowing what "f" is. I take it that this is the central point of Socratic questioning in the early dialogues. Knowing what "f" is or just knowing "f" is the paradigm of cognition. If the object of knowing is a finite structure or οὐσία, then there are two general alternatives for describing the state of mind of the knower. Either the mind is in a state representative of that structure or it is characterized by that structure itself, that is it is identified with it. It is clear enough that if these alternatives are mutually exclusive, then the first alternative cannot describe knowing for Plato. For

if the representation of the finite structure is other than it, as for example, in a symbolic representation, then knowing would not occur unless one already knew the object of the symbolic representation. Either the knower symbolically represents what he already knows, or all he knows is that the object of knowledge is symbolically represented by someone in some way. But then what is known is not that which is for Plato what is truly knowable. If, then, representation is excluded as the mode of knowing, which is intrinsically a plausible hypothesis for any pre-Lockean philosopher, then knowing is something like an identification of the knower with the structure known.

Plato does not of course give us an account of knowing that consciously contradicts representationalism. What he does do in a number of places is stress that a knower must be the same sort of thing as that which is known. In the so called affinity argument of the *Phaedo* (79a6-7), for instance, knowledge depends upon the soul being akin to that which is known. In the *Sophist* (248b6-9a2) τὸ παντελὸς ὄν is said to include νοῦς and hence soul and life.<sup>5</sup> That is, νοῦς possesses the same character as that which is really real. If at the time of writing either of these works Plato supposed that knowing could be representational, then these claims would be unnecessary. For if all that is wanted is a representation of a finite structure, then anything in the sensible world will do as a medium of representation. A body can represent beauty, say, or words or images can represent a truth. The reason why the soul must be made of the same sort of stuff as that which is known is that knowing a truth is not representing it. As Plato puts it in the *Philebus* (65d2-3), "νοῦς is either the same thing as truth or the most like it and the truest thing there is."<sup>6</sup>

If Plato means to make knowing οὐσία something that only that which has true being can do because knowing is some sort of identification of knower and known, then a Platonic interpretation of Parmenides' fragment suggests the translation: "thinking and being are the same thing."<sup>7</sup> This certainly has the virtue of being a literal translation of the Greek. Unfortunately, even if literalism were our only option, which it of course is not, I doubt that the interpretation suggested by this translation accurately represents Parmenides' thought. I also doubt that Plato thought it did. For the qualified identity of thinking and being, which the Platonic tradition infers to be Plato's doctrine on the basis of the dialogues, is inconsistent with monism. I do think, though, that Plato believed that Parmenides "made better," as in the dialogues *Parmenides* and *Sophist*, was in possession of a valuable insight. That insight is that the highest form of cognition, namely, knowing, is a state or activity that is properly also called the highest form of being. This is a much stronger claim than saying that "only that which is really real can know that which is really

real" or something similar. It is a claim that was to resonate down through the history of Greek philosophy.

Viewed from the Eleatic perspective, it is indeed strange that Aristotle should endorse the identification of being and knowing. That he does so on the basis of explicitly anti-Platonic principles indicates the strength of the claim. The manner in which he approaches their identification is instructive. For in the Book Lambda of the *Metaphysics* Aristotle identifies "the best *οὐσία*" with the highest form of cognition, *νόησις*, via *ἐνέργεια* (cf. 7.1072b3; 9.1074b20; 9.1074b34). The unmoved mover, putatively being in the primary sense, is identical with a pure activity which is nothing but *νόησις*. But because thinking by the best is always of the best, the unmoved mover is thinking of itself (1074b33-4). Thus, primary being is identified with self-reflexive thinking.

According to this claim, and Aristotle's doctrine of *πρὸς ἑν* equivocally, *οὐσία* in everything besides the unmoved mover is derived from it. But if to be in the primary sense is to think self-reflexively, then must not everything that has derived being also have derived self-reflexive thinking? It would seem so. One must not suppose that this conclusion can be avoided by saying that thinking is a property of primary being and so that what is derived to everything else is being but not the property of thinking. For if thinking were a property of primary being, then primary being would be in potency to its thinking. But it is the principal burden of the ninth chapter of the twelfth book of the *Metaphysics* to expunge every vestige of potency from being. That is why the unmoved mover cannot even be said to be a *νοῦς* as opposed to being *νόησις*, for if it were, it would be in potency to its thinking.

Nor of course can the conclusion be avoided by saying that thinking is just what perfect *ἐνέργεια* is, and so since nothing but the unmoved mover is perfect *ἐνέργεια*, nothing else can think! It is true that human thinking is imperfect, but it is also true that an animate nonsensate substance like a tree possesses *ἐνέργεια* imperfectly.

I do not think that Aristotle's position is hopeless, even on his own expressed principles. For he could interpret thinking in such a way that what the unmoved mover is said to do paradigmatically, even trees could be said to do derivatively. In other words, thinking is just an unimaginable *ἐνέργεια* in its perfect manifestation, as it is unimaginable in substances inferior to us. Of course, Aristotle represents the thinking of the unmoved mover as pleasurable and as the sort of activity in which we can share sporadically (7.1072b14-18). But these claims seem to be an extra-metaphysical excrescence on the main line of the argument. I mean that Aristotle need not have identified the unmoved mover with a thinker whose activity we can sporadically share in.

In support of this proposed refinement of Aristotle's position, the perfect self-reflexivity of the unmoved mover's thinking might seem to be that which ordinary thinking only approaches asymptotically. For there is no intentionality in it. There is no complexity in it sufficient to differentiate a thinker and an object of thought. Nevertheless, as Plotinus will argue, the conclusion that we should draw from this is not that perfect thinking is perfect *ἐνέργεια* but that since perfect thinking is essentially intentional, the unmoved mover, if it is a *νοῦς* or even it is just *νόησις* cannot be perfect *ἐνέργεια*.

Apart from the travails of the unmoved mover, Aristotle in *De Anima* explicitly endorses the anti-representationalism implicit in Plato's account of knowledge of Forms: "For in the case of objects without matter, that which thinks and that which is being thought are the same"<sup>8</sup> As it stands, this claim is ambiguous. It can either be interpreted to reject intentionality, as in the case of the unmoved mover, or to affirm it. In the former case, our thinking would be perfectly self-reflexive. But there is no reason for Aristotle to say this, and much evidence to indicate that he believed otherwise. In the *Metaphysics* (12.9.1074b34-5) he tells us that all forms of cognition are intentional, that is, "of something else" (*ἑτέρου*) and only incidentally of themselves. If this is so, how are that which thinks and the object of thought the same?

Perhaps the argument is as follows. If thinking is identification with an intentional object, then in thinking about one's thinking about that intentional object, the thinker has himself indirectly as an object of thought. This might mean that he comes to know that he is a thinker, the sort of thing that can identify with an intentional object.<sup>9</sup> It is reasonable enough that in thinking, the thinker should come to recognize that it is capable of doing just the sort of thing it is doing. But it is difficult to see how this interpretation explains the identity of the thinker with an intentional object other than it. It would seem that if one thinks of oneself indirectly in thinking of the intentional object, then one is precisely not identical with that direct intentional object.

Evidently, Aristotle's solution to this problem is to apply his account of perception to thought and to say that the intentional object and the thinking of it are one in *ἐνέργεια* but differ in essence.<sup>10</sup> This is a special case of the more general principle that in efficient causality the *ἐνέργεια* of the agent and the patient are one but not in essence.<sup>11</sup> Thus, for example, an act of teaching and an act of learning are the same *ἐνέργεια*, but the formula of each is different. Aristotle is apparently led by this analysis to infer that that which is one in *ἐνέργεια* but two in formula is an imperfect version of that which is both one in *ἐνέργεια* and one in formula, namely, the thinking that is the unmoved mover and

putative primary being. But if it turns out that that thinking is essentially intentional, then primary ἐνέπρετα cannot be thinking. And if explaining the relation between thinking and being means explaining it in its most perfect form, then we do not as yet have a proper account of being and thinking. One could say, for example, that thinking is intentional, but that this tells us nothing about the nature of being.

I turn now to Plotinus whose critical appreciation of Aristotle is practically unmatched in the history of philosophy. In his account of νοῦς and οὐσία, Plotinus aims to build a defense of Plato with Aristotelian material. He concurs with Aristotle in rejecting a representational theory of knowledge. He has Epicurus particularly in mind, but the gist of his argument is a general *reductio ad absurdum* of all versions of representationalism. If the intentional object of νόησις is other than the Forms themselves, then νοῦς will have to be able to compare the representation of the Forms in order to know that they are accurate. If it can compare them, it does not need the representation in the first place. If it cannot, then eternal truth is not guaranteed. For the eternal judgments in νοῦς will be judgments whose contents are other than eternal being.<sup>12</sup> Plotinus is here arguing for the claim that truth is not something possessed, where possession is understood as a representational state. So long as truth is agreed to be being in relation to intellect, the only alternative to representationalism of any sort is identity.<sup>13</sup>

Plotinus' claim that eternal truth implies an eternal νοῦς actually has enormous anti-Aristotelian implications. First, it implies that the primary ἀρχή of all is not a knower, for that ἀρχή in its perfect simplicity cannot possess the complexity that knowing requires. Second, as we shall see, the identification of νοῦς with οὐσία is refined in the light of the limitless existence of the One. Third, representationalism is resurrected in order to account for modes of cognition inferior to that of eternal νοῦς. Even the highest form of cognition in an incarnate νοῦς is only an image of the cognitive life of its discarnate paradigm. These anti-Aristotelian implications need to be stressed for it is sometimes supposed even by those sympathetic to Plotinus that his metaphysics is but an embellishment or continuation of its Aristotelian antecedent.

In the remainder of this paper I should like to focus on the second point, Plotinus' reconstruction of the account of being in the light of the account of eternal truth and its subordination to the first principle of all, the One.

Eternal truth is supposed to entail the existence of eternal νοῦς. The entailment is supposed to hold because eternal truth is complex, whereas the One is simple, and the complexity of cannot be grounded in a mere multitude of unconnected beings or Forms. Even eternal existential

truths express a connection among Forms. Thus, eternal truth is being for an intellect. But this is construed, on Aristotelian grounds, as the being of an intellect. To have νοῦς "looking in at Forms from the outside" would be to concede that νοῦς is irrelevant to the existence of eternal truth. It is not enough, though, to "internalize" the Forms in νοῦς. Plotinus cannot allow that knowing is different parts of a complex whole related to each other.<sup>14</sup> For what would be in the knowing part would be different from what the other part is. Thus, the requirement that eternal νοῦς exist in order to ground truth leads to the requirement of a particular conception of thinking or knowing. According to this, self-knowing is knowing in the proper sense. But this self-knowing is somewhat more problematic than it is in Aristotle's paradigm case, for intentional complexity is not removed from it.

How is this self-knowing then to be understood as knowing Forms? It is to be understood as the claim that there is no conceptual distinction between knowing and knowing that one is knowing.<sup>15</sup> Thus, sKp and sKsKp are mutually implicative, where "s" is νοῦς or a νοῦς, "K" is the activity of knowing (νοεῖν), and "p" is not a proposition but οὐσία or the complex whole containing all the Forms. One difficulty here would seem to be that if in sKp "p" is not to be construed as a proposition, in sKsKp "sKp" must be so construed. That this is not so follows from the fact that if "sKp" is different in content from "p", then self-knowing is regressive rather than reflexive as it must be if knowing (Forms) is self-knowing. For if sKp entails sKsKp but "p" is an intentional object different from sKp, then knowing "p" is different from knowing sKp, and the identity of subject and object of knowing would involve a vicious expansion of the object of knowing.

Many philosophers from widely different backgrounds believe that sKp and sKsKp are mutually implicative. Many fewer interpret this implication as a characterization of self-evidence such that for s, sKsKp is sufficient evidence for p. Thus, knowing would entail certainty or infallibility. Knowing requires sufficient evidence. The only sufficient evidence for "p" that "s" could adduce without initiating an endless regress would be the claim that sKsKp. "s" knows "p" if and only if "p" is self-evident to s. Plotinus is among the philosophers who believe that knowing thus implies certainty.<sup>16</sup> But few philosophers accept the further implication that the self-reflexivity of self-evidence is only possible if intellect is an immaterial entity.<sup>17</sup> For Plotinus, we might say that since νοῦς is immaterial, it naturally follows that knowing is essentially self-knowing. For knowing implies certainly and certainly can only obtain when there is self-reflexivity. More precisely, there is certainty about what is known non-inferentially only when there is self-reflexivity.

It would seem that owing to the condition that knowing is not representational, but an identification of knower and known, knowing cannot be essentially inferential. For inference requires a representational element of a logical connective and a judgment that A is so because of B. So, if the intellect is immaterial and if knowing in the primary sense is non-representational and non-inferential and certain, these conditions are accurately albeit elliptically contained in the claim that knowing is self-knowing. I think it is important to mention here in passing a point that we shall return to later. Plotinus' characterization of νοῦς does not depend on an appeal to our own experience, for we are not aware of the ἐνέργεια of separate νοῦς, neither our own nor that of the demiurge. He is not arguing that, say, infallible judgments about our own sense-experience indicate the immateriality of νοῦς or self-reflexivity as its essential property. For sense-experience is not an activity of νοῦς. And yet all forms of cognition inferior to that of νοῦς are potentially illuminated by their paradigm.<sup>18</sup>

From the identity of νοῦς and Forms and the mutual implication of σκῆψις and σκῆψις, Plotinus draws a conclusion that is unfortunately easy to misunderstand. He says that Forms themselves possess life.<sup>19</sup> This has been taken to mean that each Form, for example, the Form of Beauty, is itself a νοῦς. So Armstrong translates Plotinus' words καὶ ὅλος μὲν ὁ νοῦς τὰ πάντα εἶδη, ἕκαστον δὲ εἶδος νοῦς ἕκαστος, "And Intellect as a whole is all the Forms, and each individual Form is an individual Intellect."<sup>20</sup> This translation is inaccurate. The last clause is better rendered "and each form is each νοῦς." This text thus rendered only affirms the cognitive identity of each νοῦς with all Forms. It does not obliterate the distinction between νοῦς and Forms or that between the activity of thinking and its intentional objects. The supposed interpretation of the above text is not supported by the identity of νοῦς, νόησις, and τὸ νοητόν.<sup>21</sup> For as Plotinus says elsewhere, it is false to say that Forms are νοήσεις, if this is taken to mean that Forms are not prior to thinking of them or to mean that the Form is just the thinking.<sup>22</sup> On the contrary, we only need to take Plotinus as affirming Aristotle's point that νοῦς is intelligible in the sense that it is identical with intelligible cognitively, from which it follows that what is intelligible, i.e., each Form, is identical with every νοῦς.<sup>23</sup>

The identity of νοῦς with its objects requires the complexity of intentionality. Therefore, νοῦς and οὐσία are subordinated to the ἀρχή of all, which is what Plato explicitly holds in the *Republic* and Aristotle explicitly denies. Therefore, strictly speaking, we should not say that νοῦς is identical with being but that it is identical with what οὐσία actually stands for, namely, essence. The cognitive identity of νοῦς with οὐσία is not the paradigm of being, but the paradigm of complex unity, which everything else "below" νοῦς partakes of insofar as it is one and has an

essence. The ἐνέργεια of νοῦς, which is self-reflexive identification with its intentional objects is indeed the paradigm for all cognition. But we are not thereby forced to say that a molecule of water is thinking because it instantiates a Form. For the molecule partakes of νοῦς only insofar as it partakes of its eternal intentional objects. Since thinking is essentially intentional or bipolar, it need not be otherwise. Something does not have to be cognitive in some obscure way in order to be an image of a Form, even though all Forms are eternally identical with a mind.

When in V. 1.8 Plotinus quotes Fragment 3 of Parmenides and endorses what he takes to be Plato's interpretation of it, he says that Parmenides erred in believing that being is one, whereas in fact it is many. As the subsequent reference to Plato's dialogue *Parmenides* shows, Plotinus is not making the point that a plurality of things exists. Rather, he means that finite being or οὐσία is complex. This does not gainsay the unqualified unity of the paradigm of being, the One.

The identity of νοῦς and οὐσία also does not obliterate the logical priority of being to knowing.<sup>24</sup> Neither νοῦς nor the One produce οὐσία if its production is taken to imply logically the possibility that it should not be produced. The eternal dependence of οὐσία on the One and its eternal identity with νοῦς precludes mind-dependent idealism where this is contrasted with realism.<sup>25</sup>

Aristotle's hypothesis in the *Metaphysics* that being is οὐσία is disconfirmed when he identifies οὐσία with the ἐνέργεια of νοῦς (7.1072b26-7). For the ἐνέργεια of νοῦς cannot be perfect ἐνέργεια. It cannot be so because it is essentially intentional and therefore complex. A complex ἐνέργεια cannot be what being is itself because that which is complex has as its own ἀρχή that which is simple. If being were itself complex, consider what we would say about the simples of which it is composed. This last point is an authentic Eleatic insight that Plotinus rescues from the wreckage of extreme monism.

Once being is understood not to be οὐσία, the connection between οὐσία and νοῦς can be reconstructed. The identity of νοῦς and οὐσία need not be taken to imply that to be is to be a thought or a thinker. In this regard, Plotinian epistemological realism is what Aristotelian epistemological realism should have been. If we ask the Aristotelian question "what is being?" the Plotinian answer is being = ἐνέργεια instead of being = οὐσία.<sup>26</sup> Nothing in Plotinus more dramatically shows how he uses Aristotle to rehabilitate Plato than this answer, for the concept of ἐνέργεια does not even appear in Plato.

Once this move is made, an independent line of investigation is opened regarding the question of the eternal identity of νοῦς and οὐσία. There is no longer a need to posit an eternal νοῦς to account for eternal

motion. The Plotinian approach is rather to argue that eternal truth exists, but that it could not exist without eternal  $\nu\omicron\upsilon\varsigma$ . Those who agree that eternal truth exists, but deny that an eternal  $\nu\omicron\upsilon\varsigma$  exists which is cognitively identical with Forms must say either that eternal truth can exist without such identification or that these truths are in fact identical with the One, which is beyond  $\nu\omicron\upsilon\varsigma$ .

Plotinus' response to both possibilities amount to the same thing. Since the One is the cause of the being of everything, it follows that the One is virtually all things, that is, it has the power to cause all things to be, including Forms.<sup>27</sup> But it does not follow from this that the One is *eminently* all things, that is, among other things, the perfect instance of eternal truths. Plotinus cannot say this because that would compromise the simplicity of the One.

Let us recognize that Plotinus does actually say that the One has all Forms in it "indistinctly" ( $\mu\eta\ \delta\iota\alpha\kappa\epsilon\sigma\tau\iota\mu\acute{\epsilon}\nu\alpha$ ).<sup>28</sup> In fact, the reason given for the One's having the ability to give existence to everything is just that it has everything in it "beforehand." But this claim must be balanced by another sort, according to which "there is no necessity for something to have what it gives" and "the Form is in that which is shaped ( $\nu\omicron\upsilon\varsigma$ ), but the shaper was shapeless."<sup>29</sup> If the indistinctness of the Forms in the One were intended to represent a state prior to a temporal creation, then Plotinus would I think have to say that the One is *eminently* as well as *virtually* all the Forms, in which case his position would not be substantially different from that of, say, Aquinas. But since  $\nu\omicron\upsilon\varsigma$  is eternally caused to be by the One, its having the Forms "indistinctly" should not be understood in this way.<sup>30</sup> Rather, as Plotinus tells us, to say that the One is none of the Forms means that they are "later ( $\u03c5\sigma\tau\epsilon\rho\alpha$ )" than it, but to say that the One is all of them means that they "come from it ( $\epsilon\chi\ \alpha\u03c5\tau\omicron\upsilon$ )."<sup>31</sup> The Forms are later in the sense that they are an effect of which the One is the cause, though *what* they are is uncaused.<sup>32</sup> The phrase "come from it" is difficult, but it cannot indicate a process of emptying where the result is that something is *outside* the One, for there is no such thing. I would suggest that the phrase "come from it" indicates the result of  $\nu\omicron\upsilon\varsigma$ 's contemplation of the One under the aspect of the Good. That is, when  $\nu\omicron\upsilon\varsigma$  achieves the Good it does so by contemplating all the Forms.<sup>33</sup> So the indistinct existence of Forms in the One does not indicate another mode of being for Forms, much less a superior mode of being.<sup>34</sup> It indicates that the eternal achievement of goodness for  $\nu\omicron\upsilon\varsigma$  requires that it go beyond itself to the Good itself, but that this amounts to identification with all the Forms in contemplating.<sup>35</sup>

Another reason why the One cannot be *eminently* all the Forms is that a paradigm is really related to its images. As Plato tells us in the *Parmenides* (132d), we can consider a Form and its image "insofar as they

are like" and this surely indicates a real relation. But Plotinus says that the One is related to nothing. Hence, it cannot be a paradigm, which it must be if it is *eminently* all Forms.

The only way that the One can be *virtually* all the Forms but not *eminently* all the Forms as well is by positing eternal  $\nu\omicron\upsilon\varsigma$ . For it is  $\nu\omicron\upsilon\varsigma$ 's relation to the One under its aspect of the Good that is the instrument of the creation of eternal truth.<sup>36</sup> Why should it not have been the case that the diffusion of the infinite goodness of the One results in eternal Forms but not eternal  $\nu\omicron\upsilon\varsigma$ ? Why is it necessary, as Plotinus puts it, that  $\nu\omicron\upsilon\varsigma$  is generated from the One?<sup>37</sup>

This is an unusually difficult question to answer. It is not satisfactorily answered by saying, as Plotinus does, that  $\nu\omicron\upsilon\varsigma$  is "closest" to the One, so that when the One produces it produces  $\nu\omicron\upsilon\varsigma$ . "Closest" here means that the complexity of  $\nu\omicron\upsilon\varsigma$  is least removed from the simplicity of the One. That is,  $\nu\omicron\upsilon\varsigma$  is closest to being one that a complex thing can be. Thus,  $\nu\omicron\upsilon\varsigma$  is called  $\epsilon\nu\ \pi\omicron\lambda\lambda\acute{\alpha}$ .<sup>38</sup> But I think there is a hint here of a more profound answer.

Consider the putative eternal truths "three is odd" or "fire is hot." The Platonist must explain these truths as grounded in Forms. But how are, say, the Forms of three and odd related eternally? The history of Platonic answers to this question is part of the history of the doctrine that Forms are ideas in the divine mind. Plotinus is too good of a philosopher to be satisfied with the typical naive interpretation of this claim. He sees that Forms must be distinct yet somehow identified.<sup>39</sup> Distinctness and identification are not here contradictory. The identification of Forms is a cognitive activity, as is the "separating" of them. In fact, Plotinus distinguishes two kinds of  $\nu\omicron\upsilon\varsigma$ ,  $\delta\ \mu\acute{\epsilon}\rho\iota\zeta\omicron\nu\ \nu\omicron\upsilon\varsigma$  and  $\delta\ \alpha\mu\acute{\epsilon}\rho\iota\sigma\tau\omicron\varsigma\ \nu\omicron\upsilon\varsigma$ , engaged in such activity.<sup>40</sup> The judgment made by dividing  $\nu\omicron\upsilon\varsigma$  that "three is odd" involves concepts and is in time. It is a representation of what "undivided  $\nu\omicron\upsilon\varsigma$ " does. "Three is odd" could not be an eternal truth unless there existed an eternal mind making the identification.<sup>41</sup>

Perhaps I can make this clearer in the following way. Eternal truths for Plotinus are of the form  $A = B$ , not of the form  $A = A$ . This is sometimes obscured by uncritical characterizations of the  $\acute{\epsilon}\nu\epsilon\rho\gamma\epsilon\iota\alpha$  of  $\nu\omicron\upsilon\varsigma$  as non-propositional. The formula  $A = B$  cannot stand for anything real, if by "real" we mean extra-mental or non-cognitive. For the real world tells us, as Bishop Butler said, that "a thing is what it is and not another thing." One who identifies eternal truth with a simple  $\acute{\alpha}\rho\chi\eta$  is content with this. Plotinus is not because he does not. Complex eternal truth could only be *for* a mind that is making the identification of A and B eternally. Add to this claim the Aristotelian claim that mind is cognitively identical with what it knows and we arrive at the Plotinian conclusion:  $\mu\iota\omicron$

μὲν οὖν φύσις τό τε ὄν ὅ τε νοῦς.<sup>47</sup> Without νοῦς there could be Forms, but there could be no truth.

## Endnotes

1. This is usually given as fragment 3, indicating a continuation of line 8 of fragment 2. Clement of Alexandria, *Stromata* U.440.12 and Plotinus, *Enneads* V.1.8.17, 1.4.10.6, and IR.8.8.8 preserve the fragment but do not suggest its relative location in the rest of the poem.
2. For discussion of the problems and possibilities see L. Taran, *Parmenides* (Princeton University Press: 1965), 41-44; D. Gallop, *Parmenides of Elea* (University of Toronto Press: 1984), 8.
3. Cf. *Sophist* 245d4-6: ὥστε οὐτε οὐσίαν οὐτε γένεσιν ὥς οὖσαν δεῖ προσαιγορεῦειν [τὸ ἐν ἡ] τὸ ὅλον ἐν τοῖς οὖσι μὴ τιθέντα. The wholeness referred to here is the complexity of that which is, whether it be οὐσία or γένεσις. The second hypothesis of the *Parmenides* makes the same point at 142b6-8: ἄρα οἷόν τε αὐτὸ εἶναι μὲν, οὐσίας δὲ μὴ μετέχειν, —Οὐχ οἷον τε.—Οὐκοῦν καὶ ἡ οὐσία τοῦ ἐνὸς εἴη ἂν οὐ ταύτων οὖσα τῇ ἐνὶ οὐ γὰρ ἂν ἐκείνη ἦν ἐκείνου οὐσία. The words οὐ ταύτων referring to "one" and οὐσία indicate the real distinction.
4. It is evident from 510a9 that τοῖς γνωσκομένοις of 509b6 refers at least to that which is νοητόν (cf. 509d4), which I take it is primarily the Forms.
5. *Republic* 510b is also relevant in its insistence that the mode of cognition that is the highest part of the divided line must proceed "without images."
6. There is another somewhat more indirect piece of evidence for this interpretation from the *Timaeus*. At 30d1-2 the demiurge is said to make the world according to the "noblest among the things which are intelligible" and at 37a1-2 the demiurge itself is said to be "the best of the eternal intelligible." The clear implication is that there is some sort of identity between demiurge and Forms.
7. It is clear from the passage in which Plotinus cites the fragment (V.1.8.15-17) that he interprets Parmenides in this way and that he believed Plato held the same view, that is, he believed that Plato interpreted Parmenides thus and that Plato thought that the claim thus interpreted is true.
8. *De Anima* 3.4.430a3-4. Cf. 7.431b17.
9. So R.D. Hicks, *Aristotle's De Anima* (Cambridge: Cambridge University Press, 1907), 485, and 429b9 where Aristotle says that only when an intellect becomes an intelligible object is it capable of thinking itself.
10. Cf. *De Anima* 2.2.425b26-7: ἡ δὲ τοῦ αἰσθητοῦ ἐνέργεια καὶ τῆς αἰσθήσεως ἡ αὐτὴ μὲν ἐστὶ καὶ μία, τὸ δ' εἶναι οὐ τὸ αὐτὸ ἀνταῖς. By contrast, Plotinus, V.1.8.8, will say that thinking and object of thought are one ἐν οὐσίᾳ.
11. *Physics* 3.3.202a20.
12. Cf. V.5.1.19-21. In this passage, Plotinus uses the Epicurean term τύποι for the putative impressions or representations in νοῦς. I take it the argument is

generalizable whatever the exact of the representations, so long as they are distinct from Forms. At line 55 he uses the more general term εἶδωλα.

13. Cf. III.5.7.50-3; III.9.1.6-10; V.3.5.21-9; 13,12-14; V.4.2.44-6; V.5.1.19-23; V.9.5.7-8; VI.6.7.8-10; VI.7.41.12-13. At V.5.2.8 Plotinus characterizes the identification as a kind of "fusing" (συγκροθέντως) with Forms. This indicates well the real identity of that which is nevertheless distinct.

14. Cf. V.3.5.17-23; V.5.1. Cf. J. Pepin, "Elements pour une histoire de la relation entre l'intelligence et l'intelligible chez Plato et dans le neoplatonisme," *Revue Philosophique de Louvain* 53 (1956): 54-5 and R.T. Wallis, "Scepticism and Neoplatonism," in W. Haase and H. Temporini (eds.), *Aufstieg und Niedergang der Römischen Welt Teil 11: Bd. 36.2* New York: Walter De Gruyter (1987): 922-5 on the skeptical background of this argument Sextus Empiricus, *Against the Logicians* 1.310-312, states the dilemma faced by those who hold that cognition is an identification: "For if the mind apprehends itself, either it as a whole will apprehend itself, or it will do so not as a whole but employing for the purpose a part of itself. Now it will not be able as a whole to apprehend itself. For if as a whole it apprehends itself, it will be as a whole apprehension and apprehending, and, the apprehending object will no longer be anything; but it is a thing most irrational that the apprehending subject should exist while the object of the apprehension does not exist. Nor, in fact, can the mind employ for this purpose a part of itself. For how does the part itself apprehend itself? If as a whole, the object sought will be nothing; while if with a part, how will that part in turn discern itself?"

15. This is most clear at II.9.1.36-9; 46-54. Cf. V.3.1.15-28. The passage at II.9.1.53-4 ends: τίς χωρὰ τῇ ἐπειροῖα τῇ χωρίζουσι τὸ νοεῖν ἀπὸ τοῦ νοεῖν ὅτι νοεῖ; this would seem to indicate an absence even of conceptual distinctness between knowing something and knowing that one is knowing something. But if this is so, then the only way we can preserve distinct knowers is to say that "p" as known by "s" has some different quality from the way "p" is known by "r". Thus, "s" knows "p" in a unique manner or from a unique perspective. This fact does not, however, entail an obliteration of the distinction between subject and object. If it did, there would be no reason for denying Aristotle's claim that νοῦς is unqualifiedly actual. Cf. J. Hintikka, *Knowledge and Belief* (Ithaca, N.Y.: Cornell University Press, 1962), 103-25, for a useful survey of various versions of the claim that knowing "p" and knowing one knows "p" are mutually implicative.

16. V.5.1.1-2: Τὸν νοῦν, τὸν ἀληθῆ νοῦν καὶ ὄντως, ἀπ' ἃν τις φαίη ψεύσεσθαι ποτε καὶ μὴ τὰ ὄντα δοξάσειν, cf. VI.2.8.2-5 where the infallibility of νοῦς is explained by saying that the being of the object of thinking is just its being thought. With this passage should be read V.6.6.24-7 where Plotinus distinguishes "man" and "thought of man," "horse" and "thought of horse," etc. We can reconcile these two passages if we say that "man" and "thought of man" are

distinct according to a real minor distinction in the latter passage, though in substance they are identical. Cf. Pepin (1956:49-50).

17. Proclus, *The Elements of Theology*, prop. 15 in (Dodds, ed. Oxford: Oxford University Press, 1963), states this with utmost clarity. Since a material entity has parts outside of parts, there could never be literal self-reflexivity (πρὸς ἑαυτὸ ἐπιστρέφειν) in it. Cf. the commentary of Dodds (202-3) on this passage with references.

18. V.3.4.1-4 seems to contradict this when it says that we are in accord with νοῦς in two ways: "either by having something like its writing written in us like laws, or by being as if filled with it and able to see it and be aware of it as present." The "laws" are evidently concepts. I think that the second way we are in accord with it need only mean that we are aware that νοῦς exists and is active, without our actually engaging in that activity. For how could we engage in that activity while in time and without being aware of all the Forms at once? There is no conceptual space in Plotinus' system for incomplete identification with οὐσία.

19. For Plotinus the most important association of life with Forms is of course to be found in Plato's *Sophist* 248e. Cf. IV.7.9.24; V.4.2.43; V.5.1.33ff; V.9.8.1-8; VI.2.20. Cf. Hadot (1960:108-9). That each Form is an intellect means that the world of Forms is in fact also a community of distinct intellects. Cf. IV.3.5.6-8: ἐπεὶ κακεῖ οἱ νόες οὐκ ἀπολούνται, ὅτι μὴ σωματικῶς μεμερισμένοι, εἰς ἓν ἀλλὰ μένει ἑκάστος ἐν ἑτερότητι ἔχον τὸ αὐτὸ ὃ ἐστὶν εἶναι. W. Himmerich, *Eudamonia, Die Lehre des Plotin von der Selbstverwirklichung des Menschen* (Würzburg, K. Triltsche, 1959), 50 cites III.2.16.17-20 where Plotinus says that πᾶσα δὲ ζωὴ ἐνέργεια. In connection with this statement Himmerich argues, Plotinus employs Aristotle's principle that actuality precedes potency to conclude that primary life has primary ἐνέργεια. This is not strictly true because the One is primary ἐνέργεια. Cf. VI.8.20.9-16. Also, III-8-8.8; V.1.8.17; V.3.5.26; V.6.6.21; V.9.5.29; VI.6.2.9; VI.7.40.15 on the identification of thinking and object thought. As H.R. Schwyzer, *Plotinos in Pauly-Wissowa RE-Sonderausgabe* (Munich: 1978), 553-4, points out, Plato nowhere implicitly identifies νοῦς and οὐσία but this is a natural inference from *Republic* 507b, 509b, and 509b.

20. V.9.8.3-4. Ciletti's translation is not so misleading, "E, precisamente, nel suo complesso lo Spirito è il complesso delle forme; ma la forma nella sua singolarità è lo Spirito preso come singolo." Similarly, but more literally Bréhier, "L'intelligence complète est faite de toutes les idées, et chacune des idées, c'est chacune des intelligence" and Harder-Theiler, "Und zwar ist der Geist als Gesamtheit alle Ideen, die einzelne Idee aber ist der Geist als einzelnes . . ."

21. V.3.5.44-5.

22. V.9.7.14-17: ὁθεν καὶ τὸ λέγειν νοήσεις τὰ εἶδη, εἰ οὕτω λέγεται ὡς, ἐπειδὴ ἐνόησε τότε ἐγένετο ἢ ἐπὶ τότε, οὐκ ὁρθῶς καὶ οὕτως γὰρ τῆς νοήσεως πρότερον δεῖ τὸ νοούμενον εἶναι. D. Roloff, *Plotin Die Grosschrift* III.8-v.8-v.5-II.9 (Berlin, Walter de Gruyter, 1970), 18 commenting on III.8, where Plotinus

explains how thinking and being are identical and νοῦς is true life, says: "Der Geist ist als Subject zugleich das intentionale Object, wie dieses umgekehrt zugleich Object denkende-Subject ist." Cf. 51. Against this view, I hold that the Forms are intentional objects of νοῦς and that self-reflexivity means the subject thinking the subject thinking the intentional object, thereby maintaining the distinction between subject and intentional object. For at VI.2.8.4-5 Plotinus says ὁ δ' ἔστιν ἄνθρωπος, εἰ νοήσεται, τοῦτ' ἔστιν αὐτοῖς τὸ εἶναι.

23. Cf. *De Anima* 3.4.430a1-2. G. Huber, *Das Sein und das Absolute. Studien zur Geschichte der ontologischen Problematik in der spätantiken Philosophie* (Basel: Verlag für Recht und Gesellschaft argues that in the "Spiritualisierung des Eidos" Plotinus develops an idea beyond anything explicit in Plato or Aristotle. I think this is true only in that Plato is not explicit on the cognitive identity of νοῦς and Forms and for Aristotle, cognitive identity of νοῦς and its objects is not identity with Plato's Forms.

24. Cf. VI.5.6.5-10, 31-3; οὐ γάρ, ὅτι ἐνόησε τί ποτ' ἔστι δικαιοσύνη, δικαιοσύνη ἐγένετο, οὐδ' ὅτι ἐνόησε τι ποτ' ἔστι κίνησις, κίνησις ὑπέστη (8-10). Cf. also V.9.7.11-12; VI.2.8.14-16; VI.2.19.18-21; VI.7.8.4-8. Plotinus is probably making use of *Parmenides* 13 2b7-10 where it is argued that τὸ νοούμενον is prior (logically, though the text is not explicit) to a νόημα of it. Cf. VI.7.40.6: νόησις πᾶσα ἐκ τινὸς ἐστὶ καὶ τινός. V.4.2.6-7: ὁρίστος μὲν αὐτῇ [νόησις] ὥσπερ ὅψις, ὁρίζομένη δὲ ὑπὸ τοῦ νοητοῦ. In V.2.1.12-3 the logical priority of τὸ ὄν to the "gaze" [ὄρα] upon the One is clear. It is tempting to gloss τὸ ὄν with τοῦ νοητοῦ above. The explicit identification of the objects of νοῦς with Forms is made at V.9.8.1-4. Cf. I.6.9.41-2; VI.7.15.9-13. H. Oosthout, *Modes, of Knowledge and the Transcendental. An Introduction to Plotinus' Ennead 5.3 [491]* (Amsterdam, B. R. Grüner, 1991), 68, puzzlingly, argues against the logical priority of being to knowing, even though earlier (64) he asserts it.

25. This is most clearly brought out at VI.7.8.3-8: But supposing [νοῦς] discovered the thought of horse in order that a horse (or some other animal) might come into being here below? Yet how would it be possible for him when he wanted to make a horse to think a horse? For it is already clear that the thought of horse existed if he wanted to make a horse; so that it is not possible for him to think it in order to make it, but the horse which did not come into being must exist before that which was to be afterwards.

26. VI.8.20.9-15. Cf. V.4.2.35; VI.8.7.46-8; VI.8.12.22-3; VI.8.13.6-8; VI.8.16.15, 25, 30, 31, 35 and Krämer (1966: 12-13).

27. On the One as δύναντος of all things cf. V.3.15.33. Also, III.8.10.1; V.1.7.9-10; V.3.16.2; V.4.1.24-5, 36; V.4.2.38; V.5.12.38-9; VI.7.32.31; VI.7.40.13-14; VI.8.9.45; VI.9.5.36-7.

28. V.3.15.31. Cf. V.2.1.1; V.4.2.16; VI.7.32.14; VI.8.21.24-5.

29. VI.7.17.3-4, 17-18.

30. G. Leroux, *Plotin. Traité sur la liberté et la volonté de l'Un* [Ennéade VI,8 (39)] (Paris: J. Vrin, 1990), 96, 108, seems to unpack the metaphorical representations of the One in terms of eminence, a position that is in conflict with his basic thesis that the simplicity of the One entails its impersonal nature.

31. VI.7.32.13-14. Cf. V.5.12.41.

32. Cf. VI.7.2.40-3: εἰ οὖν μὴ ἔχει (the Forms) αἰτία τοῦ εἶναι, αὐτοάρκη δὲ ἐστὶ καὶ μεμονωμένα αἰτίας ἐστὶν, εἴη ὅν ἐν αὐτοῖς ἔχοντα σὺν αὐτοῖς τὴν αἰτίαν. Also, VI.7.17.6-9; VI.7.40.21-4. Cf. C. Rutten, "La doctrine des deux actes dans la philosophie de Plotin," *Revue Philosophique* 146 (1956): 104-5 and J. Bussanich, *The One and its Relation to Intellect in Plotinus* (Leiden: E. J. Brill, 1988), 163-5.

33. V.6.5.8-9: καὶ τοῦτό ἐστι νοεῖν, κίνησις πρὸς ἀγαθὸν ἐφ' ἑαυτὸν ἐκείνου. Cf. VI.7.15.11, 16. At V.4.2.4, 12, 13 Plotinus seems to hold that the One is intelligible [νοητόν]. On my interpretation, the One is called νοητόν here because the good is achieved by νοῦς by contemplating, that is, having an intelligible object. At 3.8.9.10-11 Plotinus denies that the One is intelligible. The assertion and denial that the One is νοητόν are parallel to the statements that the One does and does not contain all the Forms and should be interpreted accordingly. I believe this interpretation helps explain why in the notorious text at V.1.7.54 Plotinus should not be taken to be saying that the One looks at itself by turning back upon itself and in this way produces νοῦς. The generation of νοῦς in this passage refers to the achievement of νοῦς in identifying itself with what the One virtually is, all Forms. So G.J.R. O'Daly, *Plotinus' Philosophy of the Self* (Shannon: Irish University Press, 1973), 71-2. On this difficult passage cf. J. Igal, "La Genesis de la Inteligencia en un pasaje de las de Plotino (V.1.7.4-35)," *Emerita* 39 (1971), M. Atkinson, *Ennead V 1: On the Three Principal Hypostases. A Commentary with Translation* (Oxford: Oxford University Press 1983), 156-60, and J. Bussanich, op. cit., 37-43. Should V. 1.6.17-18 be read differently? Cf. A.C. Lloyd, "Plotinus on the Genesis of Thought and Existence," *Oxford Studies in Ancient Philosophy* 5 (1987): 159-60.

34. If this were not so, then a real relation between the One and νοῦς would be erected. It is pertinent to recall *Parmenides* 132de where Parmenides derives a regress from Socrates' argument that Forms are παραδείγματα wherein their instances are images or ὁμοιώματα of these. Parmenides' argument is that we can consider model and copy καθ' ὅσον the one is like the other. This presumes a real relation is possible. T. Szlezák, *Platon und Aristoteles in der Nuslehre Plotins* (Basel: Schwabe & Co., 1979), 164 n. 539 is too quick to dismiss the containment of Forms in the One as inconsistent with Plotinus' general doctrines. Cf. V. 1.7.10-13: ὃν οὖν ἐστὶ [the One] δύναντος, ταῦτα ἀπὸ τῆς δυνάμεως οἷον σχιζομένη ἢ νόησις καθοπῆ ἢ οὐκ ἂν νοῦς. Ἐπεὶ καὶ παρ' αὐτοῦ ἔχει ἡδὲ οἷον συνείσθησιν τῆς δυνάμεως, ὅτι δύνανται οὐσίαν and the analysis of this passage by Igal, op. cit., 142ff. As Igal argues, the subject of δύνανται is νοῦς. So Lloyd, op. cit., 161. Since νοῦς is eternally contemplating Forms, the sense in which the One has all

Forms indistinctly in it ought to mean that goodness for νοῦς is just contemplating Forms and that the One is the cause of the existence of this ἐνέργεια.

35. If I understand Lloyd, op. cit, 175-6, rightly, my interpretation is consonant with his own. Lloyd thinks that it is the One as object of thought which acts on νοῦς and produces οὐσία, whereas I have said that it is the One as object of desire. Perhaps draw amount to the same thing if the desire of νοῦς is just βούλησις, an intellectual desire.

36. On the generation of νοῦς and Forms from the One cf. V.2.1.7-11. Also, III.8.9.29-32; V.1.5.18-19; V.1.7.5-35; V.3.10.40-4; V.3.11.4-12; V.4.2.4-7; V.5.5.15; VI.7-17.14-16, 21; VI.7.35.19-23. All of these passages analyze the generation of νοῦς into a twofold process or presume such an analysis. The point of this logical analysis which is couched in temporal terms only for heuristic purposes, is to indicate both the priority of being and desire to knowing and the essential complexity of the ἐνέργεια of cognition. V.9.8.9-22 makes abundantly clear that the derivation of νοῦς is logical.

37. V.4.2.3.

38. Cf. IV.8.3.10; V.1.8.26; V.3.15.11, 22; VI.2.2.2; VI.2.10.11; VI.2.15.14; VI.2.21.7; 46-7; VI.2.22.10; VI.5.6.1-2; VI.6.8.22; VI.6.13.52-3; VI.7.8.17-8; VI.7.14.11-12; VI.7.39.11-14. There are some very weak arguments for the existence of νοῦς offered at V.9.4.

39. At VI.9.5.16-20 Plotinus says of νοῦς that it is a πᾶθος ἀδιάκριτον καὶ αὐτοδιακεκρωμένον and just as in ἐπιστήμησις πάντων ἐν ἀμεινῇ ὄντων ὁμοῦ ἐστὶν ἕκαστον χωρὶς αἰνῶν. The divisions and separateness of the parts of νοῦς cannot be the same as what is divided in discursive judgment. I think that what it does mean is that νοῦς is virtually divisible in discursive judgments. Cf. VI.4.2.22-3 (with lines 47-9) where Plotinus says that that which participates in true being ὅλην ὄν ἐντυγχάνει τῷ ὄντι. A.C. Lloyd, "Non-Propositional Thought in Plotinus," *Phronesis* 31 (1986): 362, replying to R. Sorabji, "Myths About Non-Propositional Thought," in M. Schofield and M. Nussbaum (eds.), *Language and Logos Studies in Ancient Greek Philosophy* (1982) and *Time, Creation & the Continuum* (Ithaca, N.Y. Cornell University Press, 1983), 152-6, states the position I am defending with admirable lucidity and precision: "The *totum simul* which is associated with pure intellect neither is nor is known by a collection of propositions, but is what occupies the place of the genus of being. For that can be grasped as a merely undifferentiated whole, while in fact it contains a multiplicity of parts. It is the former aspect, Being as an intentional or phenomenological object, which is the content of the thinking qua thinking and whose non-complexity prevents it from being propositional." Cf. J.M. Rist, "Back to the Mysticism of Plotinus: Some More Specifics," *Journal of the History of Philosophy* 27 (1989): 190-7 and M.R. Alfino, "Plotinus on the Possibility of Non-Propositional Thought," *Ancient Philosophy* 8 (1988): 273-6 also replying to Sorabji.

40. V.9.8.23.

41. V.5.1.42-4: εἰ δ' ἀπλᾶ φέουσι, δίκαιον χωρὶς καὶ καλόν, πρῶτον μὲν οὐχ ἐν τι οὐδ' ἐν ἐνὶ τῷ νοητῶν ἔσται, ἀλλὰ διεσπασμένον ἕκαστον.

42. V.9.8.18.

## Platonism in Late Classical Antiquity and Some Indian Parallels

Henry J. Blumenthal

The Platonism of late antiquity is, of course, what we now call Neoplatonism. That term is a modern one.<sup>1</sup> All the philosophers whose work comes under this heading thought of themselves simply as Platonists, and the doctrine they were expounding as the Platonic philosophy. For Plotinus, the man normally thought of as the founder of this type of philosophy, all that he might have to say had been said before though it might not have been set out explicitly, and could be found in the text of Plato (cf. V 1.8.10-14). For Proclus in the 5th century, after two hundred years of this kind of thinking, the same view of what he was doing still stood, as it did for Simplicius and Damascius into the 6th. Thus Proclus, in the preface to his *Platonic Theology*, could write of his whole enterprise, and that of his Neoplatonic predecessors, as the understanding and exposition of the truths in Plato.<sup>2</sup>

Given our modern views of Plato and Aristotle, as philosophers whose views developed and whose answers to questions were not always the same, it is important to realize that their ancient interpreters looked at them as creators of fixed systems: though they might recognize that they did not always say the same things about the same questions, they saw such apparent inconsistencies as problems about the relation of disparate statements to an assumed single doctrine rather than about how different doctrines might relate to each other.

Before going on I should perhaps offer three explanations and an apology. The apology is simple: it is to those who know a great deal about Neoplatonism, to whom some of what I shall say is basic common knowledge. The explanations are three.

First, that I am taking late classical antiquity to start in the 3rd century C.E., following an old Cambridge custom of taking ancient Greek philosophy to have ended in the year 180. The second is to say what I am going to do here. It relates to the first. When this view of the limits of classical antiquity still held, the study of Neoplatonism was regarded as rather disreputable, in the English-speaking world at least,

and the few apparent exceptions tend to prove the rule. Thus E. R. Dodds' edition of Proclus *Elements*, still one of the great achievements of Neoplatonic scholarship, and the first modern commentary on a Neoplatonic work, was seen not so much as evidence that there was here a rich field for new scholarly endeavour as an indication of that scholar's eccentricity. The common attitude found its expression in the preface to the first volume of W.K.C. Guthrie's *History of Greek Philosophy*, where he relegated Neoplatonism to the realms of the unphilosophical and the un-Greek: "with Plotinus and his followers, as well as with their Christian contemporaries, there does seem to enter a new religious spirit which is not fundamentally Greek...": that was in 1962.<sup>3</sup> "What I want to do is to look at some of the characteristics of Neoplatonism, and to see how the picture of this philosophy, or rather group of philosophies, has changed during the last three decades. I think most would now agree it is basically Greek."<sup>4</sup> As to the importance of the religious and soteriological elements in it, which for many of its adherents was rather small in any case, that is arguable, and its significance depends on the extent to which one regards other forms of ancient philosophy as enquiries into how one should live the best life. What is important is that most of the Neoplatonic writings we have are clearly philosophical rather than religious or otherwise concerned with the supernatural. I shall therefore take it for granted that we are talking about philosophy, and not any of the other things with which Neoplatonism has sometimes, not always wrongly, been associated. We might note, however, that the combination of philosophical and other concerns, which is more marked in Neoplatonism than in earlier Greek philosophy, is also to be found in some Indian systems.

The third explanation concerns the possible Indian parallels in my title. I have already indicated that I regard Neoplatonism as a purely Greek phenomenon. Though some ideas in it may resemble some Indian philosophical ideas, and those that come under the heading of Advaita in particular, there is no evidence that there was any influence in either direction. What is more interesting, and potentially enlightening, is to consider what parallels there may be between the various kinds of Neoplatonism and the systems of Indian thought which might have something in common with it. At this stage I should make it clear that I have no expertise in Indian philosophy, and in that respect I have come here in the hope of learning from those who do. I should, however, like to observe that almost all the discussion that there has been has centred

on Plotinus, and that it would be interesting to see whether the differences between his philosophy and that of later Neoplatonists might also be found in those Indian thinkers who have ideas in common with, but not ancestral to or drawn from, later Greek Neoplatonism. A look at the index of *Neoplatonism and Indian Thought* shows over five times as many references to Plotinus as to Porphyry or Proclus, the latter being almost entirely confined to two contributions.<sup>5</sup> Iamblichus, Damascius and the Aristotelian commentators are conspicuous only by their almost complete absence. The commentators are represented only by a single appearance of Simplicius, and that not in his own right but as a source for Proclus. I would also observe that a lot of the comparisons that have been made between Plotinus and Indian philosophy have taken as their basis Advaita-Vedanta as expounded by Sankara who was born about five centuries after Plotinus' death, a chronological fact that is rarely mentioned. It should be, because it, of course, rules out any possibility of influence on Plotinus: as far as I know there is no evidence of influence in the other direction either. In fact this insouciance is characteristic of much work that has been done in the whole area: I hardly need to spell out its implications. Perhaps our work here can improve this unsatisfactory situation.

Let us now return to the new version of Platonism, as it is to be seen in the thought of Plotinus. Of course some of the ingredients of that thought were developed in the interval between him and Plato, but it is to Plotinus that we owe the reworking of these and other ingredients into an original and philosophically coherent whole.

Since we are looking at the development of the picture of Neoplatonism as well as the characteristics of its thought, it is interesting to note that the concept of Plotinus has changed more than once. At one time he was thought of primarily as a mystic, and it was somehow supposed that his experience coloured, not to say, vitiated his philosophy. He then came to be seen as a serious philosopher, inferior in antiquity only to Plato and Aristotle, but unlike them, a philosopher with a system rather than the instigator of a series of enquiries many of which led to no clear solution. Now he is starting to look more like his predecessors, a thinker who was often unable to make up his mind on the right answer to some of the questions which he considered over and over again.

The other striking feature of Plotinus' thought, which is by no means peculiar to him, is that much of it is devoted to a quest for

solutions to matters that were problematic in Plato. His successors and I hasten to add that I am using the word primarily in a chronological sense were concerned in their turn not only with these matters but with some loose ends in the new version of Plato that Plotinus had produced. For these reasons I think it may be worth spending some time on Plotinus himself.

Let us begin by looking at some of the rather obvious problems in Plato. The most important in its consequences was the nature and status of the Good (ἐνέκεινα τῆς οὐσίας...ὑπερέχοντος) on the other side of being ... and lying above or beyond it (*Republic* 509B). Most English-speaking students of ancient philosophy would have little trouble with this, and interpret it as meaning that the Good was the Form on the far side of the constituents of the world of Ideas, and so furthest from us, but still a Form. Some in other places would take it to mean that it was beyond the other Forms and so not a form at all.<sup>6</sup> Plotinus and his successors had no doubt that the later interpretation was a correct one and so turned the Form of the Good into something that was not a Form at all, but an entity, or rather a non-entity, that transcended all the other Forms and was the source of their existence: the second part of this proposition does, of course, have clear support in the *Republic*, most obviously in 509B itself, just before the controversial words. The Good beyond Being was also identified with the first hypothesis of the *Parmenides*, for it was assumed by all Neoplatonists that dialogue contained positive teaching rather than logical exercises or any of the other subjects with which it has at various times been supposed to deal. So clear was this to the Neoplatonists that they eventually came to classify this dialogue, along with the *Timaeus*, as one of the two containing the highest metaphysical truths. It was not, however, a wholly new idea that the *Parmenides* could be interpreted along such lines: attempts to extract positive teaching from the earlier hypotheses had been made in the period before Plotinus, notably by the Neopythagorean Moderatus. But now this approach became standard: the points for discussion were the number of hypotheses that could be interpreted in this way, and what the significance of each, particularly those from the fourth onwards, might be: on the first three there was for a time general agreement that they represented the three primary divisions of the Neoplatonic intelligible world, the One, (οὐς), Intellect, and (ψυχή), Soul.

As for the One, it is strictly indescribable, and its nature can only be indicated by negating descriptions which apply to Intellect, the sphere of Being in Plato's sense, populated therefore by Forms. Some of the indications of its nature which Plotinus used are taken straight from the *Parmenides*: so, for example, when Plotinus says in various places that the one has no name, and is the object of neither reason, knowledge, sense-perception or opinion, his words echo *Parmenides* 142A: it has no name, no reason, no knowledge, no sense-perception, no opinion the Greek words are the same (cf. e.g. VI 7.41.37f.).

By such and similar means Plotinus was able to offer what he regarded as a satisfactory answer to the request made on several occasions in the *Republic* that Socrates should provide a description of the Good, a request with which he notoriously never complies. Modern readers might well ask what the hypotheses of the *Parmenides* have to do with the *Republic*, and answer "nothing", but that would not have impressed Plotinus, knowing as he did that Plato had a systematic world picture to which different dialogues all contributed in their different ways. To say that one was simply unrelated to another because it was dealing with a different subject was unacceptable at this time, though as we shall see it was later to become a principle of interpretation that each dialogue had its own specific purpose. Even then it should not be incompatible with others. All this was greatly helped by the tendency which ran right through Neoplatonism to follow the letter of Plato and Aristotle while making no serious attempt to be guided by the philosophical context of a given text.

A further striking difference between Platonic and Neoplatonic Platonism is the absence of the political, and so of many of the ethical elements, a difference which once caused Plotinus to be labelled a Plato reduced by half.<sup>7</sup> Political structures were of no interest to most of the Platonists who lived under the Roman Empire, or the earlier centuries of its Byzantine continuation. Themistius, who was a prominent member of the Byzantine governing aristocracy, and was one of the few thinkers to stand apart from Neoplatonism, is for that very reason no real exception.

So far we have been talking about the treatment of problems in Plato and we shall, of course, need to say much more about that. But before we continue we must bring in another ingredient in the compound that constitutes Neoplatonism, namely Aristotle. Its importance was already noted by Porphyry who, in a well known remark in the *Life of Plotinus* (14.4-5) wrote that there are unnoticed Stoic and Peripatetic

doctrines present in his works. He goes on to say that the *Metaphysics* are there in condensed form (*Ibid.* 5-7). The Aristotelian views with which we are particularly concerned just now are those about the nature of the unmoved mover, and the soul and its operations, for these are an essential part of the organization of the Neoplatonists' intelligible world.

The self-thinking supreme principle of Aristotle's world from the *Metaphysics*, and the notion that the thinking mind is identical with its objects from the *De anima*, with some refinements made by Alexander, formed the basis of the structure of Plotinus' second hypostasis, or level of being, Intellect. This they did by providing a means by which the components of that structure, namely the individual intellects which were also Platonic Forms, related to each other and formed "parts" of a self-thinking whole.

We can now go back to Plato, to recall some further problems which he left unclear or unsolved. In assessing their relevance we must bear in mind that a Platonic problem was as good a starting point for a Neoplatonic doctrine as was a firm statement of Plato's views. So too was a Platonic answer to a question put for the sake of argument or exploration like those in the second half of the *Parmenides*. And in the case of Intellect Plotinus' intellect all three types of Platonic texts contribute.

To start with the Platonic problem, or rather problems. First, there is the well-known passage in the *Sophist* where Plato is discussing the content of the sphere of being in the fullest sense, (τὸ παντελὲς ὄν) (248E-249A). That should contain (κίνησις, ζώή, ψυχή) and (φρόνησις:) motion, life, soul and intellect, and yet the Forms which must be a part of that sphere. I shall assume that Plato had not abandoned the view that they must be permanent and unchanging. Because of the scope that this passage gave for the introduction of life and thought into the intelligible world, it was to be a favorite text of Plotinus and his successors. Further problems offering scope for interesting if Platonically improbable solutions were available in the first part of the *Parmenides*. The difficulties raised there by Plato himself were serious enough to have led to the rethinking if not to the abandonment of the theory of Ideas. But for Plotinus they offered material for his own philosophy.

We may begin with Plato's first problem, the extent of the world of Forms. Socrates in the *Parmenides* is unwilling to accept the existence of Forms of things which are trivial or undignified; mud dirt or hair are the examples given though *Parmenides* tells him he will learn to accept

them when he becomes more of a philosopher. Whether Plato did or did not accept these particular substances as suitable for Forms, there are other doubts about what had Ideal archetypes. Most Platonists accepted Xenocrates' limitation to things that exist in nature (fr.30H). Plotinus simply said that everything that exists here in the physical world exists in the Intelligible too, though in a superior mode, and derives its existence from it: (ἐκεῖθεν ἦν σύμμιαντα ταῦτα καὶ καλλιόνως ἐκεῖ) (V 8.7.17). The word (καλλιόνως) simply avoids any problems that might be caused by having undignified and worthless objects prefigured in the intelligible world.

Only in one early treatise, which may contain some other ideas that Plotinus dropped later, or even put up only for discussion, and in a rather disjointed chapter of it at that, are various trivial and offensive things excluded. This is the only place where mud and dirt are mentioned, with the suggestion that things of that kind are imperfections, and so not to be sought in Intellect, but rather to belong to Soul and to arise from its inability to produce anything better from matter (V 9.14.7-17) admittedly a paradox in terms of Plotinus' account of the world. Elsewhere one can find warrant for the inclusion of earth and earthy things, and so of mud (cf. VI 7.11).

Whatever they might be like in this world, the inferior things are present in the higher world in a form appropriate to it. Whether or not each individual object or person was also represented there, is a different matter, but I should say it was one of those questions on which Plotinus never finally made up his mind. In any case the apparently simple answer that whatever is here must be there too is not simply a move to avoid facing a Platonic problem. It is a necessary part of a fully monistic system in which everything derives from the One and nothing has an independent existence like the receptacle in Plato's *Timaeus*: one might describe it as non-dualism. When Intellect emerges from the one the kind of Being that is the result of its procession is Form, and not just the form of something, but of everything, with nothing excluded (V 5.6.1-4).

The next problem raised in the *Parmenides* is participation, but before looking at that it may be helpful to explain why a world whose constituents are Forms is described as Intellect, a description which is unremarkable in a Neoplatonic context, but would clearly have puzzled a classical Platonist. In terms of Platonic loose ends we may begin yet again with a *Parmenides* problem, namely the one about the difficulties

in thinking of the Forms as thoughts (*νοήματα*) which would be located in souls. It is presented as a possible solution to previous difficulties, but naturally turned down because it would deny to the Forms the self-subsistent status which was essential to them. But if a Form is a *νόημα*, it cannot be a thought of nothing, so goes the argument, and if it is to be a thought of something, it must be a thought of something that is: it would then be a thought of the one single Idea discernible in its several objects, and that would be the Form. Since for Plato thoughts and their objects are not identical, the original thought could not be a Form after all. A further objection is that if particulars participate in Forms in the way participation is envisaged by Socrates, a reference to *Phaedo*-type participation then they too would be thoughts. If they did not there would be thoughts that do not think (*νοήματα ἀνόητα*). That, Socrates is made to say, would make no sense, and so the proposal is abandoned (132B-C).

If we now return to Plotinus, we find that not only the proposal itself, but some of the consequences which Plato regarded as unacceptable, are taken on board as appropriate to Forms as he conceived them. It is here that the Aristotelian input is most marked. The extent to which the *Parmenides* problem influenced Plotinus appears most clearly in the Treatise "That the intelligibles are not outside the Intellect, and on the Good" (V 5) which discusses both the nature of the contents of Intellect and their internal relationships. Whether or not the intelligibles were contained in Intellect, or were outside, had been a matter of controversy, and both positive and negative answers seem to have been given as interpretations of Plato: we have Porphyry's account of how he was converted to Plotinus' view by a fellow student, Amelius (Life 18.10-22). We are not now dealing simply with the Middle Platonist notion that the Ideas were the thoughts of God, *inter alia* because for Plotinus Intellect was not the supreme principle.<sup>8</sup>

The starting points for this discussion are usually taken as the Demiurge's model in the *Timaeus* and Aristotle's self-thinking Intellect. While the latter is, as we have already indicated, important both here and elsewhere, the section of the *Parmenides* we have just considered has clearly been one of Plotinus' points of departure. That emerges at the very start of the treatise, where Plotinus asks whether Intellect could think things which do not exist and whether it could be not-intelligizing, an expression which recalls the thought which do not think in *Parmenides* 321C. Plotinus takes the answer to both questions to be

negative and says that therefore Intellect must know itself (V 5.1.3-6). It cognizes intelligibles, which must be like itself because if they were not it would be impossible to do so: to cognize what is other and external is characteristic of sense-perception rather than intellection. The kinds of beings that are to be found at this level must be intelligible (*νοητά*) else they could not be parts of Intellect (*Νοῦς*) if they are not intelligible and without life, how can they be beings, asks Plotinus (*Ibid.* 37). In a later chapter Plotinus spells out that intelligence and being are the same: so we have one kind of thing, nature, all being, and truth (V 6.3.1f.). In an earlier treatise he had already argued that intellect and being entailed each other: if there is being, then there is intellect: if intellect, then being (V 6.6.21). Forms are identified with Intellect in other places, most notably in the long discussion of the contents of Intellect in the treatise on "How the multitude of Forms came into being, and the Good" (VI 7, cf. esp. ch. 2 *passim*).

Thus for Plotinus Ideas are indeed thoughts, and since all Ideas are both thought and objects of thought all are *νοήματα*, and none of them (*ἀνόητα*). In other words Plotinus has accepted an identification which was unacceptable in the *Parmenides* and turned it into a description of essential features of his second hypostasis. In all the places we have just referred to the identity of the contents of Intellect both with the whole and with each other rests on the Aristotelian identity of thought and thinker, as set out in the (*De anima*). It is this which makes sense of the notion that any part of Being, as soon as it is conceived as an object of thought, becomes itself an intellect. One could discuss at some length whether Being or Intellect is prior: the short answer would be that it depends on the context, but the question is only a real one if one considers the procession of the hypostases quasi-chronologically otherwise it does not matter. That intellect, as a whole, is based on the self-thinking (*νοῦς*) of *Metaphysics Lambda*, should by now be clear enough. It differs in two ways: in not being the supreme principle, and in having acquired some content for its thinking.

Participation problems raised in the *Parmenides* are also soluble if one operates with Plotinus' suppositions. Two difficulties about participation are raised. The first is that if each particular participates in the whole of a Form, then that Form will be split up: none of the attempted explanations is accepted. Alternatively, each particular might be thought of as participating in part of a Form rather than the whole of it. In that case paradoxical consequences appear to result: a small

particular, for example, would be in possession of a part of smallness smaller than the Idea of smallness itself. Part of Plato's trouble was that he was still inclined to think of immaterial entities as though they had material attributes. Plotinus, who no longer did, was able to think of immaterial entities being omnipresent in the material world. The treatise, split by Porphyry into VI 4 and 5, which he wrote to explore the implications of such omnipresence is now known by a title which may well be taken from the problems, of this part of the *Parmenides*. Admittedly the title is Porphyry's, though Porphyry's claim that the titles of his edition were those by which the treatises were generally known does not exclude that it was originally Plotinus' own. The title is *περὶ τοῦ τό ὄν ἐν καὶ ταῦτόν ὄν ἅμα πανταχοῦ εἶναι ὅλον*, on Being being one and the same at the same time everywhere. The sentence in which Plato expresses the difficulty he sees in participation in whole Forms runs: *ἔν ἅρα ὄν καὶ ταῦτόν ἐν πολλοῖς καὶ χωρὶς οὖσιν ὅλον ἅμα ἐνέσται*, so Being is one and is at the same time present in many things which are separate (131B): the resemblance is too close to be entirely coincidental. The complete and simultaneous presence of the intelligible applies not only to the contents of Being in the strictest sense, namely the collection of individual beings which constitutes the second hypostasis, but also the larger collection of the same entities existing in a more diffuse form in the third. In fact in this treatise Plotinus is not particularly concerned with differences between these two hypostases, but more interested in the nature of the intelligible as a whole, and as opposed to the sensible. A tendency to blur the distinction between these two hypostases was to be one of the loose ends in Plotinus that was picked up by later Neoplatonists. What is of interest in our present context is that the presence of beings (*ὄντα*) in a more diffuse form in Soul makes it easier to think of them as omnipresent at the even further diffused level of existence which is the physical world. When a Form is in the individuals it somehow becomes multiple, like the impressions made by a single seal. It might also be regarded as analogous to the presence of a single soul in each part of its body as opposed to a quality like white which is divisible (cf. VI 5.6.1-15).

Strictly speaking Plotinus would say that the body, or whatever, was in its soul: here he follows the lead of the *Timaeus* (34B and 36D) where the world is said to be in its soul, an idea which Plotinus developed into the general principle that a lower kind of being is always in a higher one rather than vice-versa. While closer examination might

reveal difficulties in the notion that any one particular is in the Form that makes it what it is, it does make it possible for Plotinus to escape from the problems presented by the splitting of Forms in the *Parmenides*.<sup>7</sup> A further section of the *Timaeus* was also helpful here, namely the well-known passage on the ingredients of soul at 35A. The correct interpretation of this passage is, of course, unclear, but what Plotinus found in it included a distinction between what is divisible only in so far as it is distributed around bodies, which is soul, and what is actually divided in bodies, that is sensible qualities. This interpretation of *Timaeus* 35A is applied to omnipresence as a whole at IV 2.2.39-42, though there it is clearly at the level of souls. It does, however, help to show how Plotinus sees the presence of the intelligible in the sensible world.

In any case the ability to explain how an intelligible entity can be present as a whole in more than one place means that the arguably unreal difficulty about pieces of Forms being better representations of some things than the Forms themselves disappears. Let us return for a moment to VI 4-5, where chapter 8 of VI 5 provides some further comment on the whole or part problem. The Idea, writes Plotinus, gives none of itself to matter because it cannot be broken up. Being itself one it has the capacity to inform what is not one with its own unity, and to be present with all of itself in such a way as to inform each individual part of anything with the whole of itself (cf. VI 5.8.35-39). In any case, as he had argued earlier in the treatise, an entity which is immaterial must be exempt from all the *pathe*, affections, of the body of which the most important is divisibility: what has no magnitude cannot be divided (VI 4.8.15-22). A further argument depends on the nonspatial nature of the intelligible: what is not in space cannot be divided if division means, as it does, that one part of a thing is in one place and another in another (*Ibid.* 33-36).

At this point one might ask how a Form can be present as a whole everywhere without replicating itself, and giving rise to one of the variants of the "third man" problem, the alleged need for an extra Form to account for the relation between the original Form and its descendants. Plotinus' answer would be in terms of the way in which lower entities could partake in, or receive higher ones. The participating one participates to the extent that it can, and takes on as much of that in which it participates as it is able, although the whole is present (VI 4.3.10-11). As much as, is not it should hardly need saying a reference

to the size of a piece of Form or soul, but of the extent to which it is available to the participating subject.

So far we have been looking primarily at Plotinus' responses to some of the problems raised in the first part of the *Parmenides*, and these are the most interesting in so far as they show how what had been problems were either explained away or even adopted as positive contributions to parts of Plotinus' own philosophy. But before we go on we should look again at the way in which material from the hypotheses was used to delineate the features of the several hypostases. We have already seen how this worked in the case of the negations used to speak about the ineffable One. In the same way the second hypothesis will give Plotinus some of the distinctive characteristics of Intellect, and its appendix, sometimes taken as the third, of Soul. Soul, however, relates to the dialogue much less clearly than Intellect and the one.

The unity of Soul is such that diversity will appear in it, while that of Intellect is greater, to the extent of the unity there predominating over the diversity and multiplicity of the individual intellects or Forms which are to be found there. Plotinus most often distinguishes Intellect as *εἷς καὶ πολλοί*, one and many (both masculine), from Soul which is (*πολλὰ καὶ μία*), many (neuter) and one (feminine), but at V. 1. 8.23-27 he refers to the Platonic *Parmenides* distinguishing the first one, which is more properly one, the second which he calls *ἐν πολλὰ*, one many, and the third which is *ἐν καὶ πολλὰ*, one and many (neuter in both cases). The *Parmenides* says of the one that is that it is *ἐν πολλὰ* one many, at 144E, in the second hypothesis, while at 155E the "third" talks of a one that is and is many, *ἐν καὶ πολλὰ*. The rest and movement in Intellect, perhaps primarily drawn from the *Sophist*, may also be found in the second hypothesis: this one must be in motion and at rest (145E).

Plotinus did not, of course, write commentaries as such, but an extended discussion of how his intelligible hierarchy related to various texts from Heraclitus to Plato, many of them perversely interpreted, may be found in the treatise "On the three primary hypostases", V. 1. That he did not write commentaries was no bar to his works being treated as commentary by his successors, who expressed themselves in that medium more and more as time went on. Not only were they convinced that they were merely expounding the philosophy of Plato: while doing so they were often explaining and, where necessary, reconciling with Plato's doctrines the writings of the Platonist philosopher Aristotle.

It is time to move on from Plotinus to the rest of the story: I have spent so long on Plotinus because he produced outlines and guidelines for later Greek philosophy. That is by no means to say that he was followed in every detail. Of course he was not: guidelines were sometimes abandoned, and outlines obscured. The first point to stress again, one well-enough known to those who occupy themselves with the thought of later antiquity, is that the new Platonism was not an undifferentiated mass. It is not so long since that was how it was regarded, and even a pioneering historian like E. Vacherot, who was well enough aware of some of the differences, could lump all the Neoplatonists together under the heading of *Ecole d'Alexandrie*,<sup>10</sup> though, to be fair, he did make some attempt to sort them into less comprehensive categories, as did E. Zeller, in different versions of his *Geschichte der Philosophie der Griechen*, influenced perhaps by Hegelian preconceptions rather than the facts of philosophical history.<sup>11</sup>

Even among those not unfamiliar with the field there was a tendency to think of two kinds of Neoplatonism, a Plotinian-Porphyrrian variety and a late and nasty kind beginning with Iamblichus and losing itself in the highly complex structures of Damascius. A further, but as it now turns out, partly misguided attempt to sort later Neoplatonists into groups defined by their approach to philosophical problems as well as the geographical locations in which they studied and taught was made by Karl Praechter in a well-known article published in 1910, entitled 'Richtungen und Schuler im Neuplatonismus'.<sup>12</sup> Among others Praechter distinguished a more scholarly from a speculative strain of Neoplatonism, and associated the former with Alexandria, the latter with Athens. The thinkers who most clearly represented these tendencies were Proclus and Damascius at Athens, and the Aristotelian commentators at Alexandria. The first was responsible for an ever increasing complexity and multiplication of entities as well as, one might add, an interest in dubiously philosophical matters, the second for a more sober approach which restrained these inclinations. This picture was generally accepted, even after H. D. Saffrey, in an article published in 1954, had demonstrated the extent of the connections between the two centres: not only was there considerable movement between them by persons who studied at one and subsequently taught at the other: there were even family connections between them.<sup>13</sup> One obvious problem for anyone working within this theoretical framework is as Praechter realized what to do about Simplicius, superficially an Alexandrian by virtue of his

output, but an Athenian by location and association. Praechter himself, in an article on Simplicius written nearly twenty years later, in Pauly-Wissowa's classical encyclopedia, sought to distinguish an Alexandrian strain manifested in Simplicius' commentary on Epictetus' *Encheiridion* from an Athenian one in the other works. This is a matter to which we must return: let us now go back to the beginning of post-Plotinian Neoplatonism.

The old view of its development, and this includes Praechter's, saw Porphyry not only as the editor of Plotinus' works, but as a faithful disciple of his master, following him rather closely but admitting, or allowing greater scope to, tendencies which Plotinus had avoided, like the major excursion into allegorical interpretation in the exposition of the Odyssean Cave of the Nymphs in the work of that name.

More recent work on Porphyry has seen him prepared to depart from Plotinus in a reorganization of the intelligible world which led to the reduction of Plotinus' three hypostases to two, by treating Soul and Intellect as one: even the One and Intellect were not, on this view, as clearly distinguished as they needed to be if they were to be kept clearly apart, as they are not in the Turin fragment of a *Parmenides* commentary attributed to him by Professor P. Hadot.<sup>14</sup> This so-called telescoping of the hypostases, expounded by Professor A. C. Lloyd in the *Cambridge History of later Greek and Early Medieval Philosophy*,<sup>15</sup> was widely accepted, but has been questioned in some subsequent work, which would see Porphyry preserving the Plotinian structure. Another area where Porphyry did move on from Plotinus was in the explanation of the body-soul relation: this was one of the Platonic loose ends which Plotinus had difficulty in tying up, for reasons which are perhaps too obvious to state, namely the difficulty of establishing a satisfactory relation between the incorporeal and the material, an old problem which merely became less obtrusive in Neoplatonism because of its monism. Porphyry's solution was produced by the use of his doctrine of *ἀσύγχωρος ἔνωσις*, unconfused unification of things that were in fact uncombinable.

That was a doctrine that did not find favour with later Neoplatonists, who preferred the more Platonic notion of some sort of juxtaposition, obscured by some of them by the interposition of extra levels of soul, of which the last was almost an Aristotelian entelechy.<sup>16</sup> They did, however, adopt and sometimes extend a doctrine that was first taken seriously by Porphyry, that between soul and body there was a

quasi-material vehicle made of some sort of *πνεῦμα*. What is interesting from the point of view of the development of Neoplatonism is that both these questions, the body-soul relationship and the distinction, or lack of it, between the hypostases Intellect and Soul, were ones on which the answers given by Plotinus were either unclear or conspicuously inadequate—adequate of course to late Platonists, not to us, who would generally find their solutions even worse. They were therefore questions which presented a challenge to later Neoplatonists in just the same way as problems in Plato had presented a challenge to Plotinus himself.

In two ways Porphyry may be seen as departing from Plotinus, if not necessarily from the Platonic tradition, in directions where later Neoplatonists were to follow. One was in the adoption of Aristotle's categories into the Platonist system. Plotinus himself had rejected them as inappropriate. The other, not unconnected, was the practice of writing commentaries on Aristotle, two of them in addition to the Introduction on the *Categories* itself. In his treatment of Aristotle he also seems to have moved further in the direction of later Neoplatonism, by taking the line that Aristotle and Plato were really expounding the same philosophy in different words: the lost commentary, or part commentary, on *Metaphysics* A would have made it easier to assess both the scope and the practical effects of that hypothesis.

Before continuing it might be useful to say some more about why the relation between Intellect and Soul in Plotinus may be called a "loose-end". The answer is that though Plotinus insisted that there were three hypostases, neither more nor fewer, his treatments of the second and third vary according to context in such a way that one may be equipped with the attributes of the other.<sup>17</sup> Thus when Plotinus is concerned with the structure of his world, they are kept clearly apart. On the other hand, where he is trying to show how all things are present in the Intellect, he will put into it the dynamic aspects of the intelligible which more properly belong in Soul. Conversely, when he is dealing with the transcendence of Soul above the material world he will emphasize the static elements of intelligible being which more properly belong to Intellect. Lest this seem merely careless or irresponsible, we should note that it arises in part from the difficulty of distinguishing different kinds of immaterial existence, a difficulty which sometimes led Plotinus to say that they differed by otherness alone. Such untidiness was not acceptable to later Neoplatonists, who felt no inhibitions about

multiplying the number of immaterial entities, and levels of immaterial existence, which they admitted to their philosophy.

The most important steps in this direction were taken by Iamblichus. Here again our picture of the development of Neoplatonism has changed. Partly because of the accidents of survival, the credit or discredit for these changes once tended to be attributed to Proclus. Iamblichus, whose strictly philosophical work was represented by fragments in Stobaeus and the reports of his successors while productions like the *De mysteriis* and works on Pythagoras survived, was held responsible for the corruption of Neoplatonism by superstition and occultism. During the last twenty years there has been a process of rehabilitation<sup>18</sup> in my view it has gone a little too far and concentration on what we can learn about Iamblichus' interpretation of Plato and Aristotle, and the philosophical views expressed therein, has shown that he was responsible for at least two of the characteristic features of later Neoplatonism, namely the elaboration of the structures of the intelligible world, and the exposition of Neoplatonism in a course where Aristotle was studied as a preliminary to the study of Plato's dialogues, arranged in a fixed curriculum leading to the highest insights of the *Parmenides* and *Timaeus*, with each dialogue being assigned a peculiar purpose, as were some of the works of Aristotle. Just how far all the details were worked out by Iamblichus himself is uncertain, but that he provided the initial framework is clear enough. So is the fact that Proclus, however much he may have esteemed him, did not always agree with Iamblichus. Less clear is the extent of the contributions of Proclus' master Syrianus: these are now receiving more attention and looking correspondingly more important.<sup>19</sup>

Even those who have some expertise in Neoplatonism have all too readily thought of Iamblichus as the immediate precursor of Proclus. In fact Iamblichus may have been a student of Porphyry's at the end of the 3rd century; Proclus was not born till the 5th. What happened between them is by no means clear, and such attempts as have been made to trace the philosophical history for pagans of the intervening period have been hindered by the lack of surviving works and the paucity of other evidence, particularly for the 4th century.

It may in any case be true that not a great deal happened before the study of Platonism was revived at Athens, probably by the Athenian Plutarch the son of Nestorius late in the 4th century or early in the 5th: the case for attributing the revival to him is strong, if not impregnable.<sup>20</sup>

At Alexandria, though there was a continuous tradition of, at least, Platonist mathematics, from which emerged Hypatia at the end of the fourth century with her pupils Synesius and probably Hierocles, most of the interesting developments took place later. Many of those involved, and the case of Hierocles is particularly worth noting, had been students of Plutarch and his Athenian disciples, Syrianus and Proclus, most importantly Ammonius not, of course, the mysterious Ammonius Saccas, whom I have deliberately left out of this account.

Let us return for the moment to the restructured type of intelligible hierarchy associated with Iamblichus and Proclus, but present in one form or another in most of those who came after Plutarch. We have already referred to its greater degree of elaboration. In it souls and intellects were clearly distinguished, and furthermore divided into different kinds of each, in a framework of triadic structures in which entities were grouped by virtue of participation or lack of it: various orders of gods, all of which could be linked to the *Parmenides*,<sup>21</sup> were also worked into this system. The highest member of a vertical triad would be distinguished by being unparticipated: the second by participating in the first and being participated in by the third, the third by being merely a participant. The separation of an unparticipated level meant that the aspect of soul or intellect that was to be found there was separate from what came below, notwithstanding the apparently conflicting principle that higher entities acted at a greater distance than lower ones. Thus everything could be kept in its own place, and the demarcation problems that arose in the case of Plotinus' second and third hypostases no longer applied. At the same time horizontal triads formalized the relation between different aspects of a given level of being, a system already prefigured in the more informal discussions in Plotinus, of Being, Life and Thought in the hypostasis Intellect. Here again Porphyry began the more formal and rigid treatment of questions which had been explored without firm conclusions by Plotinus, and one might see this too as a part of the process of tying up loose ends even if the outcome was a degree of complication that we might think required radical simplification.

That the structures of Proclus were a conscious move towards greater order appears in his comment that Syrianus had cleared up some of the vagueness and confusion of his predecessors: "he set determinate limits to what was undetermined in the speculation of our predecessors, and put the confused state of the various orders into a condition where

they could be distinguished intellectually" (*Platonic Theology*, 1.10-42.4-20S-W). Similar comments may be found elsewhere. That one might accuse Proclus of causing confusion by having too many entities is another matter. In one respect he had fewer than Iamblichus, for Iamblichus took the creation of new entities to the highest level, and invented a one above the one, a lead rejected by Proclus but followed later by Damascius.

Another piece of tidying up that should be mentioned here, though it is well-enough known, is the rejection of Plotinus' view that a part of the individual human soul could remain transcendent, either at the level of Soul or Intellect, another point on which Plotinus may not have come to a final decision. This view, which Plotinus admitted to be unorthodox (cf. IV 8.1.13), allowed each person a permanent place in the intelligible. Apart from the fact that this broke through the boundaries of the Neoplatonic world, it had other consequences which were regarded as unacceptable by Iamblichus, Plutarch, Syrianus, Proclus, and Simplicius: among their complaints were that it entailed permanent intellection on the one hand, and impeccability on the other.<sup>22</sup> For Iamblichus there is just one text that points in the opposite direction, though it may be a mistake by Simplicius.<sup>23</sup> Otherwise there was a wide consensus, which had implications not only for the means by which some Neoplatonists thought one might ascend to the highest levels but also for the interpretation of Aristotle.

The interpretation of Aristotle brings us back to the question of the two schools of Athens and Alexandria: were they the repository of different kinds of Neoplatonism, and if so how did the Alexandrian kind diverge from the sort of philosophy which we have sketched in relation to Proclus?

Until about fifteen years ago it was generally accepted, following Praechter, that the two groups were philosophically different, and that the Alexandrians were distinguished by having a simpler metaphysical system in general, and not believing in a transcendent one in particular. In some cases these characteristics could be attributed to the fact that their works were commentaries, so that they might have been keeping their own views in the background. I think their methods of work are now sufficiently well-known for it to be apparent that that is not likely to be the correct explanation. Here too views have changed, and the picture of an Alexandrian commentator, of whom Simplicius was taken to be a particularly good example, carefully if somewhat verbosely expounding

the text of Aristotle in a basically scholarly way is no longer on display: not long ago many would have thought that a perfectly reasonable assumption, and one equally valid for most of the commentators. Now that it is coming to be recognized as false even by those without a special interest in late Neoplatonism, there is a corresponding realization that the personal philosophies which find expression in the commentaries may differ. We shall look briefly at a few examples of such differences, which must serve to cast doubt on the notion of a specifically Alexandrian line. That there was such a line, to be opposed to an Athenian one, is *prima facie* questionable if one considers the extent of the cross-fertilization between Athens and Alexandria. In any case closer examination of two works which Praechter had put forward as examples of Alexandrian metaphysics, the *Encheiridion* commentary by Simplicius to which we have already referred, and Hierocles' on the Pythagorean *Carmen Aureum*, has shown that they are not. Not only is it true that the more complex metaphysics present elsewhere are not always relevant. The existence of a One can be shown to be either implicit or clearly required in some passages of each. That was demonstrated ten years ago by Mme. I. Hadot,<sup>24</sup> and in itself invalidates an important part of the till then traditional distinction. It does not, I hasten to add, prove that there were no differences between the two centres, or that Athenian metaphysics was not sometimes more elaborate than Alexandrian: this is still an open question.

With these points in mind let us come back to the man who is generally credited with the responsibility for the Aristotle industry at Alexandria, Ammonius. Ammonius had learnt from the Athenians by two routes: his father Hermias had studied with Syrianus, and he himself with Proclus. He was moreover related to them through his father's marriage to Aidesia, a kinswoman of Syrianus. Further connections of this type may be seen in the careers of Hierocles who, as we have already noticed, was taught by Plutarch, and, in the reverse direction, those of Simplicius and Damascius who were taught by Ammonius at Alexandria.

Ammonius presents two problems, firstly why he inaugurated the concentration on Aristotle which was to be continued by his pupils, and secondly how much of the vast bulk of commentary he and they produced between them is attributable to him. Since some of the commentaries were published by Philoponus, purportedly based on Ammonius' lectures but in most cases "with some additions of his own", while only two have come down to us under Ammonius' own name, it is

not easy to disentangle his views: this also applies to the *Metaphysics* commentary of Asclepius, and even to those commentaries of Philoponus which have come down under his own name exclusively.<sup>25</sup> A start on this difficult task has been made, but much remains to be done.<sup>26</sup> It is complicated by the fact that Philoponus will treat Ammonius as a different person from the commentator even in work which is labelled as his. That could, of course, be the fault of the transmission rather than Philoponus, though one wonders if he was not in some cases trying to present a front of Neoplatonic respectability by presenting his own work as that of his master. His disputes with both the dead Proclus and the living Simplicius provide a reason why he might have wished to do so. Though recent work on Philoponus has tended to highlight his individuality, and the influence of Christianity on some of his ideas, it is important to remember that the framework of his thought was a Neoplatonism to most of which both Proclus and Simplicius would have subscribed, even if in his commentaries he did not go as far as Simplicius in seeking to demonstrate the agreement of Plato and Aristotle.

The other question about Ammonius is less complicated, but likewise admits of no clear answer. It had long been believed, since an article by P. Tannery at the end of the last century,<sup>27</sup> that Ammonius and his school devoted themselves to the study of Aristotle as the result of a deal with the ecclesiastical authorities by which they undertook not to teach Plato. The only evidence we have for any sort of deal is a well-known, if not well understood, remark by Damascius that Ammonius "being disgracefully avaricious and always acting with a view to making money, made an agreement with the person in charge of the dominant view", that is Christianity. In so far as it comes in one of the snippets from the *Life of Isidore* in Photius (cod. 242.292),<sup>28</sup> there is no context. In any case the view that it meant no Plato teaching is merely an inference from the amount of work on Aristotle done at Alexandria. We know that Ammonius himself lectured on the *Gorgias* at a date almost certainly later than the supposed deal: the time of that is uncertain, and the one most often used the patriarchate of Athanasius (490-97) depends on a piece of textual juxtaposition which may or may not be correct. The deal might equally well have had something to do with the conditions under which Christian pupils could attend, or be sent to attend, Ammonius' lectures: no attacks on their religion is a possible ingredient. Or even just a special elementary course? Whatever the answer the traditional explanation must be regarded as unproven.<sup>29</sup> There

are, in any case, other possible explanations for the concentration on Aristotle, apart from the obvious one that Ammonius might have been particularly interested in the subject. One is that the Alexandrians felt that there was little to add to the Plato commentaries already available, most notably those of Proclus: that did not, however, deter Damascius at Athens, or Olympiodorus in the next generation at Alexandria.

Since we are concerned with differences between individuals, we should not omit the quarrel between Simplicius and Philoponus, both pupils of Ammonius but violently at odds over the eternity of the world and the related question of the existence of a fifth element, which came to be known by the Latin calque translation 'quintessence'.<sup>30</sup> I do not intend to discuss again the importance or otherwise of Christianity in determining Philoponus' opinions. Suffice it to say that his by now unorthodox view that the world had a beginning in time is a perfectly possible interpretation of the *Timaeus*, and one that can be taken seriously now: another unsolved problem in Plato.

Philoponus' attack on Proclus in the *De Aeternitate Mundi* is part of the same dispute. Since it is securely dateable to 529 it has sometimes been seen as either a precipitating cause of the imperial edict of that year forbidding the teaching of philosophy by pagans, or a protective gesture to defend the Alexandrians against it. In view of that possibility the work has often been connected with the question of Ammonius' deal without good cause.

What about the edict itself? Everybody once knew that it put an end to Greek Philosophy, at least at Athens. That view survived as a historical fact till the late 1960s, when Alan Cameron produced arguments to show not only that pagan Platonism continued afterwards, but that it continued at Athens.<sup>31</sup> This latter part of his thesis is highly questionable, and it is better to admit that we do not know where the philosophers who left Athens shortly after the edict resumed their activities. The latest candidate, much favoured in France since 1984, is the border city of Harrân, but the case rests primarily on the testimony of an otherwise admittedly unreliable Arabic source, al-Mas'ûdî and some rather over-confident inferences from references to calendars in Simplicius.<sup>32</sup>

Alexandria continued to be the home of Aristotelian commentators, some of whom wrote on Plato too, and may even have received some of the Athenians. On this note of uncertainty, we must end the story. I do not, of course, claim to have presented an exciting new

discovery or new light on a specific problem. What I hope I have done is to show in outline what late antique Platonism looks like now, and some of the ways in which its appearance has changed. I think one can assert with some confidence that if anyone tries to do the same thing in ten year's time, the picture will have changed again. That is a measure both of the number of unanswered questions and of the rate at which they are now being approached. Comparisons with Indian thought seem to be in a similar condition.<sup>35</sup>

## Endnotes

1. 'Neoplatonist' and 'Neoplatonic' first appeared in English and French in the 1830s. The *Shorter Oxford English Dictionary* gives 1837 for the first occurrence of 'Neoplatonist' but 1845 for 'Neoplatonism'.
2. Cf. too In *Alc.* 227.18-21, where Proclus writes that we must not attribute certain things to the soul in order that we should be interpreters of Plato and not explain him in accordance with our own views.
3. (Cambridge 1962) 24.
4. This proved not to be the case at the conference itself since most of the Indian participants, as well as the usual minority of 'western' scholars, thought that there were crucial non-Greek elements in the thought or not-thought of Plotinus. But, in the absence of clear textual evidence for more than the occasional possible parallel, let alone demonstrable influence in one direction or the other, I remain unconvinced.

Hadot, ed., *Simplicius. Sa vie, son oeuvre, sa survie* (Berlin/New York 1987) 40-57, where he argues from Simplicius' references (*In Phys.* 874.32ff.) to four different beginnings of the year, that of the Athenians, 'which we use', at the summer equinox, the Asians' at the autumn one, the Romans' the winter and the Arabs' the spring: these were all used at Harrān, therefore Simplicius must be there. Cf. now the judicious remarks of P. Foulkes, 'Where was Simplicius?', *Journal of Hellenic Studies* 112 (1992) 143.

33. An earlier version of some parts of this paper was given as a lecture to the Society for the Promotion of Hellenic Studies in London, England. A compressed version was read to the conference. Another article based on the original lecture will appear in my *Soul and Intellect. Studies in Plotinus and later Neoplatonism*. Variorum Collected Studies (Aldershot/Brookfield VT 1993).

## The *Sadhana* of Plotinus and Sri Aurobindo

Arabinda Basu

Plotinus and Sri Aurobindo are both mystics. They are also philosophers, though not quite in the same sense. For Plotinus philosophy is a way of life, what in India is called *sadhana*, a way leading the philosopher to a vision of, and union with, what he calls The One. Sri Aurobindo takes philosophy as what it means in the modern world. It is primarily rational, an attempt to think about the nature of reality whatever that may be knowledge, ethics, religion, beauty, etc.

Some philosophers may, and do, construct a system of ideas about these subjects, others deny the possibility of building such a system. Sri Aurobindo, while regarding philosophy as a useful intellectual construction, considers it to be too much indulging in abstractions and hair-splitting analysis of concepts which for the most part do not have much to do with actualities of either existence or of life. Plotinus was very well acquainted with the doctrines of Greek philosophers and was influenced by many of them. Nevertheless for him philosophy was not mainly *theory*, not even *theoria* but *praxis*. The philosopher led a certain kind of life in preparation for a knowledge of the Reality by direct experience.

Though Sri Aurobindo thinks that philosophy is basically rational, when he speaks of the Upanishads, he regards them as intuitive philosophy. What Plotinus regards as philosophy Sri Aurobindo calls *yoga* and spiritual *sadhana*. But this is mainly a matter of terminology. The difference in the meaning which Plotinus and Sri Aurobindo give to the term 'philosophy' should not cause confusion to an intelligent student of their respective systems. Both of them hold that discursive reasoning cannot give direct knowledge of Reality and that whatever faculty can attain that kind of unitive apprehension has to be developed by a moral and contemplative discipline.

Sri Aurobindo's *yoga* is much more complex than the philosophical practices of Plotinus both in its disciplines and in its aims

and objectives. This is mainly due to the fact that his concept of The Supreme Reality of Sri Aurobindo appears more comprehensive than that of Plotinus. I may mention in passing that Sri Aurobindo had not read the writings of Plotinus; yet there are many points of agreement between their respective systems which in my mind furnish eloquent evidence of the universal character of some mystical experiences.

Several comprehensive studies of Plotinus and Sri Aurobindo have been published by Indian and foreign scholars. I do not propose to follow their footsteps. My purpose is to point out briefly the agreements and differences between the yogas of Plotinus and Sri Aurobindo. However, since I have said that Sri Aurobindo's concept of the Supreme Reality is more comprehensive than that of Plotinus, and that that is the main reason for the greater complexity of his *sadhana*, I should say something, however briefly, about the two doctrines of God.

First, as regards the points of agreement. For both our mystic-philosophers Reality is self-existent, ineffable, self-aware. Plotinus says that *monos*, One, does not know itself though it has what he has termed self intellection which Sri Aurobindo describes as self-awareness, beyond the duality of subject and object. It is both repose and dynamic and unity-in-diversity on a certain level of its whole existence.

Sri Aurobindo makes a distinction between self-awareness and self-knowledge in God. Self-aware is what is known in Vedanta as *cit*, Pure Consciousness in Sri Aurobindo's English rendering, in which there is no manifest self-knowledge of God. But in Sat-Chid-Ananda *cit* is also *Cit-Sakti*, Consciousness-Force. It is by this inherent Consciousness Force that Consciousness becomes Self-Conscious. God is both his own subject and his own object containing both aspects in him and yet transcending them. Similarly, he posits a status of God beyond the One which of course Brahman is, though no name can be given to this aspect of God. The term Parabrahman is used to indicate this status of Sat-Chid-Ananda which is according to Sri Aurobindo the first manifestation of the Supreme Reality to awakened human consciousness. He says that the One and the Many are the last two antinomies through which the spiritualised mind of man looks at the Absolute *Parabrahma*. As the Rigveda X.82.6 has it: In the navel of the Unborn the One was placed and there in that One all the worlds abide: *ajasyu nabhavadyekamarpitam yasmin visvani bhuvanani tasthuh*.

Plotinus places the One beyond being (Being in the interpretation of some writers on Plotinus) which however, he is careful to point out,

does not mean that the One is nonexistent. I understand Plotinus' statement to mean that the status of the One is transcendent of that level in which the Many emerge ideally in the Intelligible World, for he employs the term 'being' in regard to this second hypostasis, the nous. If the term 'being' is specifically applied only to the Intelligible-World, then the One is certainly above being. But if the word is employed to indicate that which is the ultimate Principle depending on nothing for its existence, then it can be certainly used for the Vedantic Sat-Chid-Ananda. Sri Aurobindo applies the term to Sat-Chid-Ananda, Being or Existence-Consciousness-Bliss.

Another difference between Plotinus' and Sri Aurobindo's conceptions of God is the following: the former places the Universal principle and therefore the Universe at a level lower than the One, viz. the nous, or Intelligence. For Sri Aurobindo Brahman is Transcendent, Universal and Individual. I have indicated what the Transcendent is in Sri Aurobindo's philosophy. It is beyond not only the universe but also beyond its source; it is however also the All, the Universal. The Universe is an equal extension of the Brahman in which there is yet no individual concentration. But Brahman is also the Individual centration of the Universal God.

Sri Aurobindo describes the Individual Self as the Divine as Individual or the Individual Divine. Plotinus does not speak of any individual self which is an aspect of the One. The individual self first emerges in the Intelligible World, is a content of that world and is itself also (an) Intelligence. Plotinus places the World-Soul below Intelligence and the Intelligible World. Sat-Chid-Ananda is the Soul of the world, the Cosmic Consciousness in Sri Aurobindo's system.

Plotinus distinguishes between the higher soul and the lower soul. Sri Aurobindo would agree with this distinction in principle. But the word soul has a different connotation in his philosophy, which I shall explain presently. Let me just mention here that the soul or the psychic being is an evolutionary entity. Though a portion of God in essence, it is in this world as a being which evolves to the human level from subhuman planes and to its spiritual destiny through many births and through several levels of Consciousness.

Consciousness descends to the many levels of its nature in which it becomes progressively less and less manifest till it reaches that of Matter in which Consciousness is present but completely unmanifest. Of course a

yogi with the right kind of development of his psycho-spiritual means of knowledge can see Matter as a concrete and sensibly seizable form of Conscious Energy, of the Force of Consciousness. While Plotinus in metaphysics considers Matter to be pure negation of being and in ethics as the source of evil, to Sri Aurobindo's spiritual vision, Matter is revealed as the physical vesture of God and the earth as the venue of his unveiled manifestation. This difference in the respective points of view of Plotinus and Sri Aurobindo should be kept in mind, especially when the aim of spiritual life according to the two mystic philosophers is considered. I have said above that in Sri Aurobindo's spiritual vision God is both Plenitude and Plentiful. This description implies that God is both Impersonal and Personal. In Plotinus' doctrine the One is Impersonal and hardly evinces any character of being a Person. In my view this affects his *sadhana* and the fruits of his idea of the state of union with Intelligence and the One, as I shall try to show later. But even on the doctrinal plane the two philosophies are very different in an important respect.

According to Plotinus there is no intention in the One to create the universe understanding the phrase "to create" to mean bringing into being something out of nothing but only the "emanating" of what is already contained in the source of emanation. The world is the product of necessary and spontaneous emanation from the Intelligence as are light and heat from the sun. Sri Aurobindo rejects the view that the world is an emanation from God. On the contrary, it is the product of a deliberate choice on his part to manifest himself as the whole furniture of heaven and earth. Plotinus disagreed with this concept for an apparently good reason, namely, that to wish to create or in Sri Aurobindo's terms, to self-manifest, implies a want and therefore an imperfection. This may be, indeed, is true in the case of finite beings.

But the infinite Plenitude and Plentiful wills to manifest himself not because he lacks anything but because he exercises his super-abundant creative energy to make himself known to beings manifested from his own essential being and nature. He does it for the sake of Delight. For there is a Delight of Being which is the very nature of God and also a Delight of Becoming. If there be a joy in Repose, there is also bliss in Love. Sri Aurobindo says that the selfbecoming of Ishvara does not denude him one iota but leaves him as he always was, is and will be, just as Plotinus says that the emanation does not affect the One at all.

Plotinus has given scant attention to social and political issues. True he has said that political virtues must be developed before one can begin the contemplative life. This corresponds generally to the idea of the practice of *dharma*, in this case by people of a certain order of the society in the Indian scheme of life. Sri Aurobindo on the contrary is intensely interested in the future society as is evident from his book *The Human Cycle*. He has also written a book called *The Ideal of Human Unity*. Both these books furnish ample proof that Sri Aurobindo is convinced that God has a purpose to achieve in the world. The spiritual destiny of the individual human being is sketched out in his *The Synthesis of Yoga* which also describes some of the disciplines and practices of his integral yoga. His idea of the plan of the Divine in the collective, i.e. in society and in humanity is expounded in the two works mentioned above.

Though Plotinus quietly and in a most exemplary manner lived a contemplative and active life, he felt that intellectual and artistic works are a distraction. This certainly is true while a seeker is journeying towards the Intelligence and through that luminous realm, to the One. However, all kinds of work can be done from the state of union with God moved by the inspiration of the Master of Works, be it intellectual, artistic, apparently social and political work. I say 'apparently' because to the *karmayogi* in union with the active Divine, the work he does is fulfilling God's command, though it may appear to others as capable of being brought under human category of mundane works.

Devotion also has hardly any place in the scheme of *sadhana* found in the *Enneads*. The yoga of Plotinus resembles very much the *jñānavoga* as practised in India (actually, it is found in non-Indian mystical disciplines also). But there being no concept of God as a Person who has relations with his emanations or with the individual spiritual *jīvas* in Indian terms, any kind of bhakti-yoga cannot be found in Plotinus' *sadhana*. God is both Impersonal and Personal according to Sri Aurobindo. The yoga of abstractive knowledge leads to the Impersonal aspect, to identity with Brahman as in Shankara or a most close union with the One in Plotinus. Bhakti enables the seekers to have close relation with the Personal.

It is not easy to understand how in Plotinus' idea of spiritual life the souls do not have any kind of personal relation with the One, since their existence is not denied, for if it were then souls cannot be said to emanate from the One at all. True, in one sense emanation from the One is

denied. But this means that the lower self is transcended or in Indian terms the separative ego-sense, *ahankāra* is left behind. But in the yoga of bhakti the higher soul, when liberated from its association with the lower soul, finds its true relationship with God. Sri Aurobindo accepts the possibility of identity, unity-in-distinction and distinction-in-unity with Brahman as viable spiritual states. In his own integral yoga all the three experiences are to be attained and harmonized. This can be done not by means recognized in all mystical disciplines but by what Sri Aurobindo, for want of a better term, has called the supermind.

I have said above that Brahman is Pure Consciousness, self-awareness but also self-consciousness, and self-knowing. God's knowledge of himself is the Supermind. Infinite self-awareness must first translate itself into an infinite faculty of knowledge but also the integral knowledge that God has of himself and of the world his self-manifestation, the method and means of the self-manifestation and its goal. For the cosmic manifestation is moving towards a consummation as foreseen and planned by the Divine. But before I say something about God's purpose in the world, I would like to emphasize that the supramental realisation of God is integral in that one who has that realisation knows God directly as Transcendent, Universal, Individual, Static, Dynamic, Impersonal and Personal, Qualityless, and Qualified, Nameless and all Names, Formless and all Forms.

A capital difference between the respective concepts of the ultimate spiritual destiny of man of Plotinus and Sri Aurobindo is that the founder of Neoplatonism has no doctrine of cosmic evolution while one of the most important doctrines of the founder of the Integral Advaita Vedanta is that he is firmly of the view that God has a purpose in the world in a cosmic way. Brahman, as and through the Supermind, his integral Knowledge-Will and the source of the Universe, manifests himself by a process of downward evolution as a hierarchy of principles of consciousness and being till it reaches the state of the Inconsistent Ocean, of the *apraketa salilam* of the *Nasadyasakta*, Rv. X.129.1-5.

That One, *tadekam* progressively descends through the Supermind. Mind, Life, Psyche, into the state of Matter which is formed out of the unconscious Waters over which the spirit of God broods and moves to bring the world into manifestation. The formation of Matter is brought about so as to provide the stable basis for the progressive manifestation, the upward evolution, of the involved Consciousness. This

thrust of Consciousness or rather consciousness involved in the world, whose essence is less manifest on the different levels of its own involution and evolution, manifests Life and Mind in the world.

The appearance of Mind is really the emergence of Man, the progeny of Manu, Mind. Below the level of Mind, evolution is subconscious; in man it has become conscious. He can choose to collaborate in what Sri Aurobindo describes as the Yoga of Nature, the collective yoga. Yoga is a method of quickening evolution. Subconscious evolution is a tardy movement of universal Nature which in man can make a more conscious and deliberate march towards a further evolution of Consciousness of which the mental is one stage. That higher level of consciousness is the Supermind. In this integral Knowledge-Will there is no diminution of being, consciousness and bliss. It is in effect God as both the material and efficient cause of his self-manifestation as the world.

One of the innumerable powers of God is self-limitation. It is by deliberate self-limitation that the Supermind becomes Ignorance, Avidya, mental Maya. The world is in the grip of Ignorance. It is not a principle and power essentially different from Knowledge. It is from the involutionary viewpoint limited Knowledge and from the evolutionary standpoint developing Knowledge.

Sri Aurobindo holds the view that Consciousness involved in Mind is pressing for a more open manifestation of itself. In other words it is evolving towards the Supermind. When that evolution is accomplished, those who will be supramental souls will live for God and from a state of union with him in Knowledge, Will, Peace and Delight. Their life will be a movement from knowledge to more knowledge and not as man's life is now a seeking of Knowledge from within Ignorance.

It is painfully obvious that Mind cannot control the affairs of the world and the many-faceted life of man and mankind. It therefore cannot be its creator and controller. The supermind is the veiled creator and the hidden principle and power of the life in the world. Whatever is involved must evolve. The Supermind concealed in Mind, Life and Matter must also manifest itself here.

The Will of the Supermind which is full of Knowledge of God and the world is the instrument of bringing about a radical transformation of our ignorant nature comprising Mind, Life and Matter. The ultimate aim of the *sadhana* of Sri Aurobindo is the complete transformation of the physical consciousness in the human body. That is to say, the physical

body of the superman will be fully conscious, vibrant and full of divine peace established in its cells in such a way that their decay will be arrested, their disintegration stopped and consequently death will no longer be inevitable. Instead of being the source of embarrassment and shame the physical body too is potentially capable of knowing the Divine and manifest him in it. There is nothing of this idea and ideal in Plotinus. His sadhana culminates in the passing of the alone to the Alone. In the yoga of Sri Aurobindo the seeker has first to get his own liberation from ignorance and achieve union with God in many modes. He is the lone pilgrim. But he says that to seek one's own liberation is the last act of egoism. The integral yogi's ultimate aim is to realize God on all the planes of being and become a channel of the integral supramental Knowledge-Will for the transformation of consciousness inwardly and of the collective being<sup>1</sup> and life outwardly. The Divine is both Solitary and All. The integral yoga aims at realising God as spirit ensouling a glorified physical body and as the collective Soul, directly guiding a spiritual society in all aspects of its life.

To fulfil God in life is man's manhood, says Sri Aurobindo and fulfilling God means fulfilling his purpose which is manifesting himself in all levels of consciousness and being in the universe including the physical. The life of the supramental community will be a life expressing the Divine in its existence, activities and plays of joy.

### Endnotes

1. The phrase collective being occurs in the *Enneads*. But as I understand it means the intelligible world and not a human society in this world, where we live, more and have our being.

## Plotinus' Neoplatonism and the Thought of Sri Aurobindo

John R. A. Mayer

*"To rest in the apparent and to mistake it  
for the real is the one general error,  
root of all others and cause of all our  
stumbling and suffering, to which man is  
exposed by the nature of his mentality."*

(Sri Aurobindo, *The Human Cycle*, Chapter 5, p. 37,  
Sri Aurobindo Birth Centenary Library,  
Pondicherry, 1971)

The present conference is dedicated to a task in comparative philosophy, namely to compare and contrast two traditions, Neoplatonism and Indian Philosophy. Each of these traditions is rich, with many diverse individual contributors; so that under this heading an almost unlimited amount of scholarship is possible. The present paper represents a reflection about the significance of the fact that there are a variety of philosophies from a variety of traditions which can be explored both for finding similarities and for contrasts which have in common the fact that they can be seen as metaphysical monism. Plotinus' and Sri Aurobindo's thoughts are exemplars, to which references will be made. It is not our purpose herein to present a detailed exposition of the thought of either. Rather, we shall outline our own reflections, which are also informed by phenomenology, post-modernism, and without doubt, by a strong empathy with monism. The significance of the influence of post-modernity on this author is that he recognizes and admits that whatever is meant by the term "truth" may well be beyond coherent rationalization. Therefore the presence of formal inconsistency in the serious articulation of a philosophical position should not be considered an immediate ground for rejection of that claim; rather, it is incumbent on the open listener to attend not merely to the text and its formal characteristics, but when finding an inconsistency, attempt to reflect on the preideational adumbration from which the author writes, and which is addressed by the text, so as to empathize and find meaning in the

expression. Rejection of a position does not signify its falsity; it signifies essentially the failure of the imagination of the rejecter, and the relative lack of success of the communication intended by the speaker. While truth is subjective, and depends on "having the ears to hear", it is not merely private, but is interpersonal, accessible to everyone, provided that the medium of communication succeeds in focusing the attention of the listener-reader to the same "area" from which the speaker-author constructs his address.

Aurobindo Ghose (1872-1950) was given a deliberately European education. In a convent school by age five, he was sent to England at age seven, where he stayed until 1893, eventually studying at Cambridge. He returned to India when he was 20 years old, and only then began to study his cultural heritage. It is therefore clear that he had direct knowledge of Western Neoplatonism as well as of Indian philosophy. It is, however, certain that the Indian intellectual-spiritual tradition was the more directly influential element in his later thought. Once in Baroda, he began to study Sanskrit seriously, and immersed himself in the texts of the Upanishads, the Gita, and the writings of Ramakrishna and Vivekananda. At first he was also involved as a very active nationalist in the political movements of his time, eventually even giving up his post as Vice-Principal of Baroda College in order to be more fully able to participate in the political life of India. It was in the first decade of our century that he gradually withdrew from his political activities in order to pursue his spiritual development. He devoted himself exclusively to spiritual exercises and to philosophical writing for the last forty years of his life, from 1910 to 1950.

Both Plotinus and Sri Aurobindo are authors of speculative metaphysics, in the sense that they have developed and presented in a systematic and thoughtful way their view of the nature of reality. Both of these views may be characterized by the label "monism", in that they identify the ultimate as a singular being, the One or Brahman as the case may be. Both recognize that this singular being is dynamic, involved in a process, that Aurobindo calls the Life Divine. This concern with activity, process, change, evolution and becoming is the reason why their thought in particular is worthy of comparison. Plotinus' monism is in contrast with that of both of his great intellectual predecessors, Plato and Parmenides of Elea, in that Plotinus asserts activity and dynamism on the part of the Ultimate, while the two earlier thinkers denied change or process as appropriately characterizing Being or the Forms. Aurobindo's philosophy

also stands in some contrast with the earlier Advaita Vedanta of Shankara, exactly in the sense that for Advaita change or process is an aspect of *maya* or illusion, while for Aurobindo Brahman is both Being and Becoming. "This absolute manifests itself in two terms, Being and Becoming. The Being is the fundamental reality, the Becoming is an effectual reality. It is a dynamic power and result, a creative energy and working out of Being, a constantly persistent yet mutable form, process, outcome of its immutable formless essence." (*Life Divine*, p. 785 f.)

Our aim in this paper is to demonstrate that in spite of the differences in the way of understanding Plotinus' One and Aurobindo's Brahman, namely that the former conception seems less specifically theistic in its language and envisionment than the latter, we claim that the two systems are compatible, and are but different articulations of fundamentally similar experience. Of course, experience is subjective, and we can have no access directly either to the experience of Plotinus or to that of Sri Aurobindo. However, it is our conviction that articulation and reflection, especially about that which is not strictly and narrowly empirical, is based on an apprehension which is direct, not mediated by thoughts or concepts, but which then serves as a stimulus and guide for articulation and intellectualization. Our claim is fundamentally phenomenological. If we but explore how it is that we give utterance to our thoughts and how our thoughts present themselves to us as plausible, coherent, persuasive and functional we discover that there is a preconceptual adumbration, which guides and forms our reflections which eventually gels into speech or script. Not unexpectedly, our speech and thought patterns are the joint product of this pre-conceptual and root experience and our exposure to our culture, our traditions. From the tradition we extract what seems useful for describing the adumbration; and our audience, our listeners understand our speech or script only to the extent that their experience to some extent confirms what they hear. Otherwise the speech heard will seem to be nonsense, or at least, totally implausible and unconvincing. The fact that monistic speculation has happened in many cultures and many societies is evidence that there is some fundamental experience other than the merely empirical informing us of multiplicity, diversity, differences and particularities. There must be a complementary intuition that however convincing and interpersonal the world of multiplicity is, there is something that is not given in the

empirical appearances, but which we can know just the same. Such an intuition is not merely a private whim, but is widely shared, and it is our belief that with the appropriate discipline and attitude, every person can develop to the selfsame intuition. It, like all intuitions, presents itself as important and meaningful; it might not be directly accessible, yet it will influence the way we open ourselves, and in the way we shape our actions and thoughts, including our speech. This transempirical adumbration is what discloses the meaning in the claim that appearance and reality are not synonyms but rather, antonyms. Reality then is not merely appearance, but is accessible through an intuition that the apparent discloses something that is transcendent to it. How we constitute in thought and language this intuition of transcendence is challenging. However, the very origin of the word "transcendence" and its meaning is evidence of the fact of such an intuition. Given it, one's speculative thought especially concerning metaphysics is deeply influenced. It is this intuition which has lead some thinkers, though not our two, to the belief that multiplicity, process and the empirical domain is merely illusion. In the case of our two authors their contention, grounded in the same intuition, is that the natural world and its empirical multiplicity is not exhaustive of reality, and is not separate from it. What I have called "intuition" presents itself as an intellectual disposition. It is a complex of feeling-thought, which when we discover it in ourselves draws us to an empathetic disposition toward speculative monisms. When we attempt to rearticulate the basis of this tendency, our own speaking or writing is guided exactly by that reality which permits even those paradoxical claims which seem on the surface to be logically inconsistent to be asserted on the one hand, and to be understood on the other. That there are such inconsistencies in the various monisms that we encounter is demonstrable. But these inconsistencies ultimately are not barriers to the acceptance and appreciation of the speculative tradition, they serve rather to intimate the limits of rationality and the less than ultimate adequacy of ideation and language for the fullest expression of the experiences which persuade us of their veracity, their vivacity. Thus every speculative monism has to be somewhat less than crystal clear about the relationship between the One and the Many; the bases of the contrasts within the manifold, if there is ultimately only one substance or being or ultimate. Whether we read Plato or Plotinus, Shankara or Aurobindo, we can spot logical problems in the texts if our openness toward them is characterized by a critical skepticism. On the other hand, if we ourselves

turn to that inner mirror from which we are capable of understanding what we hear or read, and which we use to guide the formulations of our own serious speaking, we are in touch with exactly that anamnestic ground-source of our intuitions and knowledge which Plato desired to redirect us to, which, when we listen to the wisdom tradition, turns out to be not merely private and subjective, but universal, even if it is not always easily accessible, and which in Maharishi Mahesh yogi's terminology is called "the source of creative intelligence". That this is not rational knowledge, but that which lends rationality and plausibility to conceptually formulated claims is clear from all accounts. Therefore, let us now turn to how Plotinus reacts speculatively to the adumbration of the nature of reality from which his philosophy finds its formulation.

While for Plotinus the first emanation of the One is *nous*, or mind; the second, *psyche* or soul, and the third, *physis*, or nature, it would be useful for us to stop and reflect on the meaning of these terms rather than merely translate them from the Greek into their conventional English. If mind and soul are the first two "products" or outpourings of the One, is it plausible for us to think of it as other than Spirit, or Consciousness? Clearly Plotinus avoided both of these terms as descriptives of the One, because he wanted to avoid suggesting any positive descriptions, since each of these would ultimately be intelligible as a limitation, and the One is not limited. However, the tendency to think that the ground or source in the Plotinian conceptualization is impersonal would be a mistake. Now it is true that text asserts the One as being beyond all distinctions, including the one of personal and impersonal. Our tendency, therefore, is to think that the answer to the question "Is the One personal?" should be negative. But the answer to the question "Is the One impersonal?" should be exactly the same. Thus if our imagination is limited to thinking either in terms of personal or impersonal, then the negative answer to the question about the personal nature of the One should not draw with itself the implication of the impersonality of the One. The fact that the first two emanations have characteristics that are more to be associated with subjectivity, consciousness or mind suggest that the One is more proximal to Mind than it is to mere objective existence. Thus Plotinus' philosophy is not to be understood as radically differing from that of Aurobindo.

Aurobindo, on the other hand, calls the ultimate Brahman, and sometimes refers to it as "Supermind". This ultimate is characterizable by three diverse human perspectives. The Transcendental, the Universal and the Individual. It should be clear that each of these three characterizations is dependent on the human perspective from which whatever is transcendental is transcendental, and so forth. Aurobindo suggests that human liberation, *moksha*, is the destiny of the Individual, producing the inevitable emergence of a developed society, functioning through the operation of the principle of love, and the purpose of the evolutionary process. From matter to life, to mind, to Higher Mind, Illumined Mind, Intuitive Mind, Overmind and Supermind. All this is understood as a seamless process, the reversal of the original involution of Brahman into unconscious matter. Here Aurobindo's teaching seems to coincide with that of Hegel. Hegel suggests that the dialectical process initiates itself by the Absolute as pure abstract Spirit, othering itself from itself into its opposite, concrete, unconscious matter, and thereafter each of the separated elements strives to unite itself with its opposite. Matter becomes conscious, first in life, then in selfconscious life, while spirit expresses itself into matter as art, culture, civilization. The restoration, or synthesis is an elevated reintegration of that which originally cleft itself from itself into otherness.

In Plotinus also, we have the presentation of the reunion of the original overflow or emanation. While reason and intellect serve to guide the way back as far as *nous*, beyond *nous* to the One reason and intellect no longer suffice, as the satisfactory means for the restoration. Only love is the sufficient means of effecting the full return. This Plotinian description is indeed similar to Aurobindo's claim that surrender is the only means to achieving the higher stages of the evolutionary process. The ordinary mind and ordinary intellect, however useful they may be in some spheres, are not adequate to this task. But the end of evolution is not the elimination or destruction of the lower stages; rather it is the harmonious integration of all into a mutually interpenetrated whole, characterized by Satchitananda. Multiplicity, even though it is a less than complete appropriation of the way reality is, is, however, not unreality, but the very way of the Brahman self-manifesting in all its varieties and richness. Thus motion, change and history are not illusions, they are of the way of the Being of the One, which is in fact dynamic, processual, and in a continuous and emergent partial self-disclosure, whose characteristic feature is intensification; the

emergence of fuller, more complete and more integrated self-disclosure, which transcends but does not deny process. Multiplicity and particularity does not exclude its simultaneous unity and co-participation in the totality and oneness of Brahman.

Parmenides, as is well known, has maintained that motion and change are but illusions. The real is eternal and unchanging. Zeno, an Eleatic Parmenidean, has developed this thought further, demonstrating the rational unintelligibility of motion and change, and using his paradoxical conclusions as evidence and persuasion for the rejection of the apparent as the basis for truth. It was the analogous paradox concerning the reality of identity and an unchanging substance as expressed by Heraclitus in his famous dictum that one can never step into the same river twice, which contributed to Plato's formulation of his own metaphysics, which can be considered as a reflective synthesis of the Parmenidean denial of change and the Heraclitean assertion of the universality of flux. Traditional Platonism though dynamic even within Plato's own corpus of writings, can be characterized as a kind of two storey universe, with the priority being given to the permanent and unchanging, perfect realm of Forms, under the primacy of the Form of the Good, the True and the Beautiful, all aspects of the same single supreme. Time, the moving shadow of eternity, characterizes a lesser domain, the chaotic unformed, which in its striving to emulate the eternal, gives form to matter, which however, forever fails in its attempt to mirror the Forms because of its debilitating limitations as matter. Materiality prevents the temporal realm from being a perfect reflection of the Ideal, thus resulting in the flux of temporality in its ceaseless effort to more adequately mirror the perfect formal original. Thus change, process, characterizes only this lesser domain, which serves as but an imitation, and an unsuccessful one at that, of the higher true being. Knowledge of the Form of the Good is possible in the Platonic envisionment, but the full formulation and articulation of such a knowledge is elusive, even if formulations are inspired by the unformulated and only partially accessible possession of exactly that which stimulates us in the further search and attempt to know and speak it, as well as to act and live in its service. Plato never makes clear how he understands the original nature of the chaotic, the character of unformed matter, and the reason that human souls find themselves embodied and mired in the temporal domain. His hint is that the soul becomes embodied in consequence of some sort of wrongdoing, though this is problematic.

For if the soul is originally a preexistent in the domain of the eternal, then in fact it cannot be active, it cannot be engaged in "doing" of any sort, much less in wrong-doing. If the soul is originally, even prior to physical embodiment somehow different from the Form of the Good, and in being a lesser Form, subservient to it, then these lesser forms are not wholly forms at all, because they are active. Thus Plato's philosophy, though inspired to some extent by a monism, cannot be thought of as consistently monistic. Plotinus, in transforming Platonism into what is now known as Neoplatonism rejects the inertia associated with the Platonic ultimate, and suggests the notion of "emanation" as a basis of the emergence of multiplicity and differentiation. However, this emanation or overflow of the One is balanced by the need and desire to return and reunite with the One that characterizes particular beings, *physis*, *psyche*, and *nous* alike.

However, Plotinus' speculative thought is much more explicitly monistic than Plato's. What interests us here is how it is possible that in spite of the evidence of multiplicity and the apparent manifoldness of the world of conventional experience, both some sages, but even more surprisingly, many ordinary and common folk have a strong inclination to doubt or reject the ultimacy of the apparent manifold, and generate arguments as well as accept claims of the transempirical reality of the singularity of the ultimate, in which we each live move and have our being.

Monistic philosophies have arisen from different cultural and intellectual backgrounds, and it is my belief that these have often developed in relative independence from one another. Also, it is the case that a variety of speculative monisms have not only been formulated by thinkers, but have found sympathetic and admiring followers. How are these facts to be understood? Why is it that the "natural standpoint" from which it is persuasive that there is an "out there" world of many diverse things has been questioned and rejected in favour of philosophies which assert that the apparent multiplicity of the seemingly independent entities is not the final perspective; rather, that the truth of the matter is, that this vast diversity of appearances all belong together, and are aspects of a "One" which is the ground, the source, the ultimate reality; to which all belong, and from which they are never really sufficiently separated to make the "return" a merely temporal future event. In truth the separation and "descent" is coextensive with a transcendent unity, in which the separations are but perspectival differences. Time is the requirement

primarily for the acquisition of the wisdom to realize the truth of the unity of Being. While that wisdom is occluded from the apparently individual consciousness of the not-yet enlightened being who glories in his/her separateness and individuality, such a glorying is but a moment to be overcome in the growing development of the individual who is eventually to see through the vanity of his individuality.

But where do we get such ideas from? And why are they appealing at all? Surely prior to any and every theoretical and articulated monism there must be some personal, existential adumbration of the notion that things are not what they seem, or that there is more to the ultimate nature of things than meets the ordinary consciousness of the ordinary human beings. A sense of the interdependence of all, of the belonging together not only of the many synchronous entities, but the belonging together of all throughout all time, time past and time future is part of a sensibility which may not be equally and universally accessible to all human beings, but which is sufficiently common and regular in a culture-independent manner as to generate the diversities of monistic philosophies such as those of Spinoza, Shankara, Plotinus, and even such early figures in the Western tradition as Thales and Anaximander.

For to understand the famous fragment of Thales that all is made of water, we must not interpret this to be a shallow and naive materialism; rather, it is the sophisticated insight that what we know as water can take on many distinct and diverse forms, be these solid as in ice or frost, liquid, as is the case of the primary sense of "water", (and here we should remind ourselves how different a river is or a lake from that little vesselful which we drink for our sustenance, or that liquid in which we render most of our raw foodstuff edible and digestible), or gaseous, as in steam or cloud or fog or mist. Indeed, if all is made of water, the clear liquid we associate with the term is not distinctively any more "water" than is any and every other thing. This is why Anaximander's renaming of the single ultimate as the "*apeiron*", or boundless, is indeed an intellectual advance in description even if not in the basic insight of the ultimate unity of being. Furthermore, even the modern realistic materialist will admit a universal "substance", namely matter, as the invariant "foundation" of items as diverse as the Rock of Gibraltar, the gentle breezes which melt the winter snows, and the body of a living human being, such as myself, or that voluptuous "Other" for whose smile and gratitude even the labours of Hercules would gladly be undertaken. Thus the so-called "Absolute

Idealism" of a Bradley is not the only kind of intellectual system which has been developed in consequence of the surmise of the illusory character of the sheer multiplicity and apparent independence of what the Taoist has called "The Ten Thousand Things". Indeed the fact that the problem of the One and the Many has been recognized as one of the core issues of philosophical reflection is evidence that there is a lure of the One not only for the mystic or the scholar of Neoplatonism, but even for all who would use language, and name two distinct moments by the same name. It is this insight which inspired the famous Heraclitean dictum "You can never step into the same river twice". Thus the very fact that humans have a proclivity to language, to speaking, to naming, to claim identity with those former moments which we conventionally call "my" childhood, "my" biographical data, is evidence that there is unity in the very heart of multiplicity and diversity. The very notion of difference hinges on non-differentiation. Thus when I claim that this thing differs from that thing, and insist on the truth of that claim, the very claim is made against the horizon of the thingness of both this and that, in other words, that behind their differences there is also a commonality!

Prior to all speculation, prior to all theorizing, there is an irreducible and prearticulate awareness of transcendence, of unity and of the mutual interdependence of the multiplicity of particulars. It is this which grounds the theorizing, the rational articulation, the specification of the doctrines which are the features of a variety of schools of thought. Our task as philosophers is to read carefully, openly and sympathetically those texts of the traditions which seem to address us, and to learn from them, and at the same time to reformulate and integrate them into the very stuff that constitutes our own life, actions and thoughts, and which will nurture the heritage for its evolutionary goals.

## The Theoria of Nature in Plotinus and the Yoga of the Earth Consciousness in Aurobindo

Daniel Kealey

The word "contemplation" usually brings to mind techniques to facilitate the return to Source, God, Brahman, the One, and this association is usually correct. But it can also connote the apparently opposite movement. That is, contemplation is not only the way by which the lower returns to the higher, but the way the higher forms, and interacts with, the lower. It is the added consideration of this second meaning of contemplation that constitutes an integral view of the spiritual life. The integral view is not missing from Plotinus, even though he and his interpreters have emphasized the one-way ascent to the heights. My intention here is to resuscitate this integral reading of Plotinus and, as an aid to my reading, I will invoke the vision of the great philosopher and yogi of Integralism, Sri Aurobindo. I will not be simply comparing these philosophers. Better scholars than I have already done so. Dr. S. K. Maitra has written a very informative comparative essay in his book, *The Meeting of the East and the West in Sri Aurobindo's Philosophy*, and Professor Pritibhushan Chatterji contributed an illuminating essay on these two luminaries in *Neoplatonism and Indian Thought*.

Plotinus inherited Plato's ambivalence about the value, significance, and purpose of material existence, on the one hand expressing the negative regard towards the body as found in the *Phaedo*, and at other times expressing the positive regard towards material existence as the manifestation of the Divine, as found in the *Timaeus*. It is in these positive views (*Ennead* IV. 8, for example) that we find the integral Plotinus. It is my impression that Plotinus had an integral vision, and he did give it some intellectual expression in his system, but that his will did not fully go along with the vision. I would venture to say, furthermore, that this ambivalence which Plotinus inherited, has been inherited by us. This is a problem we all struggle with to one degree or another.

Our will is wounded, or it behaves as if it were. The spiritual traditions of both East and West have, for the past 2500 years at least, fallen prey to the mood of resentment. Resentment, as revealed by Nietzsche and Scheler, is an attitude that rationalizes our unwillingness to accept the highest and noblest vision of the good life available to us. That vision of nonduality discloses the essential divinity of material existence and our mission to manifest this in our lives here. Because of the difficulties and the frustrations we have faced in this mission, we recoil from the task of manifestation and seek instead to fulfill some more manageable agenda. That these "manageable agendas" have tended to be different in East and West should not obscure the fact that they are fundamentally the same reaction of unwillingness to embrace the life of integral nonduality. Whether we are talking about Plotinus's flight of the alone to the Alone, Christian redemption, the dualism of Samkhya-Yoga, the negation of Maya in Advaita Vedanta, or the modern obsession to conquer nature through science and technology, we are talking about the same rejection of the divinity of material existence.

Seen in the context of this pathology of consciousness universal to the human race, the advent of Sri Aurobindo's Integral Nonduality is, at the very least, a hopeful sign of healing. I would even go so far as to suggest that Sri Aurobindo's personal attainments are an attempt on the part of undivided Divine consciousness to introduce a new force of healing into the fractured state of human consciousness. It is in this spirit of healing and integral nonduality, then, that I will turn to find those elements in Plotinus that resonate closely with this vision of wholeness. I will do this by focusing on Plotinus's concept of *theoria*, or contemplation.

Since it is nonduality that we seek, we must find what it is that bridges the fundamental dichotomy of subject and object. In Plotinus it is contemplation which links each level of reality with its corresponding level of consciousness (except in the case of the One which transcends all differentiation). Plotinus not only links the subjective and objective poles of reality in this way but states further that these subjective sides of reality are ontologically prior to their objective manifestations, these latter being likened to poor images of their archetype. Plotinus called the states of consciousness *theoria*, contemplation, and their objective manifestations *theorema*, which can be translated as either work of contemplation, object of contemplation, or result of contemplation. The world as *theorema* is the product of contemplation. But the world stands to

contemplation not only as product, for it too contemplates. To one degree or another all things contemplate and aspire to contemplation. This is the thesis by which Plotinus begins his treatise "On Nature and Contemplation and the One."

Suppose we said, playing at first before we set out to be serious, that all things aspire to contemplation, and direct their gaze to this end not only rational but irrational living things, and the power in plants and the earth which brings them forth and all that attain to it as far as possible for them in their natural state, but different things contemplate and attain their end in different ways, some truly, and some only having an imitation and image of their true end could anyone endure the oddity of this line of thought?<sup>1</sup>

Interestingly, Plotinus proposes this thesis as a play. Play is here proposed to be a more effective means than is seriousness for leading the inquirer into the experience of contemplation, and this probably for at least two reasons: 1) it encourages the use of imagination, and 2) it frees the mind from more or less exclusive concentration on the given conditioned sensuous aspect of objects so that the playful nature, of the world in its wholeness can be fully participated in. In any case, an argument over whether seriousness or playfulness is the best approach to realize the truth should not distract one from the point that "one plays and the other is serious for the sake of contemplation."

This accent on play is also found in Aurobindo's philosophy. This Lila, or Divine Play, is not to be understood as an arbitrary imposition of a wanton God sadistically enjoying the sufferings of creatures made to dance according to His bidding, but is rather the perception of creation as a mutual agreement between the Divine Purusha and all individual Purushas.<sup>2</sup>

If we look at World-Existence...in its relation to the self-delight of eternally existent being, we may regard, describe and realise it as Lila the play, the child's joy, the poet's joy, the actor's joy, the mechanic's joy of the Soul of things eternally young, perpetually inexhaustible, creating and recreating Himself in Himself for the sheer bliss of that self-creation, of that self-representation Himself the play, Himself the player, Himself the playground.<sup>3</sup>

Seeing creation as play automatically shifts the perspective on life away from the serious business of escaping the tragedy of the cosmic fall or mistake to one which sees oneself as a co-creative participant in the Divine Unfoldment.

Actions, writes Plotinus, are a "shadow of contemplation and reasoning" (III.8.4). People engage in action and have their minds distracted by the purely superficial aspects of manifest action because "their souls are weak and they are not able to grasp the vision sufficiently, and therefore are not filled with it, but still longing to see it, they are carried into action, so as to see what they cannot see with their intellect" (III.8.4).

By exhorting us to see action as a shadow or image of contemplation, Plotinus is encouraging us to awaken a symbolic mode of knowing. A symbolic mode of knowing would try to understand actions as images of a higher life concealed in their working as their essence and origin. Of the different forms of symbolic knowledge, Plotinus spoke highly of the power of art to lift the Soul with the wings of beauty. Beauty is the domination of matter by Form, or Form made visible to the sensitive soul. Even the weak soul sunk in the dissipated consciousness of sensual action can be stirred by the power of beauty of bodies, images, music and excellent actions. Beauty is something which the soul becomes aware of even at the first glance and recognizes and speaks of it as if it understood it already (I.6.2). It welcomes beauty and adapts itself to beauty as if it recognized beauty to be of the same nature as itself. Sri Aurobindo views on Beauty are nearly identical:

Beauty is the special Divine manifestation in the physical as Truth is in the mind, Love in the heart, Power in the vital.<sup>4</sup>

The search for beauty is only in its beginning a satisfaction in the beauty of form, the beauty which appeals to the physical senses and the vital impressions, impulsions, desires. It is only in the middle a satisfaction in the beauty of the ideas seized, the emotions aroused, the perception of perfect process and harmonious combination. Behind them the soul beauty in us desires the contact, the revelation, the uplifting Delight of an absolute Beauty in all things which it feels to be present but which, neither the senses and instincts by themselves can give, though they may be its channels for it is suprasensuous nor the reason and intelligence, though they too are a channel for it is suprarational, supra-intellectual but to which through all these veils the soul itself seeks to

arrive. When it can get the touch of this universal absolute Beauty, this soul of Beauty, this sense of its revelation in any slightest or greatest thing, the beauty of a flower, a form, the beauty and power of a character, an action, an event, a human life, an idea, a stroke of the brush or the chisel or a scintillation of the mind, the colors of a sunset or the grandeur of the tempest, it is then that the sense of Beauty in us is really, powerfully, entirely satisfied. It is in truth, seeking, as in religion, for the Divine, the All-Beautiful in man, in nature, in life, in thought, in art; for God is Beauty and Delight hidden in the variation of his masks and forms.<sup>5</sup>

Turning again to Plotinus we find that beauty and soul are related in so far as they are both productions of Form. It is the participation of the things of this world in Form, which have their station in *Nous* (Intellect, sometimes, under influence of the German *Geist*, translated as Spirit), that endow the things with beauty. The more completely a thing participates in Form the more the beauty inherent in Form is manifested in its recipient nature. Conversely, the less a thing is dominated by Form, the more ugly its appearance. In the Platonic tradition Form is reality or Being. Truth, Beauty, and Goodness are the chief characteristics or Forms of Being and, consequently, the more a thing participates in, or partakes of, the experience of Being, the more it will exhibit these characteristics. "Beautifulness is reality" (I.6-6). Both Soul and the things it contemplates as beautiful or ugly have their common origin in the One, the source of Being. Intellect (*Nous*) is the One's first emanation or hypostasis in Being. Plotinus sometimes refers to *Nous* as God, that which is most like the One under the condition of the Many. The one is beyond Being, or beyond God. Hence, the true beauty of the Soul is to be found in its own highest being which is the Intellect; and to the extent that it is perfectly conformed to Intellect, says Plotinus, so is it truly soul. "For this reason it is right to say that the soul's becoming something good and beautiful is its being made like to God, because from Him come beauty and all else which falls to the lot of real beings" (I.6.6).

To posit that manifestations of beauty (the objective) and souls (the subjective) are alike by virtue of a common third element, Form, only gives us a static, logical explanation which is insufficient for portraying the more dynamic aspect of their relationship. In the treatise "On Beauty" Plotinus portrays the dynamic (*dunamis* in Plotinus is the contemplative power of Forms) relation as one of a procession of Beauty from the One

(which is also characterized as the Good) to Intellect, where it is recognizable as Beauty, and which, in turn, gives beauty to soul, the second hypostasis. Everything else below the purely psychic (Soul) dimension is beautiful by the shaping of Soul. In fact, Soul tries to make everything it grasps and masters beautiful (I.6.6). The psychic dimension refers not only to individual human souls but to the World Soul or Cosmic Soul and to pure disembodied (abstract) soulness alike, although the latter is sometimes identified with *Nous* by Plotinus. In any case, beautifulness is soulness, and the beauty of this world is a reflection of Soul or the imprint, of Soul, which by the power of Forms that inhere in it, gathers the dissipated and relatively unformed matter (theoremata deformed by lapse of time) into organized wholes which, relative to their less formed parts, are beautiful. Thus, whether the beautiful thing is a work fashioned by a human soul or a natural beauty fashioned by the World Soul, the beauty is in each case the work of Soul and an image of soulness. When a human soul experiences beauty it is, consciously or unconsciously, actually being stimulated by universal soulness; it is suddenly edified by its own nature which is beautiful. We might ask here, why is it that if Soul is beautiful it needs to be reminded of its inherent beauty by an extraneous sort of beauty?

The chief characteristic that differentiates Soul or Psyche from *Nous* is duration or time. *Nous* is non-durational or eternal (notwithstanding Plotinus' various contrary assertions, which he tries to justify as necessarily paradoxical, the logic of the Divine transcending the logic of science), and as such is omniscient and omnipresent, having all contents of knowledge altogether at once, which constitutes perfect contemplation. Soul, however, is unable to maintain that intellectual quietude necessary to reflect the whole at once, for it has a "restless power" which does not want, or cannot have, the whole to be present to it altogether, but prefers to experience the whole successively in one form after another in an infinite number of different ways. By thus dividing up, measuring the illimitable it loses its integrity and dissipates the unity of the whole into ever weaker extensions and part-formations. Soul thus betimes first itself and then reality; time is the life of the Soul (III.7.11).

The Soul's activity of "betiming" is also a work of art, for the reality which has been worked or betimed is an image of what is before time, the eternal Forms of Intellect. Time for Plotinus, as it was for Plato in the *Timaeus*, is the moving image of eternity. Time is the One

contemplating under the limitations of Soul. Soul's contemplation is temporal. The essential character of the Soul's activity is contemplation of the whole under particular temporalized Forms. However while its essence (in any particular instance) is the whole under a particular temporalized Form, the Soul's contemplation is inherently distracted and cluttered by its own past acts of contemplation.

The cluttered state of mind is a problem for Soul because the intuitions of different times are not completely conformable to each other, each being the contemplation of the whole from a different perspective. An act of contemplation in the present cannot be isolated from past acts of contemplation which help constitute the present one and which thus render it as ambiguous or over-determined. This problem obtains only under the condition of time, because for the Soul which is conformed to Intellect there would be no past acts of contemplation, Intellect being beyond severed time. At the level of Intellect, therefore, the Platonic concept of recollection would not make any sense. On that account Plotinus replaces recollection with direct intuition. Noetic intellection is beyond time, and so memory is not in order there, for all is present. "Intellect, therefore really thinks the real beings, not as if they were somewhere else; for they are neither before it nor after it" (V.9.5). There is no ambiguity in noetic intellection.

The embodied soul, however, must rely on memory in the attempt to compensate for its weakened intuition. Memory is a Soul power (*dynamis*) which weakens in direct proportion to the soul's degree of absorption in the sense level of experience. The soul's power is fully actual in Intellect, but when embodied its actuality loses ground to potentiality, which is a more passive state of being. The more the soul is merely passively perceiving and remembering the superficial appearances of things, the further it strays from seeing things in their real being. Soul only knows things completely and fully in Intellect, which is to say, when it perceives their eternal being as identical with its own being. Such knowing also constitutes the soul's actualization of its power and this, notes Plotinus, confirms Parmenides' alleged statement that "thinking and being are the same thing."

Thus the soul self-limited to perceiving instrumentally through the senses is blind to real beauty, and can see only its faint reflection, matter. In order to perceive real beauty the soul must develop a "passionate love for the invisible" (I.6.4). This passion of love, *eros*, seems to be a

necessary predisposition that renders the soul receptive to the ubiquitous but otherwise hidden splendor. Plotinus adopts Plato's philosophy of eros, with some minor differences. Eros in Platonism is not just a passion of deficiency seeking for satisfaction but is also a logos, which is to say that it is not merely a passive potentiality but is partly an active *dunamis* by virtue of its constitution as an expression of a rational principle; a delegate, as it were, from the Intellect in the world of embodied souls (to adapt a phrase from Aurobindo). Love is not merely a delegate, however, even though it often forgets itself and becomes enamored of superficial beauty. Ultimately it is of the very essence of reality. The Good, for Plotinus, is not only lovable, *erasmion*, but is eros. "He is at once lovable and love and love of himself" (VI.9.15). Hence for the Soul eros is not merely the conveyance towards the Good, upon the attainment of which eros is dropped, but is, the end and perfection which the soul will conform to eternally (VI.7.22).

While Soul is naturally attracted to beauty, it is beauty in conjunction with goodness, which inflames love. Beauty without goodness may either mislead the soul towards, and entrap it in, the non-being of externality (I.6.8; V.5.12), or it may leave the soul cold and unenthusiastic with a mere passionless attraction (VI.7.22). This applies equally to intelligible as to physical beauty. The attraction exercised by the Good is primal and ubiquitously constant (because it has all power), whereas the attraction exercised by beauty is of a derivative power, not as deep and is intermittent and relative. The power of the Good to attract need not be perceived to be effective, and it is always at work, whereas the power of beauty can only be effective when perceived (V.5.1.2). Beauty, then, functions most appropriately when it is a means of experiencing an even deeper level of being, namely, the Good:

Just as with bodies here below our desire is not for the underlying material things but for the beauty imaged upon them. For each is what it is by itself; but it becomes desirable when the Good colors it, giving a kind of grace to them and passionate love to the desirers. Then the soul, receiving into itself an outflow from thence, is moved and dances wildly and is all stung with longing and becomes love and is truly winged (VI.7.22).

True eros is the love of the Good, a love which carries within it its own principle of purification and perfection. It is a logos, and as such is

deeply connected with the reality underlying all things. The more life a beautiful object possesses, the more beautiful it is because life has "soul, and because it has more the form of the Good; and this means that it is somehow colored by the light of the Good, and being so colored wakes and rises up and lifts up that which belongs to it" (VI.7.22).

The beauty of physical objects, then, is a reflection of the beauty of the Forms. But in the Intellectual or Spiritual world of the Forms themselves, Plotinus argues in VI.7.32, beauty is not just one Form as a part amongst others, but must be that which generates Form; and that which generates Form is the principle of Form and as such must be formless. Consequently,

when you cannot grasp the form or shape of what is longed for, it would be most longed for and most lovable, and love for it would be immeasurable. For love is not limited here, because neither is the beloved, but the love of this would be unbounded; so his beauty is of another kind and beauty above beauty. For if it is nothing, what beauty can it be? But if it is lovable, it would be the generator of beauty. Therefore the productive power of all is the flower of beauty, a beauty which makes beauty (VI.7.32).

"How, then, shall we find the way?" asks Plotinus in introducing the method of contemplation. "Let him who can, follow and come within and leave outside the sight of his eyes and not turn back to the bodily splendors which he saw before. When he sees the beauty in bodies he must not run after them; we must know that they are images, traces, shadows, and hurry away to that which they image" (I.6.8). This gives us a brief sketch of Plotinus's practical instructions on the method of contemplation. Already we begin to see his failure to carry through with his vision and a tendency to resort to a one-way ascent by way of the *via negativa*. The essential point, however, is that external looking at beauty must be complemented by internally-directed looking.<sup>6</sup>

This seeing inwardly, the seeing of beauty within one's own soul, is not a mere passive looking, but an active intervention, an education or drawing out of potential beauty, a process Plotinus likens to "working on your statue" till one sees the "divine glory of virtue" shining within oneself. Working on oneself could be understood as developing one's power, or actualizing one's potential. In the matter of the affections this would involve transforming them from their merely passive states (i.e.,

purely reactive to external situations) into active states, of which love is the primary exemplar (III.5.7). An active affection is one which most exhibits the higher Soul qualities, and these qualities are Soul expressions and reflections of the perfect contemplation of *nous*. Affections are more real and active the more they arise from the unitive level of Soul, which is to say, the more they approximate the contemplative power of *nous*.

Plotinus's views on beauty and love illustrate the sort of symbolic knowledge that he is encouraging philosophers to bring into play when, for example, he exhorts one to see physical objects as shadows of a greater reality. Because it involves faculties usually excluded from "serious" knowledge, (i.e., the passions, imagination, moral and aesthetic sensibility), Plotinus's theory of knowledge goes beyond the prevalently cognitive views philosophers tend to have of knowledge. That is so in that he does not ground knowledge in sense perception, as do empiricists, nor in the laws of reason, as do rationalists, but finds the source of knowledge in the transcendent One whose act of knowledge is identical with himself. True knowledge is undifferentiated absolute identity. This super-knowledge, if it can still be called knowledge, is the perfection of knowledge. The nisus of knowledge on all levels of being is towards identity which is complete knowledge. The standard by which the degree of truth of any knowledge is measured is the identity of the knower and the known: knowledge is truer as knower and known become more identical.<sup>7</sup>

The primary model of knowledge so-called, however, is *nous*, because in *nous*, there is plurality and differentiation, conditions usually presupposed for the possibility of knowledge. The differentiation in *nous* is not opposed to unity, but expresses unity in the most perfect degree possible for any multiplicity. The simplest difference that can be generated from the absolute unity of the One is that between contemplation of the contemplator and the contemplated, *theoria* and *theoremata*. In its origin this difference is a mere difference-in-unity, for in *nous* the contemplator or contemplation, "must be the same as the contemplated, and Intellect the same as the intelligible; for, if not the same, there will not be truth; for the one who is trying to possess realities will possess an impression different from the realities, and this is not truth. For truth ought not to be the truth of something else, but to be what it says" (V.3.5).

By identity of *theoria* and *theoremata* Plotinus means not the overpowering of the latter by the former, as in epistemological idealism, but that the *theoremata* contemplated are themselves also *theoriai* or

contemplations of the whole. If *theoremata* do not become identical with *theoriai* then they remain merely objects in another subject and, even if living objects, they would not be self-living. In *nous* all is self-living, for *nous* is the fullest life (III.8.8). Plotinus employs images to depict this highest level of contemplation in order to provide the soul with some contemplative aids, though these images can only give an external representation which must be "dematerialized" to allow the identification of the soul and what it is contemplating to be realized. For example, Plotinus likens *nous* to "something all faces, shining with living faces" (VI.7.15). Each "face" or Form is a particular power, which makes *nous* a multiplicity, yet each is all and in perfect harmony with the whole because identical with it (which makes *nous* also a perfect unity) even while remaining a part. *Nous* is perfect unity-in-diversity. Each maintains the appearance of a part, "but a penetrating look sees the whole in it" (V.8.4). This heaven world of *nous* is not another place, but as the last quote makes clear, this very world of appearances seen with complete penetration. So heaven is this world of men, animals, plants, sea and earth, but now seen in and as *nous*, heavenly.

All things There are transparent and there is nothing dark or opaque, everything is clear, altogether and to its inmost part, to everything, for light is transparent to light. Each There has everything in itself and sees all things in every other, or all are everywhere and each and everyone is all, and the glory is unbounded. The sun There is all the stars, and each star is the sun and all the others. One particular kind of being stands out in each, but in each all are manifest (V.8.3).

Since heaven or *nous* is this world as experienced in perfect contemplation, there is no type of appearance "here", however lowly or loathsome, that cannot be "saved". This is to say, every existent can be experienced as having inherent divine value, but the degree to which the inherent value of things can be known depends on the degree of one's contemplative intuition. To see all things as heavenly, as the living substance of God, is not to collapse the value distinctions of all things into a single value. Distinctions in value remain on the surface of each being, in their appearance, even though in their common depth they are seen in and as oneness. Differences in value are "according to their nearness to the first principles". Hence a god is greater in value than is a man or animal because more totally *nous*. Even an irrational and animate thing is a living

thought in Intellect, and since at a deep level theoremata are identical with theoria, "is a particular kind of *nous*," and as such does not cease to be *nous*, and as *nous* the *nous* of all, although in a particular way.

For it is actually one thing, but has the power to be all: but we apprehend in each what it actually is: and what it actually is, is the last and lowest, so that the last and lowest of this particular *nous* is horse (for example), and being horse is where it stopped in its continual outgoing to a lesser life, but another stops lower down (VI.7.9).

An important consequence of perfect contemplation, where the contemplated is the same as the contemplation or where thought and being are the same, is that whatever is thought "There" necessarily comes into being. Simply by being what it is, contemplation, *nous* produces. *Nous* does not intend or choose to create; yet if the intelligibles subsist, the sensibles will ensue from a necessity inherent in contemplating intelligibles (VI.7.8). Contemplation, *theoria* is at the same time production, *poiesis*. In this respect *nous* imitates the infinite, supremely active *dyonamis* of the One whose formlessness is productive of all Forms and hence of the existence of all things. Plotinus emphasizes that this outflow of Reality from the One is not the work of a Creator, nor a matter of chance, but is rather a spontaneous but perfectly natural expression of the nature of the Origin, and is without temporal beginning or end. As a natural expression of the One the procession of Reality, cannot terminate until everything that could possibly come into existence on all the levels of being has actually done so. Each of these levels, furthermore, must be complete in its turn: *nous* containing the totality of being in a timeless eternity, Psyche or Soul under the conditions of temporal succession, and sensible Nature under the conditions of spatial extension.

*Poiesis*, the productive aspect of contemplation, is in another view *toima* the impulse of self-assertion. The self that is asserting its desire for existence is always a part of its originary context. Plotinus tends to see this toimaic aspect of contemplation as regrettable, but not to the extreme extent of the Gnostics for whom the concept was equivalent to the principle of evil. In any case, he leaves out this "moment" of contemplative production (i.e., the self-assertion) from his model of *poiesis*, according to which the best action is accomplished by the non-action of resting in oneself. "But that true All is blessed in such a way that, in not making, it accomplishes great works and in remaining in itself

makes no small things" (III.2.1). In moral works this principle is followed by and exemplified in the highest type of man who always does the right thing immediately and spontaneously without having to think about it. That is because his soul is intimate or united with *nous*, and in *nous* action and contemplation are identical, and thus in perfect equilibrium.

Sri Aurobindo places much more emphasis on this constructive work of the Way, and we see it in the importance of Karma Yoga in his system where it serves far more than the traditional purpose of mere return, becoming an expression of Divine will and action on earth. The reason why Plotinus emphasizes the "return" moment of contemplation (which is self-negating, the *via negativa*) over the toimaic moment of self-assertion, is that with the descent of soul the former wanes while the latter waxes in strength, and philosophy must endeavor to bring these powers back into balance. Moreover, since the outward movement of self-expression happens more or less spontaneously, the key to right action is the controlling, forming element of contemplative vision, the depth of inwardness determining the rightness of outward action.<sup>8</sup> From an Aurobindonian point of view, however, it is erroneous to think that manifestation will happen automatically, for if the human will is not aligned with Divine purpose, then the creative self-expression of the Divine will be blocked and distorted in those areas where humans are called to be co-creators with God.

As contemplation weakens, the gap between theoria and theorema, contemplation and action, becomes more marked, to the point where contemplation becomes absorbed by outer action, where action, the contemplated, becomes for all practical purposes the only form of contemplation. That is why Plotinus calls action at this level a mere shadow of contemplation. Even though it is a straying from contemplation, however, action never leaves contemplation entirely behind and tries to return to contemplative intimacy by producing works which will be enjoyed by contemplation. Works are performed ostensibly for the preservation and enhancement of self-existence through a process of possession, and possession is a tendency towards identity or union, which is perfect contemplation. Contemplation is the end of action. The more action is attuned to contemplation the less the need of the soul to go out of itself in action (i.e., the greater the quality of action the less the quantity of action<sup>9</sup>) (III.8.5). Contemplation is, both the origin and end of action, for *poiesis* is the application of rational Forms to potential matter, and this is

an activity of contemplation, "for creating is bringing a Form into being, and this is filling all things with contemplation" (III.8.7). Hence, the originaive principle (Form, Logos, contemplation) is for all things the goal, which is to say that the whole life of the universe is philosophy, or, as Sri Aurobindo puts it, "All life is yoga."<sup>10</sup>

What I hope has been clearly brought out in this meditation on Plotinus is that the role of the hypostases for the practical life is not merely that of serving as guide posts for the return journey to the Absolute. They also function as indispensable powers to be used by the contemplative actor in his creative involvement with the world. While Plotinus did not develop this aspect of the spiritual life, Sri Aurobindo made it a central feature of his Integral Yoga. It is this emphasis that prompted him to remark that his yoga begins where all the others end.

According to Sri Aurobindo the Integral Yogi does not merely use the involutionary dimensions as stepping stones to the infinite, but brings the insight and puissance (*cit-sakti*) found there by the elevation of his consciousness to bear on manifest nature in order to further the evolutionary progress not only of himself or even humanity, but of all life and even physical nature itself. The involutionary dimensions, populated by gods, constitute part of the mechanism of grace, which plays a necessary part in facilitating spiritual development. The help that the beings of the involutionary planes can render to the evolving earth consciousness is severely limited, however, by the lack of conscious cooperation with them on the part of humanity. This lack of cooperation and the consequent difficulties we have in manifesting the Divine in the material world constitutes a negative feedback loop that reinforces the *resentment* world views of dualism and materialism.

In Conclusion, if Neoplatonism is to be revived as a viable contemporary philosophy, I believe it needs to develop the neglected aspect of that philosophy outlined in this essay, and Sri Aurobindo's Integral philosophy would serve as an indispensable guide in this endeavor."

## Endnotes

8. This contemplative understanding of action is virtually identical to the concept of *niskama karma*, desireless action, of the *Bhagavad Gita*, and *mutatis mutandis*, to the *wu-wei*, non-action, of Taoism.
9. "Yoga is skill in action." (*Bhagavad Gita* II.50)
10. In a note to his translation of *Ennead* III.8.7, Armstrong observes that "by making *theoria* the end of all perception and action Plotinus abolishes, no doubt consciously and deliberately, Aristotle's distinction between *praktike* and *theoretike episteme*, or *dianoia*...and makes the whole life, not only of man but the universe philosophy in Aristotle's sense." "All Life is Yoga" is the epigram to Sri Aurobindo's book, *The Synthesis of Yoga*.
11. Another lacunae in Plotinus that Aurobindo's thought would help to fill is in the area of spiritual sociology and a philosophy of history. These are consequences of Plotinus's concentration on the static, nontemporal (Shiva) aspect of the Divine and his failure to appreciate the dynamic temporal (Shakti) aspect.

## **The Four Dimensional Philosophy of Indian Thought and Plotinus**

**I. C. Sharma**

At the very outset I would like to define Indian thought as that ethico-metaphysical philosophy, which has its roots in the four Vedas, Rig, Sama, Yajur and Adharva Samhitas which express the four-dimensional essence of the experiences of the sages, engaged in the spiritual search of God, Nature and Man. Further, this very thought has its roots in the Brahmana Granthas which are the explanatory and definitional part of the Vedas: in the Aranyakas, the philosophical experiential conclusions, drawn by the forest dweller practitioners of the four-fold knowledge stated above, and in the Mahavakayas (the universal statements), experienced, expressed and stated in the Upanisadic part of the Vedic tradition. Let it be pointed out that the Vedic tradition the Vedic Truth is called Sruti, the revealed Truth. This truth was attained by the practice and experience of the Ultimate Reality, the groundless Ground of everything that exists, lives and has being; it is again four-dimensional. This ancient most ethico-metaphysical philosophy has the following four divisions:

- 1) The Mantras or hymns;
- 2) The Brahmanas or the explanatory notes;
- 3) The Aranyakas or the books written by the forest wellers;
- 4) The Upanisads or the philosophical conclusions.

The Mantras or hymns are the oldest aspect of the Vedic literature and have been classified into the four major collections stated above, (i) Rig (ii) Sama (iii) Yajur and (iv) Adharva Samhitas. These Samhitas cover a very wide field, ranging from the social problems of marriage, love and gambling to metaphysical theories of creation. But most of the hymns are addressed to gods, who on a close examination turn out to be the names of the various entities or powers of one Supreme God. This Supreme Ruler of the universe, again, is not a person but a central Reality, the Master of the creation that resides in the very core of everything that exists. According

to Plotinus as well, gods are the entities arising from light; and light is equivalent to Brahman.

The Brahmanic literature explains the various rituals and analyses, the various terms used in the hymns. But unfortunately, this literature has been neglected, not only by the Western, but by Indian scholars as well. In fact, Brahmanas are a link between the Vedic hymns and the Upanisadic Philosophy. In the absence of a systematic study of the Brahmanas, the apparent conflict between the ritualistic philosophy of the Vedas and the *Atma Vidya* (the science of self) of the Upanisads, which places knowledge above action can never be resolved.

The four dimensional philosophy of the Vedas and Upanisads, though chronologically prior to the four-dimensional mystic philosophy of Plotinus with the three hypostases of the One, the Nous and World Soul plus the concept of Nature or Matter as an emanation from the World Soul, is not only similar to, but almost identical with the latter. Before explaining the mystic experience and its purpose the union of the individual soul with the One the Supreme Being, the Supreme Abode of Man and Nature it seems necessary to allude briefly to the four dimensional basis and background of metaphysics, ethics, psychology, epistemology and sociology of the Vedic and the Upanisadic philosophy.

The four dimensions of the Vedic tradition stated above, point to the identity of the Vedic and the Upanisadic four-dimensionality with that of Plotinus. The Vedas, the Upanisads and the Bhagavadgita, the three foundational philosophical texts comprising the Indian tradition, agree in accepting the following four fold-nature of the Brahman, the Supreme Being as:

- (1) *Avyaya* Brahman (the Eternal Infinite Ground of all), corresponding to Plotinus' One, and even transcending the One;
- (2) *Aksara* Brahman (the Indestructible Cause), corresponding to Plotinus' Nous;
- (3) *Atmakara* Brahman (the Supreme Self), endowed with the potentiality of creation, preservation and destruction, and hence a Creator, not yet differentiated as subject and object, corresponding to the World Soul of Plotinus; and
- (4) *Visvasrit* Brahman (the Cosmic Manifestation), the extended material world of universes, super galaxies, and individualities, as an emanation and irradiation of just one spark of the Supreme Self, corresponding to the ensouled matter or Nature of Plotinus.

A word of caution in this context seems to be necessary to distinguish between the Plotinian Hypostases and the four-dimensional nature of Brahman, even though both Plotinian philosophy and Indian thought are firmly rooted in the mystic experience, the sole purpose of which is the return of the four-dimensional Self of man to the four dimensional Supreme Self the One. The *Avyaya* Brahman is not to be confused even with the One or with Unity, since It is also beyond One. Even Plotinus agrees with this transcendence of the One in his writings. Thus the One of Plotinus can be regarded as closer to the *Avyaya* Brahman, even though it is not wholly identical with it. The *Avyaya* Brahman is also designated as the *Paraipara Brahman* (the Brahman beyond the beyond). *Aksara Brahman* is the Absolute and Indestructible the unmanifested potential Cause. This very *Aksara* manifests or transforms itself as the *Parama Purusa* (the Supreme Self or the Supreme Person).

Let the comparison given above be misunderstood, a clarification seems necessary. The *Atmakara* is wholly identical neither with the World Soul, nor with the *nous* though it is closer to the *nous* than to the World Soul, because it is the emanation from the *Aksara* Brahman, which is both the One and also the *nous*.

It would help to clarify why the entire gamut of Indian Thought (including Jainism, Buddhism and the materialist Carvaka philosophy) has been comprehended in the Upanisadic philosophy, which expounds the Pancakosa Theory of the Self i.e., the Theory of the *Annamaya Kosa* (the bodily Self), the *Pranamaya Kosa* (the biological Self), the *Manomaya Kosa* (the Mental or Psychological Self), the *Viijnanamaya Kosa* (the intellectual or rational Self), and the *Anandamaya Kosa* (the Spiritual or Blissful Self).

The final *Kosa* or Sheath, the highest stage of the individual self, consists of bliss. It is within the intellectual, mental, biological and physical self and is the subtlest of all. It corresponds to the *Praetapati*, the center of centers and the truth of truths. The realization of the spiritual or blissful Self leads to God-realization, having attained which the aspirant rises above all contradictions and antinomies. The two stages of self-realization, *Moksa* or *Jivanmukti* (liberation while living in the body) and *Videha Mukti* (final liberation or release after physical death), have been recognized by all the schools of Indian Philosophy. Thus the Upanisadic

thought is the very rock and foundation of the metaphysical as well as the ethical concepts of all the systems of Indian philosophy.

The Upanisads also regard man as four-dimensional by combining the causal intellectual ego and the spiritual Self as *Atman*. Society as an organic whole is constituted by *Atman* (Soul as the spiritual organ), *Buddhi*, (the administrative organ, the causal intellect), *Manah* (Mind, the skilled labour organ) and *Sarira* (the physical labour organ), retrospectively designated as the four castes, *Brahmanas* (the spiritual class), *Kshatriyas* (the administrative class), *Vaishyas* (the skilled labour class) and *Shudras*, (the labour class), based entirely on their bent of mind and voluntary adoption of a particular occupation.

The Vedic and Upanisadic Brahman are identical because of this four dimensionality viz., (1) The Ground (2) The Cause (3) The Supreme Self and (4) The Cosmic Form, corresponding to the Plotinian One, Nous, the World Soul and ensouled Matter or Nature.

This parallelism holds good as far as the constitution of man is concerned. According to the Vedas, Upanishads and Bhagavadgita, Man is microcosmic Brahman, whose four-dimensionality is constituted by the sum of *Atman* (Pure Being), *Buddhi* (the Casual Self), *Manah* (creative psyche the mind), and *Sarira* (the physical body with five sense organs and five organs of action). It is noteworthy that in the Vedic tradition, the gradation from *Avyaya* Brahman (the Pure inexhaustible Ground of everything) to *Visvavrit* (the Cosmic form inclusive of the World Soul and Matter), that is from the One to Nature, in Plotinian language, is from the subtle and most fundamental to less subtle and dependent. The Plotinian concept of matter confirms this very gradation:

"That which is taken to be material, is in reality the Soul. It is an extension of Soul down below the normal level of Soul, or better, it is Soul in its lowest possible level of being. Just as all of the level of Soul is an extension of Mind down below in its normal level, so Mind is the One in an extension down below its normal level, or the One in its lowest possible level. Thus Plotinus' Ultimate is transcendent in its level as the One from all determinate being, but it is immanent in it as *Nous*!"

The Upanisads, as stated above, regard *Atman* (the Self or Purusha) as identical with man as miniature Brahman. The gradation in

the case of Brahman from *Avyaya* to *Visvavrit* is from subtle and most fundamental to less subtle and dependent as already stated. In the case of man, called *Adhyatma*, the gradation is from the most subtle to the most gross. Based on this fourfold cosmic metaphysics and human nature, are the fourfold social, ethical, philosophical and mystical systems in the Vedas, Upanisads and Bhagavadgita. Unlike Plato, the social system in the Vedic tradition is not threefold, but fourfold, because of the spiritual, the intellectual, the mental and the physical aspects. The fourfold values parallel to Platonic virtues are *Artha* (economic value) controlled by temperance; *Kama* (love), depending on courage and temperance; *Dharma* (ethical duty), depending on justice and courage; and *Moksha* (spiritual perfection), depending on wisdom. The Upanisads also state the fourfold nature of knowledge, based on the four levels of *Jagrad* (waking consciousness); *Svapna* (dream consciousness); *Susupti* (deep sleep consciousness or unconsciousness); *Turiya* (supra-consciousness, associated with the spiritual self, the causal self, the mental self and the physical self, respectively). The word *Cit* (consciousness) applies both to waking and dream consciousness and the word *Acit* (unconsciousness) as the ground of *Cit* (consciousness), is not to be understood as devoid of consciousness. *Turiya* is beyond the concept of *Cit* and *Acit*. Incidentally, Plotinus's gradation of the stages from the physical to the level of the One, so far as soul's journey back to the One is concerned, seems to be parallel to this hierarchy.

It seems important to mention that the philosophy of the Bhagavadgita propounds four, not three parts, as it is commonly believed. These four paths or methods or Yogas, of attaining enlightenment are: the *Buddhi* Yoga, corresponding to the spiritual aspect of man (the *Buddhi* here may mean *Nous*, which is closer to the One); *Jnana* Yoga corresponding to the intellectual or rational aspect, *Bhakti* Yoga, corresponding to the mental aspect; and *Karma* Yoga, corresponding to the physical nature of Man. It is pertinent to point out that the first six discourses of the Bhagavadgita are devoted to the *Buddhi* Yoga, the seventh and eighth discourses explicate the *Jnana* Yoga, the ninth to the twelfth discourses explain the *Bhakti* Yoga, and the last six discourses expound the *Karma* Yoga. This four dimensional trend of metaphysics, ethics, sociology, and practical spirituality in Indian Thought is undoubtedly based on the mystic experience of the One Ultimate Reality,

as experiential and is not a figment of imagination. The same explanation applies to the Plotinian metaphysics.

The One propounded by Plotinus as the basics of the Intelligence Nous, the World Soul and of Matter, is not a product of mere imagination, but that experientible indestructibility and everlastingness which pervades every being everywhere. It would be appropriate here to compare the notions of Matter and Brahman in both the Hindu tradition and Neoplatonism. The Isopanishad says "All this living and nonliving (existence) is permeated with Isa (God as Supreme Being), hence the way to the Supreme is to enjoy everything with an attitude of non attachment."<sup>2</sup>

According to Plotinus this everlastingness is present in Matter or Nature as well as in the Soul and Nous. While defining Matter Plotinus says "Matter then, makes the greatest contribution to the formation of bodies...so here in the material world, the many forms must be in something which is One...we can see that this is so because in our present experience things that are mixed together come to identity by having matter, and there is no need for any other medium, because each constituent of the mixture comes bringing its own Matter".<sup>3</sup>

The Bhagavadgita very clearly points out that the One's indestructibility is immanent everywhere: "Know that (Being) to be indestructible in which everything is rooted; no one is capable of annihilating it."<sup>4</sup>

Further, the substrate according to the Bhagavadgita is both potential and actual Being and becoming as coexistent ontologically:

*"Nasato Vidyate Bhavo  
Nabhavo Vidyate Satan  
Ubhycrapi Drishto Anlah  
Tunyo Tatva Darshibhili"*

That is:

Non-being cannot exist;  
Nonexistent cannot be;  
The seers have accepted this...ontology.<sup>5</sup>

Amazingly, Plotinus also arrived at this ontological notion of the substrate. He says: "One speaks of potential and actual existence; and one speaks of actuality in the class of existing things. We must consider

therefore what potential and what actual existence is. Is actuality the same as actual existence, and if anything is actuality, is it also actualy existent? or are the two different and is it not necessary for that which is actually existing to be actuality? Further, it is clear that there is potential existence in the World of Things perceived by the senses, we must not speak of potential existence simply; for it is not possible to exist potentially without being potentially anything...It is better and clearer to use "potential existence" in relation to "actual existence" and "potentiality" in relation to "actuality".<sup>6</sup>

It looks as if Plotinus is providing an intellectual explanation of the intuitively discovered nature of the substrate as both being and becoming or being and existence potentiality and actuality. As a matter of fact, his notion of the substrate was an intuitive discovery rather than an intellectual construct.

This very substrate is the receptacle of all. In the words of Plotinus, "What is called 'matter' is said to be some sort...of 'substrate' and 'receptacle' of forms...As for the question whether intelligible matter is eternal...intelligible realities are originated in so far as they have beginning, but unoriginated because they have not a beginning in time; they always proceed from something else, not as always coming into being like the universe, but always existing, like the universe There."<sup>7</sup>

Thus Plotinus points out that all the individual ties arise from the unmanifested substrate and that this substrate is the matrix of all the experiences of the senses and of the mind. The Bhagavadgita calls this nature the 'lower' nature or *apara prakrti*...So far as the substrate of the individuality is concerned, this nature is called *Avyakta* or unmanifested material ground known as *Pradhan* in Sankhya system and *Avyakta* in the Bhagavadgita: "*Avyaktat vyaktayah sarvah prabhavanti*." That is, all the individualities arise out of the unmanifested substrate.<sup>8</sup>

As lower nature or *apara prakrti*, this substrate has been beautifully expressed in the Bhagavadgita:

*"Bhumiraponalo vayuh kham mano  
Buddhirevaca ahamkara itivam me  
Bhinna prakrurasiadha"*<sup>9</sup>

That is, earth, water, fire, air, space (ether) mind, intelligence and ego are the eight different types of Nature. It is further stated that these are the lower nature which are dependent upon and rooted in One Supreme

Brahman. The point to be noted here is that the immanence of the One Ultimate Being in all the levels of existence from Matter to Nous and vice versa in the case of Plotinian philosophy and from the Avyaya to Vishvasrit and vice versa in the case of Indian Thought, has been propounded solely on the basis of immediate intuitive and mystical experience. This fact must be highlighted in the context of comparative study of Plotinus and Indian Thought especially because Plotinianism is an unique expression of Plotinus' Four-dimensional Philosophy. Any imposition of other influences on Plotinus would be out of place.

It is claimed that Plotinus's teachings were the culmination of ancient Greek and Roman philosophy, since Plotinus followed chronologically Plato and his successors. But this culmination was not a mere summary of what the previous writers had stated. It may be granted that Plotinus' ideas derived their inspiration from Plato, whose philosophy he thoroughly studied. The greatness of his teaching, however, does not depend on his study of Plato nor on the observations of contemporary Christian traditions. Plotinus's philosophy was primarily the outcome of his personal inner experience and his spiritual development. His own intuitive experience, his meditation and the glimpses of the divine light, led him to his fundamental convictions, concluding that God is the source of all existence.

Plotinus's cosmology reveals the presence of individual differences and plurality of souls in the spatio-temporal world, emanating from one God, who is Himself infinite and undifferentiated. This One is also the Supreme God, identified with the light above light. Beyond this however, he tried to avoid the use of any positive concept to define God, lest it conceptually limit Him. Human soul individuates from the World Soul, which itself is an emanation from the infinite God. Before being incarnated, the soul was in a state of constant contemplation of the eternal Nous (Mind), and had complete knowledge of the good. Having separated from God and descended into the material world, it is now on its journey back to God and passes through various births in its ascent towards its Supreme Source. In the state of ecstasy, the soul is raised above all limitations and merges with the soul of God. Only thus reunited with its source can the soul retain true knowledge. These ideas cannot be labelled as the mere summary of a theoretical study of Plato or Aristotle on the part of Plotinus. Rather, they are the expression of intuitive inner experiences

arising from the link of the individual consciousness with the cosmic current.

When the intuition is honoured, and when the inner experience corroborates the external observation, the diversity is understood in its right perspective. Differences and duality are not abolished, but an insight into the underlying unity weaves a coherent and consistent pattern into the differences. Truth is then established as an organic whole of various interrelated parts, which are neither mutually exclusive nor absolutely independent. Reality is fundamentally One and essentially eternal.

## Plotinus' Criticism of Materialism

Christos Evangelou

## I

In *Vita Plotini*, Porphyry provides us with valuable information about Plotinus' habits as a teacher and a writer.<sup>1</sup> From Porphyry's sympathetic presentation, Plotinus emerges as an inspired and inspiring teacher who, like Pythagoras, Socrates, Ammonius Sakkas, and other philosophers before him, was reluctant to commit his thoughts to writing.<sup>2</sup> Late in life, he was persuaded by his students to write down and circulate his advanced doctrines among the selective members of a small inner circle.<sup>3</sup> When they do not express his mystical experiences in metaphorical language, Plotinus' writings reflect the conversational style of the school discussions which would review the opinions of various Hellenic philosophers of the past on a given subject, and invariably end up in presenting the Platonic position as understood by Plotinus. Only two of the fifty-four treatises are engaged in polemics, *Enneads* II.9 and VI.1, and in both cases Plotinus assumed the role of the defender of Plato and genuine Platonism of the Old Academy. The former of the polemical treatises attacks the Gnostics for their misunderstanding of Platonic texts, while the latter criticizes both Aristotle and the Stoics for their audacity to propose radically new sets of categories as a substitute for the Platonic "genera of being".<sup>4</sup> Elsewhere I have analyzed the arguments and explained the reasons for which Plotinus found it necessary to criticize the Gnostics and to reject the Aristotelian doctrine of categories.<sup>5</sup> At the present I would like to consider the specific objections which Plotinus raised against what he considered as a Stoic set of categories in *Ennead* VI.1 which has not received much attention compared with his criticism of the Aristotelian set.<sup>6</sup>

These two sets of categories are functionally comparable in that each of them attempts to provide an ontologically adequate account of the sensible world, but they are equally unacceptable to Plotinus who, being convinced of its truth, wanted to revive the ontology of ancient Platonism with its emphasis on immaterial, incorporeal, and intelligible beings. It will become clear from our discussion that the debate had to do less with

logic and more with ontology which at the middle of the third century A.D. was about to take another turn away from the prevailing materialism. The time was ripe for the rebirth of Platonism of the Old Academy and Plotinus was ready to fight all opposition to such a revival. But before we come to consider Plotinus' specific objections to Stoic monistic and materialistic conception of the Cosmos, it would be helpful to place our discussion in its appropriate context.

## II

*Ennead* VI.1.1 opens with a paragraph in which Plotinus looks back at the history of Greek philosophy and sums up the opinions held by various philosophers regarding the number and nature of beings: "Some said there was one being, some a definite number, and some an infinite number; and in each of these groups, some said the one being was one thing and some another, and the same applies to those who said the number of beings was limited and those who said that it was infinite." Plotinus asserts that the relative merits of each of these positions had already been considered by others who rejected, with good reasons, the two extreme views which claimed that being is one or infinite in number. The consensus was that the number of categorically generic beings is limited and definite, but there was disagreement as to their correct number between the most important schools, the Peripatetic, the Stoic, and the Platonic, which had respectively declared for a tenfold, a fourfold, and a fivefold division of reality. Hence the problem. In his effort to solve this ontological problem and to prove that the Platonic division is philosophically sounder than either of the alternative divisions, Plotinus had to display great dialectical dexterity and a pugnacious spirit which are not typical of him.<sup>8</sup>

Plotinus' strategy develops in three phases. In *Ennead* VI.1. he criticizes both the Aristotelian tenfold and the Stoic fourfold divisions of beings or rather sets of categories<sup>9</sup> for many reasons but basically because neither of them seems to pay sufficient attention to the intelligible and immaterial realm which has, for the Platonists, the most important beings; in *Ennead* VI.2 he expounds and defends the Platonic fivefold division of beings as found in the *Sophist* 254c-255d, *to on*, *tauton*, *heteron*, *kinesis*, and *stasis*, because it articulates clearly the ontological relations of the intelligible beings; and in *Ennead* VI.3 he returns to consider the sensible realm of becoming for which he attempts to provide a new set of five

categories which differ from the Aristotelian categories.<sup>10</sup> This fact in conjunction with the fact that only six of the thirty chapters of *Enneads* VI.1 are devoted to criticizing the Stoic division of categories indicates that, for Plotinus, the real threat to the revival of Platonism was not the crude monistic materialism of the decaying Stoa, but the more subtle and sophisticated Peripatetic ontology which gave priority to sensible substances over the pure Platonic Forms.<sup>11</sup>

It is true that such Stoic doctrines as the unity and sympathy of the sensible cosmos, the function of *logos* and of providence in ordering and guiding all nature and the ideal of the wise man who practices *arete* and finds happiness in this life, did influence the thought of Plotinus. Some of these doctrines as well as many Aristotelian doctrines did find their way into the *Enneads* so that Porphyry is justified in stating "His (Plotinus') writings are full of concealed Stoic and Peripatetic doctrines. Aristotle's *Metaphysics*, in particular, is concentrated in them."<sup>12</sup> However, since the categorical doctrine is not among those Stoic doctrines which influenced Plotinus' philosophy, it would seem that he had serious ontological objections against it.

## III

According to *Ennead* VI.25, 1-6, the Stoics distinguish four genera or categories of beings which he identifies as follows: substrates, substances or "subjects" (*ὑποκείμενα*) qualia or qualified things (*ποιὰ*); disposed things or "things in a certain state" (*πρὸς ἑχόντα*); and relatively disposed things or "things in a certain state in relation to others" (*πρὸς τι πρὸς ἑχόντα*).<sup>13</sup> Plotinus also claims that these genera are subsumed under a super genus, "the something" (*τὶ*) which is supposed to encompass both the corporeal, existent, and real things of the sensible world, as well as the incorporals; void, time, place, and the famous *λεκτά*.<sup>14</sup> This supposed super genus became the target of his first attack:

For, really, how incomprehensible and irrational this something of theirs is, and how unadapted to bodiless things and bodies. And they have not left any room for differences with which they will be able to differentiate the something. And this something is either existent or non-existent; if then, it is existent, it is one of its species; but if it is non-existent, the existent ■ non-existent. And there are innumerable other objections.

Well, we should leave those for the present and consider the division itself (VI.1-23, 6-12).<sup>15</sup>

In order to appreciate Plotinus' arguments against the stoic division of reality, we must keep in mind the basic tenets of their philosophy of nature.<sup>16</sup> For the Stoics the real world is one, living, finite, and corporeal being located in the infinitely expanded void, "like the seed in the womb."<sup>17</sup> It is permeated by the divine and vital *πνεῦμα* which is also material but active and responsible for the differentiations and qualifications of matter which gives rise to elements, living beings, and rational beings, all sympathetically related as parts of an integrated Cosmos.<sup>18</sup> In other words everything real is either matter or qualified matter, but the qualifications of matter are due to influence of *pneuma* which is to be understood as a material like fire-air.<sup>19</sup>

With this picture of the Stoic conception of the world in mind, it will be easy to understand the reason for which Plotinus concentrates the fire of his criticism on the first two genera: the *ὑποκείμενα* identified with material bodies and ultimately with matter; and the *τιὰ* identified with the qualified material bodies; while he is rather brief in his treatment of the other two categories, "the things in a certain state" and "the relatives". For instance, he is aware that the Stoics try to distinguish between "the certain state", as it applies to matter which produces the qualia, and as it applies to qualia which produces specifically what they call "things in a certain state." But, Plotinus objects, since the qualia themselves are nothing but "matter in a certain state", it would follow that "the things in a certain state" are ultimately related to matter. Besides, even if the positing of the third category is accepted as legitimate, Plotinus finds totally unacceptable its claim to substitute for such diverse Aristotelian categories as quantity, quality, place, time action, passion, position and possession, although in *Ennead* VI.3 he did not admit most of these categories into the fivefold list which he accepted as final.<sup>20</sup> He concludes with a remark about the fourth category:

But as regards the relative, if they did not class it under one genus with the other (things in a certain state) it would take another discussion to enquire if they give any reality to such (relative) states, since they often do not do so. And again it is absurd to put a thing which is subsequent to things already existing into the same genus as the things which were there

before: for one and two must be there first for there to be half and double." (VI.1 30, 24-28)

Plotinus' brief comment on the fourth category of relation and the relative contrasts with its importance for Ancient and Modern Skepticism and the enthusiastic treatment which it has received.<sup>21</sup>

However, about the other two categories especially the first one, Plotinus has something more interesting to say. Utilizing dialectically the Aristotelian distinctions between genera and species, prior and posterior, potentiality and actuality, substance and accidents, and matter and form, Plotinus is able to look critically at the Stoic category of *ὑποκείμενα*.<sup>22</sup> To summarize and paraphrase his argument (VI.1 25-27), it seems to Plotinus that the Stoics are mistaken in giving priority to matter by considering it as a first principle and at the same time as a genus of being to be classified with material bodies to which it gives rise, thus mixing carelessly what, in their account, is prior to that which is posterior. Furthermore, they speak of *hypokeimena* in plural, while the singular would be more appropriate, since their conception of matter is one continuous and indivisible mass.<sup>23</sup> It is also absurd to give priority to matter which is potentiality, instead of giving it to actuality, that is, the forms, the *rationes seminales* or the divine λόγος.

The absurdities seem to multiply for the Stoics who identified matter with body which itself is a composite of matter and some form or other unless. Plotinus remarks, they use the word "body" with a new meaning different from the common one which associates natural bodies with three-dimensionality and resistance.<sup>24</sup> Above all, by giving ontological priority and the place of honor to that which is indefinite, obscure, shapeless, lifeless, and mindless, that is, sheer matter, the Stoics reduce everything else including God to "matter in a certain state."

To Plotinus it does not make sense to hold, as the Stoics do, that substantiality is decreasing as one moves from matter to body, from bodies to living beings, and from living beings to rational beings because it is contrary to intelligible reality and its priority as he understands it. He describes as follows the root of the Stoic absurdities and the gulf which separates theirs and the Plotinian approach to reality and to the really real beings:

The cause of this is that sense-perception became their guide and they trusted it for the placing of principles and the rest. For they considered

that bodies were the real beings, and, since they were afraid of their transformation into each other, they thought that what persisted under them was reality, as if someone thought that place does not perish. Yet place also does persist for them, but they ought not to have considered that what persists in any kind of way was real being, but to see first what characteristics must belong to what is truly real, on the existence of which persistence for ever depends... But the most extraordinary of all is that, though they are assure of the existence of each and every thing by sense-perception, they posit as real being what cannot be apprehended by sense, for they do not rightly attribute resistance to it; resistance is a quality. But if they say they grasp it by intellect, it is an odd sort of intellect which ranks matter before itself and attributes real being to matter but not to itself. So, since their intellect is not real for them, how could it be trustworthy when it speaks about things more authentic than itself and is in no way related to them? (VI-1, 28, 5-26)

Regarding the second category, the qualia or qualified things, Plotinus proceeds in a similar manner. He raises a series of questions about the nature of the qualia and how they differ from the substrates in order to make the point that Stoic materialism has turned the world really upside down. To paraphrase his argument again, it runs as follows: Since the Stoics posit qualia as a second category, it must be different from their first category, the substratum which was shown to be material, passive and composite. Therefore, the second category must be simple, active and incorporeal. But that is not what the Stoics assert, when they talk about *ἐνὸλοι λόγοι* and characterize their second category as qualified matter and qualified substrata. If their *λόγοι* are nothing but "matter in a certain state," this would make the second category indistinguishable from the third. Plotinus' opponents must face the dilemma that either the *λόγοι* are real beings before they unite with matter in order to produce the qualified things, in which case they will have to give up their materialism; or the *λόγοι* are not real, in which case they must abandon their division of the categories because all of them are reducible to "matter in a certain state." But, Plotinus asks poignantly:

Who then, asserts this? Not, presumably, matter. But perhaps matter does assert it: for matter in a certain state is intellect; though the "in a certain state" is a meaningless addition. Matter, then, says this and understands it. And if talked sense, it would be surprising how it thinks and does the works of the soul, when it has neither intellect nor soul...But, as things

are, matter does not speak, but the speaker speaks with a large contribution from matter, to which he entirely belongs; even if he has a bit of soul, he speaks in ignorance of himself and of the power which is able to speak the truth about such things. (VII. 29f 27-36)

The irony with which Plotinus speaks in this passage highlights the gap which separates the philosophy of Platonic idealism which he wanted to revive from the decaying philosophy of stoic materialism.

#### IV

From the above observations and comments it follows that Plotinus did not treat the Stoic set of categories with much care nor did he approach it in the same serious manner as he did the Aristotelian set. The reason for this differential treatment perhaps has to do with two related factors which are: first, his adherence to the ontological interpretation of the categories, as opposed to the logical and the grammatical interpretations which were adopted by other Platonists;<sup>25</sup> and, second, his commitment to revive the philosophy of Plato which, in his interpretation, gave priority to the incorporeal and the intelligible being, while it gave to the sensible and corporeal cosmos a status of dependence. This commitment placed Plotinus in polar opposition to Stoic corporealism and materialism which he considered as unworthy of serious attention by any philosopher with some sense of self respect as an intelligent human being, a being capable of seeing reality as it really is by using not only discursive reason and also intuitive *noûs*.

Accordingly, believing that the Stoics were trying to conceal the sheer materialism of their philosophical system by drawing divisions upon divisions of beings within the same materialistic framework, Plotinus was unprepared to study the Stoic doctrine of the categories in the scholarly and dispassionate manner which his student Porphyry, for example, and Simplicius later, displayed in their numerous commentaries on Aristotle's works. Unlike these commentators, Plotinus shows no interest and makes no effort to understand the Stoic position correctly, let alone sympathetically. For him nothing ontologically sound could come from a philosophy which put the feet in the place of the head, unless and until the system were to be turned around or rather literally up-side down.

Evidently Plotinus was able to do to Stoicism what Marx did to Hegelianism in modern times but in the reverse order. This clearly

indicates that the long battle between materialism and idealism is by no means over. However, the signs of our troubled times seem to favor the revival of the Plotinian version of Platonism whose categories and ontological priorities are destined to remain, as they have always been, opposed to materialism in all its shapes, Stoic or Epicurean, Marxist or Maoist, Ancient or Modern. More than any possible historical connections between the two, what makes Plotinus a permanent ally of the Indian genus is his determined opposition to materialism and his successful effort to revive the Platonism of the Old Academy with its emphasis on things immaterial, such as the Soul, the Intellect, and the one Absolute.

In conclusion, it would seem that Plotinian philosophy and Indian wisdom are destined to work together in assisting the human mind to comprehend the cosmos, to find its appropriate place in it, and to give meaning to its existence by seeing that the true, the good, and the beautiful all stem from the same ineffable Source. By the strength of their common wisdom, tolerance and enlightenment, Plotinian Platonism and Indian Spirituality can help post-modern humanity overcome anxious existentialism, atheistic materialism, and monotheistic fanaticism in any form of intolerant dogmatism.

## Endnotes

1. See *Vita Plotini in Plotinus*, 7 vols., ed. and translated by A. H. Armstrong, Cambridge Mass.: Harvard University Press, 1978-1986. Unless stated otherwise all quotations will be from this edition.
2. The art of writing should be considered as distinct from the art of dialectic and the art of speaking. For one can be a great teacher, like Socrates and Ammonius, or a great thinker, like Heraclitus and Heidegger, without being a great stylist. In this sense, Plato was exceptional.
3. Porphyry was the most trusted of his students and accepted the responsibility of ordering and editing the treatises after the teacher's death, which became known as the *Enneads*.
4. In fact, the title of the three related treatises *Ennead* VI. 1, 2 and 3, is "On the Genera of Being."
5. See my *Aristotle's Categories and Porphyry*, Leiden: J. E. Brill, 1988, 2<sup>nd</sup> ed., 1994, especially part Two; and "Plotinus' Anti-Gnostic Polemic and Porphyry's *Against the Christians*" in *Neoplatonism and Gnosticism*, Richard Wallis and Jay Bregman, SUNY Press, 1988.
6. The general perception that the Stoic categories, unlike the Aristotelian categories, played no significant role in the development of Stoic logic might explain the lack of interest. On this see B. Mates, *Stoic Logic* (Berkeley, 1953), p. 18; and I. M. Bochenski, *Ancient Formal Logic* (N. Holland, 1951), p. 87.
7. Although Plotinus does not identify which view was held by whom of the Pre-Socratics, it is not difficult to guess, since he seems to follow the pattern used in the first book of Aristotle's *Metaphysics*. See also Armstrong's footnote information on this in his *Plotinus*, Vol. 1, p. 12.
8. Other scholars have noticed that this part of the *Enneads* is difficult and taxing reading. E.g. W. R. Inge, *The Philosophy of Plotinus* (New York, 1923) p. 194. Part of the difficulty relates to the fact that in his criticism of the Stoics and the Peripatetics Plotinus presupposes many commentaries which, although are not extant for us, were available and read in his school as a basis for the discussions to follow, as Porphyry informs us *Vita Plotini* 14.
9. Since he intends to apply the term *genos* to the intelligible realm of being which is more unified than the sensible realm of becoming, Plotinus prefers to refer to the Aristotelian and the Stoic divisions as *kategoriai*. For more on this important distinction I refer to my book, *op. cit.*, pp. 93-99.
10. "The Plotinian Reduction of Aristotle's Categories," in *Ancient Philosophy*, 7 (1988) 146-162.

11. Beginning with Porphyry, Plotinus' followers tried hard to reconcile Platonism and Aristotelianism by rehabilitating the doctrine of categories, as I have shown in my book *Aristotle's Categories and Porphyry*.

12. *Vita Plotini* 14.

13. The same names of the fourfold division is mentioned by Simplicius in *Aristotelis Categoriae commentarium*, ed. C. Kalbfleisch (Berlin, 1907), pp. 66-67. Modern discussions on the subject include: M. Pohlenz, *Die Stoa* (Goettingen, 1948-49), vol. 1, pp. 69-70 and vol. 2, pp. 39-42; P. De Lacy, "The Stoic Categories as Methodological Principles," *TAPA*, 76 (1945): 246-263; J. M. Rist, *Stoic Philosophy* (Cambridge, 1969), pp. 152-172; S. Sambursky, *Physics of the Stoics* (New York, 1959), pp. 17-20; A. A. Long, *Hellenistic Philosophy* (London, 1974), pp. 160-163; A. Graeser, *Plotinus and the Stoics* (Leiden, 1972), Chapter Four; M. E. Reesor, "The Stoic Categories," *American Journal of Philosophy* 78 (1957): 63-82; and G. Reale, *The Systems of the Hellenistic Age*, tr. J. R. Catan, (New York, 1985) pp. 226-229. For the fragments see H. von Arnim, *Stoicorum veterum fragmenta* (Berlin, 1905).

14. In SVF II, 501; also II, 333, the scholion from an anonymous commentary reads as follows: τρία δὲ τὰ καθολικώτατα ὁμώνυμα. ἐν. ὅν. τί. Κατὰ πάντων γὰρ τῶν ὄντων φέρεται ταῦτα, κατὰ μὲν Ἠλλάων τὸ ἐν, κατὰ Ἀριστοτέλη τὸ ὄν, κατὰ δὲ τοὺς Στωϊκοὺς τὸ τί.

15. It would seem that Plotinus utilizes here Aristotle's argument against those who posit being (τὸ ὄν) as a genus capable of synonymous predication: οὐχ οἷον τε δὲ τῶν ὄντων ἐν εἶναι γένος οὔτε τὸ ἐν οὔτε τὸ ὄν, *Metaphysics* 998b 22, also 1003b 23-24, 1017a 22-27, 1028a 10-b 7.

16. Plotinus' ontological approach to Stoic categories is closer to Sambursky's than to De Lacy's interpretations in the works cited in note No. 13. The former has tried to analyze the Stoic physics and the latter the Stoic ethics in terms of their doctrine of categories with some success.

17. SVF I, 37a, Stobaeus uses this beautiful metaphor to indicate the place of the divine λόγος in matter, but it could be applied to the whole world nested in the infinite abyss of void.

18. For more details on the stoic cosmology, see Sambursky, Long, Pohlenz, and Reale as cited in note No. 13.

19. SVF II, 359; II, 399-401; and II, 449.

20. On this see my "The Plotinian Reduction of Aristotle's Categories," *Ancient Philosophy* 7 (1988) 146-162.

21. E. G. Long, *op. cit.*, p. 163, writes "For this reason the fourth of the Stoic categories has the widest and most interesting implications. Where all things are interdependent, an idea which has today taken on a particular ecological significance, the concept of relationships is a fundamental one." See also Sambursky, *op. cit.*, p. 18-20.

22. It seems to me that Professor Reesor, *op. cit.*, is inordinately critical of Plotinus because of his use of non-Stoic criteria in his criticism of the Stoic doctrine of categories.

23. Ὀγκος is the word used here by Plotinus which gives the impression that, in his mind, the Stoic emphasis on matter and bodies seemed to reduce Platonic ontology to tumorous oncology.

24. Plotinus was perhaps irritated that the old Platonic definition of real being, "that which has the power of acting and being acted upon," *Sophist* 248c, was appropriated by the Stoics and applied to material bodies. On the Stoic conception of body, see also Sambursky, *op. cit.*, pp. 29-44; Long, *op. cit.*, pp. 152-158; and Reale, *op. cit.*, pp. 237-259.

25. I have dealt with this problem in "Alternative Ancient Interpretations of Aristotle's Categories." In *Language and Reality*, ed. K. Boudouris (Athens, 1985), pp. 163-173.

## Plotinus and Vedanta

S. R. Bhatt

Every system of thought is basically a product of the felt needs and aspirations of its age and of the sociocultural milieu. In its rise it may envelop its past and may also gather influences from its surroundings. There is nothing wrong or unnatural about it. It is in this background one should view the striking similarity in fundamental ideas between Plotinus and Vedanta. The doctrinal affinity in respect of the Vedic and the Vedantic 'Tadekam' and the 'One' of Plotinus is remarkable and attracts comparative studies. The half century old controversy as to whether Plotinus was influenced or not by Indian thought and whether Plotinus is himself Vedantic seems not very worthwhile.

In their metaphysical reflections both Plotinus and Vedantic thinkers regard the One negatively as unknown and undefined and positively as unity of Being, Thought and Bliss (*Sat*, *Cit*, and *Ananda*). Both ascribe *freedom* (*svarat*) and *volition* (*Kama*) to the One. Both insist that the One is immanent and transcendent in many.

This reference to doctrinal affinities, however, should not lead one to overlook the fact that the setting and the conceptual framework within which these two philosophies operate are different from each other and therefore any far fetched interpretation has to be avoided in the zeal to point out their similarity.

Plotinus and Vedantic thinkers highlight the need for metaphysics. Every thinking person sooner or later asks himself the questions, "Who am I?" "Why am I here?" "How did I get here?" "What is my future?" etc. These questions inevitably give rise to other questions about the nature of existence of both self and the world. Both Plotinus and Vedantic thinkers held the deep conviction that, as Plotinus put it, "We have undoubtedly to believe that the truth has been discovered by some of the ancient and blessed philosophers." But he cautions us by adding that, "It is advisable to see who were those who found it and how we can ourselves reach it." (*Enneads* III.6.1.13-16). In the Nasadiya Sukta of the Rgveda the seer poses a query about the supreme truth as follows: "Who knows it directly?

Who would answer the questions: Out of what sort of cause has it originated? From where did this creation take place? The gods themselves came into this existence after this creation has taken place. Who can therefore say as to wherefrom all this originated? That out of which this origination took place, did it undertake this creation or did it not also not do so? Only its Lord who resides in the Supreme heavens knows that; or maybe He too does not."

But soon the Vedic seer recovers faith in the ultimate existence of one Supreme Being (*Sat*) which is all-pervasive (*Brahman*) and which is the essence of all (*Atman*).

In India, philosophy was always a faith by which people lived. Even when it was a critique of faith and questioned the old faith, it always created and substituted a new faith. Buddhism is an instance of this tendency. Faith alone leads to certainty and experience. Faith anticipates that we will reach the truth embodied and presupposed in the act of faith. This is what the Gita teaches, "The faith of each is in accordance with his nature, O Bharata, man is made of his faith, as a man's faith is, so is he." (XVII 7.3). The Chhandogya Upanishad declares, "When one has faith then one reflects, without faith one does not reflect. One reflects only when one has faith" (CL7.19). Plotinus also holds, "Thus we arrived at a proof. But are we convinced? A proof entails necessity but not conviction. Necessity resides in the intellect and conviction in the soul." (*Enneads* V.3.6.8.10; VI.1.4.32)

Faith, thus, must precede all ultimate knowledge (*paravidya*) which is a spiritual experience. Faith has to guide it, serve it as its criterion. But it is not a blind or irrational faith. It is a faith which is compatible with reason and which is grounded in spiritual experience and which seeks its culmination in that experience. Plotinus writes, "With my reason I find God. After I have found him I have not the same need for my reason as previously. God can be found by means of the laws of logic but these laws cannot analyze him. The power and indispensability of logic are freely granted; but in the case of simplex it is powerless; because its function is to analyze and a simplex is incapable of analysis. After I have reached the simplex by the power of my reason I contemplate that simplex because there is nothing else left for me to do." This is exactly what the Katha Upanishad says, "*Drsyate tvagryaya buddhya suksmaya*" (I.3) or, "*nayamatma pravacanena labhyo na medhaya na bahuna srutena*" (I.2)

There is such a striking similarity as if Plotinus were actually translating the Katha Upanishad.

In the primacy of experience reason, faith and scriptures all become mutually corroborative and supportive. But this experience is not applicable to sense experience which is incurably subjective, finite and ineffective, since it is based on exclusive attention to a few isolated brute facts with a total neglect of multifacetedness and unitive nature of things. *Paravidya* is not accumulation of more information but entering into new dimensions of reality; a unitive or integral experience which transforms the entire being, changes one's whole life and attitude. Professor K. S. Murty refers to it as commotion producing power (*The Indian Spirit*, p-134). Plotinus says that 'true knowledge' is the immediate intuition of the unity of beings. "In participating in true knowledge we are real beings; we are all together real beings and constitute but one being." Thus according to Plotinus the universal being is that in whose bosom every difference is absorbed, in which every distinction between subject and object comes to a complete end. Such an identity of self with universal being is not a rational conclusion reached by the discursive intellect but a special intuition arising from contemplation. It is not knowledge in the usual sense of the term since it is knowledge concerning the very subject of knowledge and the act of knowledge. It is the very presupposition in all knowledge (*Tasya bhasa sarvamidam vibhati*). As the Upanishads say, How can it (discursive intellect) know him through whom it knows everything? How can it know that which knows? You can not see that which sees in seeing, nor learn that which learns in learning, nor understand that which understands in understanding. There is no other outside of it to see, to understand and to know; "whoever does not know it knows it. Unknown by him who knows it is known by him who does not know".

In conclusion, it must be pointed out that this is not a metaphysics which is created in a library or in an armchair; but developed in the laboratory of real life situation with all concreteness. It is not an empty or barren speculation which could be in the west under the onslaught of logical positivism. It is not an abstract intellectual play with isolated and brute facts but an illumination of them in their inter-relatedness and interdependence. It is a way of life based on an integral view of life. It is a theory of action based on practical wisdom acquired through reflection on concrete experience, whether that experience pertains to a battlefield as in

the Gita or to the court of a king as in Brihadaranyakopanishad; or to the hermitage of a seer as in Chhandogya Upanishad or to the laboratory of a practicing scientist as in the Vaisesika thinkers experimenting on matter and motion; or to Caraka experimenting on vegetation. It is a darshana, a Weltanschauung, a way of life wherein one finds unity, peace, perfection and plenitude.

## Plotinus and Sankara Some Significant Affinities and Divergences

G. C. Nayak

Plotinus and Sankara, two thinkers from the ancient past, have in recent times often been dismissed too lightly by modern philosophers.

Neoplatonism has fallen into disrepute even in the West. It has been accused of not being faithful to Plato, of not being philosophy at all, and so on. Vedanta, especially Sankara's Advaita Vedanta, has been charged by some contemporary scholars, of propagating and promoting illusionism and destroying our normal outlook on life as a whole.

Some Western scholars, like P. R. Coleman-Norton for example, dismiss Neoplatonism as poetry rather than rational philosophy. "This is poetry, not philosophy, when rapture is exalted over reason, and in this essential process of Neoplatonism ancient philosophy abdicates".<sup>1</sup>

As for Indian philosophy, a band of self-appointed custodians of philosophy customarily dismiss the whole of Indian philosophy as mere mysticism, poetry, primitive thinking and so on.

It is in this context that we seek to revive the thoughts of these two great ancient thinkers. The question of their very relevance in the present-day world dominated by science and technology has first to be settled. Unless some relevance to current concerns can be established, there is little point in discussing or examining the substance of their thinking.

One must, however, ask the question: What is the ground of the claim of science and technology to pose as the final arbiter of relevance? Why should everything be tested on the anvil of science and technology? Even if we concede some dominant role to science and technology in determining relevance, that role cannot be all pervasive. For example, science and technology cannot dictate to us in such a way that no one is allowed to cherish classical music, or classical art and poetry.

Contemporary relevance or the absence of it cannot be predetermined, before one has some grasp of the content of the thought of these ancient masters. Contemporary relevance, to my mind, cannot be affirmed simply on the grounds, for example, that present day scientific findings are found to be in conformity with the Vedantic Wisdom of the

past. This in itself, even if it were the case, cannot prove anything. Neither Vedanta nor Science, to my mind would gain a sort of invincibility or sacrosanctity simply because they may perhaps seem to corroborate each other in and through some surface resemblance of theirs when differences are lost sight of. Science, after all, is ephemeral, and prone to change. It is, to say the least, falsifiable, in the words of Popper.

There is nothing like final or ultimate knowledge, Wisdom or explanation in science, nor is it a fact that there is a single unitary principle available in science as a key principle for the solutions of all possible problems. The scientist can dream of a time in future where such an explanation can be found, and this is nothing but a fond hope, I should say, on the part of a scientist with an inbuilt inveterate optimism. Hawking, one of the greatest cosmologists of the present day, thus gives us the hope that, "if we do discover a complete theory (of Physics), it should, in time, be understandable in broad principles by everyone, not just a few scientists. Then we shall all, philosophers, scientists and just ordinary people, be able to take part in the discussion of why it is that we and the universe exist. If we find an answer to that, it would be the ultimate triumph of human reason—for then we would truly know the mind of God".<sup>2</sup>

Even this hypothetical situation is controverted by scientists like Davis who think that "rational explanation for the world in the sense of a close and complex system of logical truths is almost certainly impossible. We are barred from ultimate knowledge, from ultimate explanation, by the very rules of reasoning that prompt us to seek such an explanation in the first place".<sup>3</sup> If this is what science is, what corroboration for ultimate principles in metaphysics, whether it is Neoplatonism or Advaita Vedanta, can be expected from the results of scientific pursuits? Perhaps we take to the wrong direction when we turn to science for either corroboration or criticism of a metaphysical theory. Neither Neoplatonism nor Vedanta can take pride simply because it is somewhat in a vague sense corroborated by the direction taken by present-day science. I am therefore, of the opinion that we have to seek criteria for their relevance, if any, elsewhere.

Moreover, there is one peculiarity about philosophy which needs to be noted *vis à vis* science. Scientific techniques, methodologies and findings may get outdated or outmoded, but this does not happen in philosophy, at least not in the way it happens in science. Philosophers and their philosophies, especially those who really count, seem to have a tendency to persist, even if they at times are undermined or shown to be of

greater relevance at a particular time. Both Neoplatonism and Vedanta have persisted in spite of their summary rejection, so to say, at the hands of some self-appointed custodians of philosophy, whether in the West or even in India itself.

As I understand the situation in philosophy, what survives in any philosophy worthy of its name, in spite of attacks from different angles and from various sources, is its adventure, so to say, in the world of thought, the conceptual shock or jerk and the intellectual commotion or upheaval effected by such an adventure. What survives is the novel way of looking at things, a direction given which may not be of any immediate utility but which may simply be the guiding spirit for in-depth researches to be carried on in future.

A pioneer shows the way in an experience hitherto unnoticed, engineers a value-shift that would bring about a fundamental change in our ordinary day-to-day outlook, life and experience; provides an insight or a coordinating thought that incessantly beckons us to take a dive into its immeasurable depth. All these and similar other factors in a genuine philosophical enterprise are those that survive against all odds, and even seem to have a tenacity that lasts for centuries. These factors are either neglected as simply useless or are welcomed as extremely relevant only because it serves a specific need of the time. Philosophy acquires importance, no doubt, in accordance with its contemporary relevance, but what I want to say is that philosophical enterprise can and should be assessed independently and irrespective of their contemporary relevance alone, for their merit is not merely confined to such utility in the contemporary world. The adventure in the domain of thought is in itself laudable, to say the least.

Shall we say that it is the mystical that has survived in both these thoughts, viz. Neoplatonism and Vedanta, and has been a constant source of attraction and enticement for many as much as it has also been a butt of ridicule by the so-called votaries of reason? Well, it may be so. There are elements in both these thoughts which can be construed as mystical from a certain point of view. And that mystical element continues to entice and excite us throughout the centuries.

But it would be wrong to put everything in Vedanta and Neoplatonism in one basket, under one blanket term viz. mystical. It is not exactly the mystical aspect of these great thinkers which I would like to highlight here, although I do not deny that the mystical in itself has its own

attraction. I would here like to draw the attention of all concerned to that aspect of Plotinus' philosophy where he has highlighted the life and conduct of "a Sage, a Master in Dialectic" as Plotinus calls him. "Once a man is Sage," says Plotinus, "the means of happiness, the way to good, are within, for nothing is good that lies outside him. Anything he desires further than this he seeks as a necessity, and not for himself but for a subordinate, for the body bound to him, to which since it has life he must provide the needs of life; not, however, the needs of the Sage himself, but only of his body. He knows himself to stand above all such things, and what he gives to the lower he so gives as to leave his life undiminished."

This is very significant indeed because it draws our attention to a type of life that is not ordinary in any sense. "A thousand mischances and disappointments may befall him and leave him still in the tranquil possession of the Term", says Plotinus. "The Sage", according to him, "sees things very differently from the average man: neither ordinary experience nor pain and sorrows whether touching himself or others, pierce to the inner hold. To allow them any such passage would be a weakness in our soul". It is important to note that, according to Plotinus, "pleasure and health and ease of life will not mean any increase of happiness to him nor will their contraries destroy or lessen it. When in one subject, a positive can add nothing, how can the negative take away?" The Sage is "ever cheerful, in order of his life ever untroubled, his state is fixedly happy and nothing whatever of all that is known as evil can set it awry—given only that he is and remains a Sage." What is noteworthy about him is that he "can never be deprived of his vision of the All-good."

"For man and especially the Sage", says Plotinus, "is not the complement of soul and body: the proof is that man can be disengaged from the body and disdain its nominal goods". The Sage thus "can be fearless through and through. Where there is dread there is not perfect virtue, the man is some sort of a half-thing." Although it is true that the Sage "will give to the body all that he sees to be useful and possible", at the same time it is to be noted that "he himself remains a member of another order." Referring to Plato in this connection, Plotinus points out in unmistakable terms what Plato rightly taught, that he who is to be wise and to possess happiness draws his good from the Supreme, fixing his gaze on that, becoming like to that, living by that".<sup>4</sup> This conception of Plotinus, though not identical with, is somewhat similar to and reminds us of the conception of *Jivanmukti* in Indian thought, especially in the Advaita

Vedanta of Sankara. Let us see at some length what Sankara has to say about *Jivanmukta*, a person who is supposed to be liberated while he is alive, a free man, in the Vedantic framework.

Before going into the details of *Jivanmukti*, however, I would like to say a few words here regarding another common aspect of Plotinus' and Sankara's thought. I do not think we can make much of the apparent resemblance between Plotinus' idea of unity and Sankara's idea of non-duality. In Advaita, non-duality is not the same as unity. Sankara is quite explicit about it. Moreover, the method by which Plotinus arrives at unity as the ultimate principle is not the same as the method adopted by Sankaracarya. I would therefore desist from highlighting these surface similarities between Plotinus and Sankara. But when we come to consider the life and conduct of a Sage, as envisaged by Plotinus, as also the life and conduct of a *Jivanmukta*, I think we are on surer grounds.

Whether one has his eye on unity as Plotinus envisages it or on the realization of the non-duality of one's own self as conceived in Sankara's Vedanta, one notices in both a unique equanimity and tranquility of mind very rarely found in ordinary human beings. Both the Sage and the *Jivanmukta* are happy under all possible circumstances. The above quotations from Plotinus speak for themselves; further Sankara in his *Vivekacudamani* says "*Sthitaprajna yatirayam yah sadanandamasnute*" i.e., he being a man of equanimity is always in a state of happiness.

"*Istanistarthasampraptau samadarasitayaimani, ubhayatra-vikaritvan jivanimuktusya laksanam*" says Sankara; whether something desirable or otherwise comes on his way, the *Jivanmukta* is not affected thereby, because of his equanimity. The difference between the enlightened who is free and the unenlightened who is in bondage is that the former remains undisturbed and patient through his affliction due to *prarabdha*, whereas the latter is impatient and suffers on account of this,<sup>5</sup> Plotinus says, "Adverse fortune does not shake his felicity: The life so founded is stable ever". and yet, as Plotinus has aptly observed, "this does not make the Sage unfriendly and harsh: it is to himself and in his own great concern that he is the Sage; giving freely to his intimates of all he has to give, he will be the best of friends by his very union with the Intellectual Principle". According to Sankara *Jivanmukta* or the enlightened person is both *vimuktasanga* (devoid of attachment) and *Karunyasindhu* (ocean of mercy) or *Sadaparadhyambuddhama* (for ever the boundless ocean of mercy).<sup>6</sup>

It may not be out of place here to point out that Russell's idea of emancipation, though not identical of course, bears a striking resemblance with the above ideals of the life of a Sage or a *Jivanmukta*. It may sound strange that the models of men set before us by a Plotinus or a Sankara should find an echo in the mind of an empiricist of the 20th Century, but one should not forget that Russell was after all a humanist also, a person who was very much concerned with human life and welfare. So when it comes to stipulating what constitutes the ideal life and conduct in human affairs, it is no wonder that a modern thinker's words should bear a striking resemblance to those of a Plotinus or of a Sankara when they refer to the life and conduct of a Sage or a *Jivanmukta*. This only speaks of a largely unfulfilled dream of mankind, or rather a dream that has been fulfilled only occasionally, if at all, in the unusual life and conduct of some extraordinary person.

The relevance of this model lies precisely in that it should serve as ■ beacon light for the entire humankind. "To abandon the struggle for private happiness, to expel all eagerness for (gratifying) temporary desire, not to burn with passion for external things"—this is emancipation or free man's worship as Russell<sup>7</sup> calls it; it is a beacon light, a model set before humans, irrespective of one's caste or creed, of the locality or time to which he may belong. This is true both in the case of the *Jivanmukta* of Sankara and the life of a Sage as Plotinus envisages it.

Whether it is the 'Sage' of Plotinus, the *Jivanmukta* of Sankara or an 'emancipated person' of Russell, these notions could be taken as performing only a regulative function in our discourse. If '*Jivanmukti*', 'emancipation' and 'Sage-hood' are taken as regulative concepts, if this is their logical status, or to use the well known Rylean terminology, their logical geography, then it would be not very reasonable to search for a *Jivanmukta* or a Sage amidst ordinary living human beings. But Sankara does not take '*Jivanmukti*' as a mere regulative concept, for a *Jivanmukta* alone can be the teacher and the guide of the unenlightened in the ocean of samsara, according to him. The Guru or the guide whom the inquirer (*tattvajijnasu*) is supposed to approach is described in *Vivekacudamani* as *akamahatah* (unsmitten by desires), *Brahmavittamah* (a knower of Brahman par excellence), *brahmanyuparata* (one who has withdrawn himself into Brahman), *ahetuka dayasindhu* (a boundless reservoir of mercy that knows no cause), etc.<sup>8</sup>

There exist great and noble souls, says Sankara, calm and magnanimous, who do good to humanity as does the Spring season, (*Santa mahanto nivasanti santo, vasantavaliokahitam carantah*), and who, having themselves crossed this dreadful ocean of birth and death, help others also to cross the same without any private motives whatsoever.<sup>9</sup> In this context, Sankara's words, *vasantavallokahitam carantah* (Doing good to humanity like the Spring) refer to the spontaneous goodness and kindheartedness of the enlightened, while they themselves remain unperturbed amidst pleasure and pain. This means that Sankara did not regard *Jivanmukti* as a mere regulatory concept. And there seems to be no sufficient reason to think that Plotinus regarded the concept of 'Sage' as a mere regulative concept either. I would therefore submit that all these thinkers took the concepts in question as having application in this world of ours; persons, according to them, should be judged in accordance with how near they got to such a perennial model of humanity, which though rare, is by no means non-existent.

## Man's Predicament—The Unique Indian Experience and the Neoplatonic Tradition

Gopal Chandra Khan

Writing on the history of Greek philosophy Edward Zeller acknowledged that of all the people of antiquity, apart from the Greeks, only the Chinese and the Indians were philosophers, though there is no connection between the philosophical systems of the Chinese and the Indians, nor between theirs and that of the Greeks.<sup>1</sup> About Indian Philosophy he comments: "The Indians have indeed produced various philosophical systems, but Indian philosophy never lost contact with religion and never became independent. Its other-worldly character seems strange to our mind."<sup>2</sup> On the other hand, Greek philosophy, in Zeller's opinion, was built up by the strength of independent human thought, by the *logos*, which claimed to explain reality in a natural way.

Zeller, however, noticed the absence of this original feature of Greek philosophy to a large measure in Hellenistic Jewish philosophy, in Neo-Pythagoreanism, NeoSkepticism and Neoplatonism, all of which were conceived in Alexandria where the Greek and the Oriental world met and mingled. He therefore regarded these as not truly Greek Philosophy. In particular, "neoplatonism with its need of revelation instead of independent investigation carried to its limit the development begun in neo-Pythagoreanism and thus completed the suicide of philosophy."<sup>3</sup> To sum up: Neoplatonism is not wholly Greek and not wholly philosophy; its unphilosophical character is due to the presence of oriental influence in it. It is needless to say that the "Oriental influence" that Zeller here speaks of is the Indian influence, and thus goes history.

In this short space we do not wish to contest Zeller, we only explain one meaning of philosophy that the philosophers of ancient India upheld. This meaning we observe the Neoplatonists also discovered anew or endorsed. This appears strange to Zeller because he shares the original Greek view according to which all philosophy begins in wonder, and

which Plato<sup>4</sup> and Aristotle<sup>5</sup> regarded as reason's divine discontent, prompting human beings to enquire into the secret springs and principles of (the world regarded as) nature and thence acquiring philosophical wisdom. It is certainly true that philosophical wisdom (*sophia*) in the Greek sense included not only a theoretical understanding of the world, but also a certain attitude to life; but philosophical wisdom always influences life. For the Greek it was the pleasure of philosophical wisdom that mattered; it tasted so good that the philosopher was prepared to renounce other mundane pleasures of life for its sake, and it was this intellectual pleasure that sustained philosophical enquiry in the original Greek sense.

Indians of the ancient world with their very long tradition in philosophical quest and enquiry have, however, their own experience from which to speak. They found that philosophic reflection that began in wonder, as soon as it ran its course, seemed to end in despair. Thus, instead of giving rise to intellectual pleasure it created intense intellectual pain; instead of making philosophic living possible it made life unbearable. The world on which the Philosopher naturally lived from the beginning of his life seem to have ultimately receded to an inaccessible distance. Left thus utterly abandoned and disconsolate he developed a deep crisis in his inner existence. He was now in a fundamental predicament; he should either give up philosophy and return to uncritical living or live in an understanding of the emptiness of the world and still live in that world. For the philosopher it was a trying situation demanding a prompt and quick solution.

From all accounts it appears that the Skeptics among the philosophers of ancient Greece also came up against these problems of philosophy. They found a quick solution in executing an *epoche* with regard to all philosophy, which they claimed gave them the peace of *ataraxia*. It is however, difficult to conceive the real import of *epoche* or the meaning of that peace which *epoche* claimed to have produced. In any case, Immanuel Kant thought that Skepticism is a relapse into the uncritical or unphilosophical attitude of mind.

The Indians never advocated skepticism, and neither did the Neoplatonists. Both the Indian Sages and the Neoplatonists wanted to be positive towards philosophy, and proposed identical solutions to the problems confronted in the course of philosophizing. They pointed out that the problems of philosophy never remain mere theoretical difficulties, but

enter into life in such ways as to constitute living experience. Thus in proposing solutions to the problems of philosophy they insisted upon a fundamentally new kind of experience. This new experience will come, they claimed, through a complete transformation of man's inner life.

It may not now be very difficult to see why philosophy was conceived as *mokshasastra*, or a discipline that leads to man's salvation. In India, they called it *paravidya* as distinguished from *aparavidya*. *Aparavidya* is mundane philosophy, or what Hegel regarded as 'thinking study of things'. It might well begin with wonder, but will ultimately end in chaos and confusion, getting life into its fundamental predicament and unresolved crisis.

Where *aparavidya* ends *paravidya* begins, for which crisis rather than wonder is the beginning. Its objective is not to satisfy man's intellectual curiosity but to bring relief to the tormented soul. The philosopher who exercises in *paravidya* is a lonely consciousness braving his way to recapture the world that once deserted him and threatened his existence. He succeeds in so far he truly expands or widens his inner life so that the whole of reality gets merged in it and nothing is left outside as the 'other'. Plotinus, the founder of the Neoplatonic tradition, also explained this possibility of man's inner development. He saw no possible limits to soul's possible expansion, no stopping place to fix its limits, and no demarcation line between itself and the 'All'.<sup>6</sup>

The older Greeks explained that wonder as reason's natural impulse pushes man into philosophy. But they did not further explain the significance of wonder in man's life, or for that matter admit any goal/fulfillment (*telos*) of reason. The Indians, on the other hand, explained man's philosophical enterprise as the soul's tryst with destiny. Man's life on earth is a journey towards truth. It is a painful and difficult journey, but reach the end of the journey he must; salvation through suffering is his destiny. Plotinus characterized it as soul's rough and arduous return journey, homecoming, as ascent to the union with the One, the All.<sup>7</sup>

The Indian experience says that man's life on earth is full of suffering. The opposite of suffering is bliss, but where is bliss in this world! There are only pleasures and pains. According to the natural tendency of the mind, pleasures are sought after and pains are sought to be avoided. But what initially appears to be pleasure ultimately proves to be pain in disguise. Actually, both pleasure and pain are suffering in different

forms. Then, what is the meaning of a suffering life? The Indians explained that suffering is a constant reminder to the sufferer that as yet he lives in unfulfilled purpose. Since the man feels the urge to achieve his goal, but has no clear knowledge of what he is seeking for, he is perpetually in distress. In other words, man's inner greatness as coupled with his basic ignorance is what the Indians called *avidya* (a beginningless cosmic nescience), and what Plotinus regarded as soul's *tolma*—an illegitimate self-assertion and desire of movement for movement's sake, or the movement of passage from one form of living to another.<sup>8</sup> Through constant suffering and constant enterprise he returns to himself, is redeemed, and his ordeal is over. In the beginning of his earthly life a man works with his natural belief that all that he covets is to be found in the world out there. But the world never satisfies him. His desire gets aggravated, and he becomes more and more restless. In this restlessness he sometimes starts reflecting. Through intense reflection he may realize that everything in this world is transitory, and that what he is seeking for is something permanent. This creates frustration, and his faith in the world gets shaken. Thereupon he tries to find a new ground, and until he finds it he suffers a deep crisis in his inner experience. In this his hour of spiritual distress, philosophy as *paravidya* comes forward as guide and brings him permanent relief. It shows the way to man's inner greatness, his divinity, which is beyond any meanness of the world. As long as man lives in ignorance of his basic spiritual identity, and regards the world out there as the only reality, he finds himself identified with his body, a small entity occupying an insignificant corner of the world. But if he ever learns to see his spiritual identity in its proper light, he discovers the divine in him, his true and basic self which is vastly greater than the world and which, instead of being supported by the world really supports the world.

As Plotinus described his ecstatic soul-experience: The soul is not in the body, but the body is in the soul, penetrated and enveloped by it; the soul is not in the world but the world is in the soul, as in his great image floating like a net in the sea.<sup>9</sup> It is a truly great experience which removes every uncertainty from one's life and resolves one's crisis once for all.

Standing on the verge of a century, thinking of welcoming the next, the twenty-first, our mind is none the less filled with gloom. What kind of a world are we living in, and what kind of a culture are we projecting—boxer is a nation's great man, a mass-meeting attended by millions is a triumph, a political theory is a consumer theory, the relation

between nation and nation is merely a trade relation, a presidential election is fought and won with a promise 'I give you my countrymen, more consumer goods', and such further nonsense! What stupid answers we give to the great philosophical question; what is Man?—Man is conceived as a mere creature of flesh and blood, a producer of consumer goods and a consumer.

But what will happen to this endless consumerism? What if no viable alternative source of energy comes up? What if population explosion continues unabated? What if the ozone layer goes on decaying this way? What if the planet becomes uninhabitable? Through all this turmoil, hopefully one question still arises in our mind: Why is man so lacking in himself? Is he born to be ever defeated? Our great ancestors showed us the way. We must be reborn in their philosophies and struggle to bring back the divine in man to the divine in the All. We shall resolve our crisis in the same way as the great Valmiki, the author of the Ramayana, the great Arjuna, the mighty warrior of the Mahabharata, and the great Siddhartha, who later became the Buddha, resolved the crisis of their lives.

Rationality and Ritual  
in Neoplatonism

Robert M. Berchman

## Introduction

It has become the practice in the present day to regard Neoplatonic ritual as a sign of the decline of ancient philosophy into superstition.<sup>1</sup> In one form or another this interpretation has prevailed throughout this century.<sup>2</sup> In these approaches it is assumed that there is little about Neoplatonic ritual that reflects rationality.

Although there is much that can be learned from these studies, it is also the case that no one has paused to examine the adequacy of their particular notion of rationality for the separation and explanation of ritual, philosophy, and science. Very briefly: it is a hypothetical-deductive model of rationality with a notion of correspondence rules. It can be summed up as follows:

According to this account, scientific theories, the foundation and success of modern knowledge, are based on a distinction between theoretical terms ("entities" or "forces") and observational terms ("observed happenings"). Correspondence rules (operational definitions, rules of interpretation) define the theoretical terms, guarantee the cognitive significance of theoretical terms, and specify the procedure for applying the theory to what is observed.<sup>3</sup>

It is on this model of scientific explanation that philosophical and scientific knowledge are marked off from religious thought.<sup>4</sup> Unobservable entities, mystical notions, or metaphysical entities are excluded by this model of rationality. Since they are beyond empirical verification or falsification, religious belief and rituals are judged as nonsense, or unintelligible.

This model has been thoroughly dismantled by contemporary philosophers of science on the basis of its notion of "correspondence rules," which relate invariant observational statements to unobservable entities in theoretical statements.<sup>5</sup> The very validity or coherence of

correspondence rules marked the demise of the nomological-deductive model of science.

This fact is significant for the purposes of this study because it requires us to seriously question traditional approaches to rationality and ritual in Neoplatonism.<sup>6</sup> More significantly, it compels us to find another definition of rationality.<sup>7</sup>

Symbolic and rationalist attempts to define rationality argue that rationality is a means/ends decision-making process.<sup>8</sup> It is instrumental. For a belief or action to be rational all that is required is that there be good reasons, or a requirement of adequate evidential support for them. In short, rationality involves pursuing ends that are coherent, and employing means that are appropriate to those ends.<sup>9</sup>

A person is considered rational when (a) he pursues ends that are mutually coherent, and (b) he employs means that are appropriate to the ends pursued: "the critical appraisal implied by the attribution of rationality is, judged in light of the agent's belief, the action he decided upon constitutes a reasonable or appropriate choice of means for achieving his end."<sup>10</sup>

This means that if we are to choose a rational course of action in pursuit of given ends, we have to take into account all available information concerning such matters as the particular circumstances in which the action is to be taken; the different means by which, in these circumstances, the given ends might be attained; and the effects that may be expected from the use of the different available means in pursuit of ends.<sup>11</sup> Thus, to judge the rationality of a decision, we have to consider what information is available to the decision-maker, what reasons did he have for believing it true, and its suitability, judged by the information, for achieving its specified objective. Rationality can be adequately defined as a means/ends calculation. Rationality is instrumental, and the criteria of rationality are provided by the believer who culls them from his cultural system.

This definition of rationality allows Neoplatonic ritual action and belief into the domain of rationality.<sup>12</sup> It may well be that these ritual beliefs are mistaken, but this does not imply irrationality, or sheer non-rational expressiveness. For within its Neoplatonic cultural context ritual stands as an element within a wider rational system. Its means are appropriate, and its ends are coherent because for later Platonists ritual is among the best ways of accomplishing a series of intended objectives, such as the ascent of the soul and communion with the divine.

It is suggested that much can be drawn from this definition of rationality and approach to ritual for the study of cognition and magic in Neoplatonism. Plotinus, Porphyry, Iamblichus, and Proclus can be used to illustrate the extent to which ritual reflects a kind of rationality, for these Neoplatonists grounded much of their theurgical beliefs and practices on a means/end calculation.<sup>13</sup> What needs to be done is to describe and interpret the data available concerning theurgy. We need to know what these Neoplatonic agents believed about ritual, and why they thought it rationally plausible.

The issue addressed in the following pages is the examination of Neoplatonic views of the relationship between cognition and magic, culled from the writings of Iamblichus and Proclus. To keep this paper within appropriate limits and yet show the range of functions which rationality and ritual display in Neoplatonism, the discussion will concentrate on Neoplatonic views of cognition, their understandings of the means/end relationship between cognition and ritual, and their judgements concerning the rationality of ritual. These are largely based on epistemological and psychological grounds.

## I. Thesis

Plotinus and his heirs stand at an important point in the history of the interpretation of the rationality of ritual. With caution the following can be said of later Platonic views of cognition, the relationship between cognition and ritual, and the rationality of ritual:

A. The starting point for the study of rationality and ritual in early Neoplatonism is epistemology:

- The notion that the mind perceptively imagines being erases a divided line which linked perception with particulars and intellection with universals.
- The notion that a sensible thing instantiates being marks an inversion of an older Platonic paradigm which claims that a sense object imitates being.

B. The reification of perception and imagination forms the basis for the legitimization of magic and theurgy by Neoplatonists:

- This intelligible world is instantiated in sensible objects such as statuary or in sensible things such as temples.
- Through perception one imaginatively gains entrance to the intelligible world, thereby attaining communion with the gods.
- Through perception the soul imaginatively grasps a divine world and gains salvation.
- Ritual and the salvation of the soul are intimately linked to one another. Attainment of the intelligible world and communion with the gods is effected through theurgy.

C. These notions constitute the main source from which a theory of the rationality of ritual are constructed:

- Ritual is efficacious in terms of means because there is adequate epistemological evidence to suggest that theurgy is suitable for achieving its specified objective—entrance into the intelligible world and communion with the gods.
- Ritual is done for certain reasons. It can be explained as a means to an end—the salvation of the soul.
- Ritual can be rationally explained and justified from within a massive network of philosophical postulates. It can be explained holistically as elements within a rational system.

## II. Definition of Topic

What is implied in the simple Greek word *lagon*, hip? Historians of Neoplatonism can be trusted to ask such questions. The occasion is famous, the figure celebrated. Hecate's hip pours forth a divine oracle; Porphyry and later Proclus are suitably present ready to give the correct interpretation:

About the cavity of the right hip is poured forth in abundance the plenteous liquid of the primordially generated soul who entirely ensouls the light, the fire, the ether of the worlds. In Hecate's left hip exists the source of virtue which remains wholly within and does not give away its virginity.<sup>14</sup>

If it is possible to imagine such hips you have entered the world of Neoplatonic philosophy and religion. For by (*lagon*) Porphyry and Proclus mean that Hecate's flanks symbolize cosmic order and virtue. One hip contains the signs (*symbola*) of the natural order and the other is

the source of the sublunary virtues (*aretai*) the goddess dominates. Such hips require a brief summary of their significance.

Hecate clearly possesses hips worthy to be remembered. Yet what makes them so memorable? To appreciate the boldness of this later Platonic proposition we need only to contrast it with the earlier Platonic one.<sup>15</sup> For early Platonists a statue of Hecate visibly imitates transient becoming. For the Platonist *aisthesis* yields an opinionated reflection of the transient, physical arrangement of the sensibles, not a true perception of the ideas or the symbols of the gods. Consequently, her hips aesthetically symbolize particulars—they are mere icons of cosmic order and virtue.<sup>16</sup> For later Platonists a statue of Hecate visibly embodies ideal being. Her hips noetically symbolize universals—the right cosmic order and the left the source of virtue.

The notion that *aisthesis* deals only with particulars, while *noesis* only refers to universals, is called into question by this imaginative, Neoplatonic perception of Hecate's hips. For the Neoplatonist perception (*aisthesis*) provides entrance into an imaginative apparition of the fixed, noetic order of the intelligibles, even of the divine forms themselves. This understanding of the relation between perception and intellection is unknown in the early Academy.

The effects of this Neoplatonic proposition are considerable. If Hecate's hips had captivated Porphyry and Proclus merely in the manner they would have pleased Plato, we would not be reflecting on her statuesque anatomy in the manner of the two Romes, the old one on the Tiber and the new one on the Bosphorus—but in the manner of classical Athens where Plato taught that rationality and ritual were not complementary, but exclusive notions.<sup>17</sup> This position is overturned, beginning with Plotinus.

## I Iamblichus

### A. Aesthetic Pattern

At this point, Porphyry puts his finger on the central difficulty in all attempts to elevate *aisthesis* to the level of *noesis*. Beyond the indirect evidence of sense perception lies the solid evidence of the intellect. Knowledge of the intelligible world and union with the divine depends on intellection of the intelligibles, not perception of the sensible world and apperception of images of intelligible forms and the gods.<sup>18</sup>

Perception depends on the speculative interpretation of the imagination and this evidence has to be recognized for what it is. For Porphyry, like Plotinus, the difficulty with perception is an acute one. Little more can be made of its evidence than that it yields reasonable symbolic forms. Until some solid evidence was found to indicate that perception is intellection, then Platonists could do no more than ask how intelligible forms might appear in nature and so sketch the outlines of possible epiphanies. Thus even at the beginning of the Diocletian era, with the great period of ancient philosophical thought behind them, the men and women of Athens, Alexandria, and Rome knew little more than their predecessors about perception, or the remoter faculty imagination—and that was precious little.

So at the end of the third century, a vision of knowledge remained, fundamentally as Plato envisioned it. However, a way to break through the divided line had been conceived in the new extramissive epistemology. But until some principles were established to control and render nugatory arguments that perception remains opinion, until some reliable modes of inference had been worked out, by which the noetic barrier could be outflanked or overleaped—claims about the truth character of perception were necessarily speculative. For the theoretical possibilities they imagined far outran the facts available to them as evidence.

The flanking of the noetic barrier is evident from a glance at Hecate's thighs. The sheer extent of their symbols and virtues, which before the fourth century Platonists might guess but never prove, are accepted and proven afterwards.

### B. The Descended Soul, the Vehicle of the Soul, and Divine Causality

This raises the question of motivation. Iamblichus' conception of a dynamic order of reality, its perceptive appropriation and manipulation, which played so large a part in later Platonism, was the product of two factors, each of which tended to strengthen the other. One of these was the acceptance of the theory of divine giving as the basis of ontology and epistemology;<sup>19</sup> the other was the adoption of the doctrine of the descent of the soul as the foundation of psychology.<sup>20</sup>

Taking these together, Iamblichus recognized that the state of the soul—her descent from the hypercosmic realm into generation in stages—resulted in subservience to fate.<sup>21</sup> The reversal of this situation of misfortune dominates Iamblichus' thought. This leads the philosopher to include a place for the vehicle of the soul in his explanation of the descent and reascent of the soul.<sup>22</sup>

To briefly describe Iamblichus' view of the soul's vehicle (*ochema*): it was created by the demiurge; it is not merely generated from portions of the bodies of the visible gods; it is not fated to remain in the material realm. For the philosopher, then, the vehicle has a divine origin; it is ethereal; and it is not subject to destruction or dissolution of any kind.<sup>23</sup>

The descent of the soul involves demiurgic sowing; her encosmizing with vehicle into the visible gods:<sup>24</sup>

....the demiurgic sowing of souls will be divided around the divine creations.<sup>25</sup>

This sowing has a major consequence for it makes each soul fall under its own saviour and patron god:

But they (i.e., the souls) made their first descent when they have already been sown around the visible gods in order that they might have the gods as saviours (*soterai*) of their wandering around generation and that they might call upon them as their patrons (*prostasis*).<sup>26</sup>

Each created thing falls into four classes: the heavenly class of gods; the winged class that traverses the air; the class that lives in water; and the terrestrial class.<sup>27</sup>

Mortals are not joined to the gods but require intermediaries.<sup>23</sup> Since the sowing is not merely of human souls their vehicles and their own gods but also angels, daemons, and heroes, human souls can call upon these greater souls to aid them in their reascent.<sup>29</sup> Thus each soul has its own saviour god and patron powers.

Generative sowing involves the descent of the soul and its vehicle into matter.<sup>30</sup> This procession (*proodos*) from the mixing bowl determines each soul's cosmic rank.<sup>31</sup> From the place allotted to the soul in sowing, she makes her descent into generation. Embodied the soul is no longer a rational soul existing apart from its vehicle. She exists together with her vehicle in the sensible realm.<sup>32</sup>

According to Iamblichus each soul can project a *logos* (*logon proholai*)<sup>33</sup> and leads a life in harmony with a god.<sup>34</sup> For example, projecting a solar life means the soul takes on the *logos* of the physician and is connected with Asclepius or takes on the *logos* of the telestic and is associated with Apollo.

There appears to be a necessary law that requires the soul's descent.<sup>35</sup> Nonetheless, the soul can either assent and descend voluntarily or resist and be compelled to descend.<sup>36</sup>

Those who descend by choice are pure and perfect souls without passions and not deprived of intellect. They descend for the benefit of the sensible world. They remain in contact with the noetic realm and, thus, are purified from all stains and sin.<sup>37</sup> Some souls are so pure that their descent does not involve generation at all. Thus they enter the material realm and are not contaminated by it. These souls serve the lesser ones in the lower realm.

Souls also voluntarily descend to train and correct their characters.<sup>38</sup> These are souls between purity and impurity, impassivity and passivity who are given the opportunity to better themselves and become fully pure.

Those who resist descent and violate divine and cosmic law are souls who must descend for punishment and judgement of sins committed in a previous life.<sup>39</sup> These impure and passionate souls are sent to Hades and rehabilitated. Upon completion of their sentence they can choose their next life.

With these aspects in mind Iamblichus makes the argument that it is theurgy and not contemplation that brings salvation to the soul. He builds his thesis on two foci: that happiness is union with the gods;<sup>40</sup> and that liberation from fate occurs through knowledge of the gods.<sup>41</sup>

Happiness and knowledge together is defined as wisdom (*gnosis*). This wisdom and union (*theia henosis*), the first road to happiness, is caused by theurgy.<sup>42</sup>

Theurgic rites purify the soul, liberate her from fate, and permit union with the gods.<sup>43</sup> Purification involves the cleansing of the vehicle of the soul.<sup>44</sup> Once purified the soul can associate with the gods. They shine (*epilampontai*) their light upon the soul, freeing her from passions and disorderly motion. Once illuminated the soul begins its elevation to the gods.

In ascent the soul is granted gifts which include health of body, virtue of soul, and purity of intellect.<sup>45</sup> The entities that bring about these purifications are the visible gods.<sup>46</sup> These are the soul's leader gods. Thus if the soul is mercurial her purifications are done by Mercury; if helioteic her purifications are undertaken by Apollo. Once reunited with its god, the soul joins its entourage.

With ascent the soul is also liberated from fate.<sup>47</sup> She separates and leaves her irrational part and vehicle behind in the cosmic realm.<sup>48</sup> These elements are the organs for the soul's lower functions. The irrational soul functions as appetite and desire; the vehicle as sense perception and imagination. Useless in the higher realms they could be detrimental to the soul's existence, binding her to fate.

For Iamblichus the irrational soul and vehicle remain in the divine entourage with the rational soul but only the rational soul beholds the forms in the noetic realm. This he pictures in his interpretation of the *Phaedrus*. The charioteer with his head views the forms in the noetic realm and then descends to rejoin his lower self.<sup>49</sup>

The vehicle's fate is to be reunited with the ethereal vehicle of the visible god, the soul's leader-god. Once accomplished the vehicle and irrational soul are purified and liberated from all irrational activity.<sup>50</sup> This permits the rational soul to ascend and unite with the demiurge and, perhaps, the hypercosmic gods, if not the One.<sup>51</sup> This, then, is how Iamblichus conceived of the descent and ascent of the soul. Even here, perhaps, we catch a glimpse of his defense of the faculties of perception (*aisthesis*) and imagination (*phantasia*).

### C. The Aesthetic Imagination and Theurgy

It has been shown that the vehicle controls the functions of sense perception and imagination, the irrational soul functions as appetite and

desire. However, the vehicle which also houses the rational soul can be purified by divine light. In the theurgic act the gods illuminate:

...the ethereal and luminous vehicle that surrounds the soul. From this (i.e., illumination) divine images take hold of the imaginative power (*phantastiken dynamin*) in us, images moved by the will of the gods.<sup>52</sup>

The vehicle of the soul (*ochema*) is illuminated by an evocation of light (*photagogia*). These divine apparitions (*phantasiai*) move the soul's active imagining perception (*hen en hemin phantastike dynamis*). Thus the divine vehicles are made visible through theurgy.<sup>53</sup>

When the vehicle is illuminated images of the god are impressed upon it. Normal sense perception (*aisthesis*), consciousness (*parakolouthesis*), and intuition (*epibole*) cease. In this state the vehicle's theurgic function is to be filled with divine images. Indeed by this means divination occurs.<sup>54</sup> For Iamblichus the imagination (*phantasia*) does not perceive mere material images or sense impressions. It grasps divine images directly. Plotinus' theory of the imagination is reinterpreted in a profound way.<sup>55</sup> For the soul's purification and ascent not only begins but ends in the sensible realm.

For Iamblichus it is theurgy and not contemplation that brings human salvation. Philosophy is secondary to ritual. The human soul cannot save itself but requires the help of the gods. Indeed, throughout the entire cycle of her existence, the human soul is in the hands of the gods. Sent to the earth by the gods, the soul requires their help to reascend. Thus:

...it is not thinking (*ennoia*) that unites theurgists to the gods...what hinders those philosophizing by contemplation (*theoretikos*) from having theurgic union with the gods? But such is not the case. Rather, the efficacy of ineffable acts accomplished divinely (*theoprepos*) beyond all intellection and the power of unspeakable symbols understood only by the gods impart theurgic union.<sup>56</sup>

Thus bit by bit, the derivative nature of perception, ■ principle upon which Platonic epistemology rested for half a millenium, was challenged. Now it would be dismantled. The ineffable character of intellection would be grounded in the intuitive nature of divinely given perception.

This dismantling emerges with Iamblichus:

The apparition of the gods gives us physical health and virtue of the soul, purity of mind, in short, an ascent of our whole inner existence towards its proper beginnings.<sup>57</sup>

The philosopher begins with the assumption that the gods are perceptible. Moreover their apparition brings to the soul a reversal of her situation of misfortune. The whole point of knowledge lay in its therapeutic and salvific content.<sup>58</sup> These two elements dovetail neatly together. Divine giving manifests itself apparatively. Its symbols are physical and psychological well being, intellectual purity, and union (*henosis*) with the gods.<sup>59</sup>

Other notions inherited from science, magic and ritual fit into Iamblichus' picture, like pieces in a jigsaw. Scientists in late antiquity assumed the familiar interaction of the heavens and the earth.<sup>60</sup> This assumption served as the basis for a system of sympathetic and homeopathic correspondances.<sup>61</sup> Each dæmon and god was associated with particular plants, minerals, animals, and parts of the human body.<sup>62</sup> Therefore, Iamblichus concludes, matter is not necessarily evil.<sup>63</sup> Indeed, there is a kind of matter which is pure and divine and does not prevent us from communicating with the gods. It is a kind of receptacle for their manifestations on earth.

The interconnections which Stoic philosophers treated as links in a deterministic network were now transformed into channels for divine power. Every astral deity fills matter with its own power (*dynamis*). They, in turn, interact with higher, intelligible deities, who in turn, have their source in the hierarchy of Ones which are the ground of all reality.<sup>64</sup> Like some great source of invisible energy, the primal One directed its influence from the recesses of the intelligible world to the physical world, along the conducting paths established by these correspondences.

It is a short step from endowing the physical universe with divine power to assuming that sense perception (*aisthesis*) is in harmony with intellection (*noesis*). From the humblest and most imaginative of sense-perceptions at one end, up to the highest and most complex of intellections at the other, there extended a single divine, intelligible power. Therefore, perception like intellection has a truth character.

In this way, pieces from the whole corpus of ancient science and philosophy were brought together and combined to offer evidence of the truth character of perception. For the central question in Platonism stubbornly concerned the relationship between the divine and human minds. Since the world was an organism whose continued existence was

sustained by divine intellection (*noesis*) and will (*boulesis*), it seemed natural to measure the value and authenticity of all human knowledge by tracing it back to its source.

For Iamblichus the sense of sight became a pre-eminent means by which to acquire knowledge and divine union.<sup>65</sup> Every aspect of sensation has its intelligible association. Sensible knowledge, then, is the starting point of a more refined and potent intelligence. It no longer is a mere imaginative reflection of reason.

#### D. Perception and Salvation

The full consequences of this reformulation have not always been appreciated.<sup>66</sup> Certainly the epistemologies of Plato and even Plotinus have been left far behind. But in their place stands a theory of knowledge that fit the reasons, fears, and ambitions of later Roman men and women.

As a rule, active, immaterial properties are associated with material things. Moreover such relationships are knowable, at least initially, through sense perception. If communication is desired with the source of these properties then prayers, formulas, and epitheta bring the supernatural being before the invocator. Moreover language and its symbols (*symbola*) and tokens (*synthemata*) represent the supernatural powers invoked.<sup>67</sup>

Iamblichus, therefore, distinguishes three kinds of ritual prayer: the one that brings together (*synagoga*); the one that ties together (*syndetikon*); and the union (*henosis*).<sup>68</sup> Hieratic utterances function as a path to knowledge. This idea that discourse depends on the capacity for analogy exemplifies the kind of metaphoric theory of language held by the philosopher.

Discourse accommodates purpose. Thus the uttering of the names of the gods, the invocation of ritual prayers and the use of divine symbols make the ascent of the soul possible. For such discourse results in the appearance of a daemon or god which leads, hopefully, to communion if not union with the divine.

This accommodation of language and purpose is a darling of Iamblichus. He found in this analogy the kind of metaphoric thinking knowledge requires in order to achieve the ascent of the soul. What is required are:

...hieratic supplications... (and a) ritual which involves...admirable signs (for) the ineffable expresses itself in unutterable symbols...<sup>69</sup>

These symbols and signs placed in the hollow statues of the gods animate them at the right moment and bring an apparition of the deity before its supplicants.<sup>70</sup> An intangible and incorporeal spirit appears and surrounds, as if in a circle, those present. Initially it is not perceived or registered as it enters. Then it swishes and this noise (*roizos*), the sound of a whistling arrow, is symbolically interpreted as the divine spirit approaching the human soul.<sup>71</sup> This pneumatic noise has its corollary. It is also the sound made by the stars in their celestial revolutions.<sup>72</sup>

Clearly, hieratic discourse represents the supernatural powers to be invoked; the statue establishes a firm and direct link between the god and his followers.<sup>73</sup> These pneumatic statues were channels through which humans could tap divine power thereby achieving salvation. If not that at least through such *paredroi theoi* ancient Mediterranean men and women attained protection of self, house, city, or country.<sup>74</sup> Although the statue of a god is a material object, Iamblichus reminds us, matter (*hyle*) is also offered by the gods for it is congenial (*symphyes*) to them. Pure and divine it is their receptacle for their manifestations on earth.<sup>75</sup>

Thus a new ingredient enters an ancient equation. Divine sympathy pulsating throughout the universe not only manifests itself universally but also particularly in matter. Although Plotinus accepted this notion, in theory, he saw any manipulation (*goetein*) of cosmic sympathy: "the sum of love and hatred in the universe".<sup>76</sup> Moreover such manipulation of natural sympathy diverts the soul from intelligible to sensible activities. Since these are intrinsically deceptive and incapable of elevating the soul to a knowledge of intelligible reality, Plotinus rejects the proposition that manipulation of natural sympathy leads the soul to the divine. Contemplation (*theoria*) is sufficient to free the soul and catapult her to the gods.<sup>77</sup> Porphyry also noted these facts and was wary for they led to the use and abuse of the gods.<sup>78</sup> Iamblichus, however had fewer reservations. Theurgy replaces and supercedes all philosophy and theology.<sup>79</sup>

These objections to magic and theurgy had to do with their theoretical assumptions. Beliefs about the interaction between the intelligible and sensible worlds, sensible and intelligible knowledge, however, were only the starting points. It was the ambition of magic and theurgy that kept them under a cloud. Both were suspect, as being excessively presumptuous. The theurgist was attempting to sense and manipulate what the intellect alone could know. Moreover, the theurgist

aimed at power over the soul and nature of a kind reserved for the intellect and the gods.

Moreover the natural world pictured by Iamblichus, of symbols (*symbola*) and conventions (*synthemata*) which link every physical thing 'here' with intelligible principles 'there', was impossible.<sup>80</sup> Scattered throughout the material universe by the gods they were known to theurgists who used them achieve union with the gods.<sup>81</sup>

Yet, as Plotinus and Porphyry proposed, this axiom could not be easily reconciled with Platonic teachings on knowledge and being. The theurgists of late antiquity were hard pressed to match their sympathetic view of nature and the fallen soul with earlier Platonic formulations.

The compromise eventually achieved by Iamblichus depended on making the doctrine of knowledge a matter for initiation rather than reason. Plato had not really proved that sense-perception could not attain epistemic veracity.<sup>82</sup> Rather he had demonstrated that intellect proved to be a more credible instrument of knowledge.<sup>83</sup> If this were so, reason alone could not establish either. Thus, the veracity of sense-knowledge was not one to be argued out rationally but had to be decided by other means—and these Neoplatonists were fortunate, in having the question settled for them in the Chaldaean Oracles, collections of *logia* in Greek hexameter.<sup>84</sup> Known to the third century Platonists Porphyry and Iamblichus,<sup>85</sup> they became so influential that Proclus saw their source in Plato and Plotinus.<sup>86</sup>

## II Proclus

### A. Aesthetic Pattern

The compromise eventually established by Iamblichus and Proclus was achieved only at a price. Questions about theurgy opened its assumptions to scientific and philosophical discussion. The full consequences of this fact have long been recognized but misunderstood.<sup>87</sup> To characterize Proclus as exhibiting an incurable weakness for the occult and his Platonism as an example of a decline in the Greek rationalist tradition would be to take too one-sided, if not anachronistic view of their thought.<sup>88</sup>

Theurgic Neoplatonism is not so much evidence of a decline into the irrational, the triumph of superstition over reason, reflecting the general malaise of later Roman society,<sup>89</sup> as it was an attempt by some to expand Platonic theory beyond the frontiers of Plotinianism.<sup>90</sup>

It was in Hellenic Neoplatonism that the hold of theurgic tradition on men and women's minds proved most tenacious and long lasting.<sup>91</sup> In their minds supernatural power is inherent in the world of the phenomena that surrounds us. Divine power can be activated and theurgy is the theory and practice of divine activation.<sup>92</sup> Consequently, a vision of reality emerged, fueled by the fall of the soul, her purification, and her ascent that reconciled Platonism and the theurgic mysteries.

Porphyry and Iamblichus had taken crucial steps towards legitimizing theurgic Platonism. In Iamblichus' eyes theurgy was a divine phenomenon to which there was no higher counterpart. Proclus agreed and his works were the first sustained systematic attempt to complete this account of reality. Thus by the early fourth century Platonism had solidified its interaction with theurgy. From the second half of the fourth through the late fifth century philosophical debate had replaced the Plotinian view of reality with a Proclean one that would survive another millenium.

### B. Hieratic Art and Allegorical Physics

Taken separately, few of Proclus' chief steps were entirely new. What distinguished Proclus was the cumulative weight of his whole system. He

drew together into a unified whole theories that had previously developed almost randomly. His strength was that he patiently settled down to work out the actual interrelationship demanded by such metaphysical and theurgical premises. After painstaking research he concluded that theurgy:

...is a power higher than all human wisdom, embracing the blessings of divination, the purifying powers of initiation, and in a word, all the operations of divine possession.<sup>93</sup>

How and why he reached this conclusion must be examined. Both questions involve issues central to aesthetics. They are mediated through Proclus' physics, epistemology, and psychology.

Convinced that the hieratic art leads to the union of the human soul with the One, Proclus understood theurgy as a process of deification which completes, and does not render nugatory, contemplation.<sup>94</sup> Indeed as the crown of contemplation, theurgy is a supremely noetic act, encompassing all the contemplative and active attributes of worship.

The hieratic art is possible to know and to practice because divine power pulsates through the universe and is inherent in the natural phenomena that surrounds humanity. This vision allowed philosophical issues a more significant place in theurgic Platonism than is generally recognized.<sup>95</sup> Proclus attempted to place the practice of theurgy on a theoretical plane by hard-wiring it into the first principles of natural philosophy.

He made the familiar interaction between the noetic and physical worlds the basis for a complete system of correspondences whose interconnections were understood as channels for divine power. Taking over from the ancient Ptolemaic astronomers the theory of the heavens comprised of some sixty concentric translucent spheres, the earth being at the center and the sphere of fixed stars enclosing the whole system, Proclus allegorized this picture to symbolize the degrees of reality and perfection between matter and the ineffable One.

The poetic value of astral religion was reinforced by his Neoplatonic interpretation of Aristotle's 'quintessence'—the imperishable substance of the heavens—exempt from the change and decay afflicting terrestrial things. With Proclus an astronomical nest of crystalline spheres became the accepted symbol for the scale of cosmic perfection. Things on earth were lowest, both in location and worth. The passage upward through the spheres of the moon, sun, successive planets

to the outermost heavens, and then through the crystalline barrier to the hypercosmic gods, represented a soul's journey from corruption to perfection.

The natural world was an organism whose continued existence was sustained by a divine noetic act, thus it seemed essential to describe and measure the channels of divine power by tracing them back to their supreme source. This became the point of a great deal of metaphysical debate which was a stimulus to novel developments in Neoplatonic epistemology, psychology, and physics.

Seen against this background the intellectual preoccupations of Proclus are understandable. Neoplatonic epistemology and psychology were reinterpreted in a similar allegorical way. For his central question concerned the relationship between the divine and human intellects and the union of the human soul with the One.

### C. Perception, Imagination, and Theurgy

Proclus, for example, came to recognize sight as the pre-eminent means by which we acquire knowledge of the supernatural power immanent in the world. He identified light as the spiritual bond linking the human intellect to its divine origin. Consequently he valued sense perception as the mental faculty responsible for receiving, integrating, and interpreting the photogenic images and forms presented to the intellect.

To Psellus we owe a number of valuable notes and comments from Proclus on this branch of aesthetics.<sup>96</sup> He studied the conditions under which invocations (*kléseis*) take place and the locations where they were performed. He noted that before and during rituals the participants avoid any activity which interferes with the arrival of the gods. They also maintain absolute quiet.

Again and again he was drawn to the phenomenon of divine light, its shapes and symbols (*schemata tauta kai theia synthemata*). Some appear to be lifeless objects, others living beings. Some are endowed with reason (*empsycha logika*), are not (*empsycha alogika*). Statues are filled with divine light when inspired by a god or daemon and deliver oracles.

When supernatural beings self-manifest (*autophaneia*) in statuary they appear in shapes and forms perceptible to the senses. Proclus reports that although divine beings are incorporeal:

...bodies were attached for your (sic. gods) sake to the self-revealed manifestations, as you are grafted upon a corporeal nature.<sup>97</sup>

They may appear in symbols (*symbola*) associated with the divine being. For example, Hecate's symbol is the Lynx. She often manifests herself in a top (*sgrophalos*). Clearly, the art object is linked per analogiam to the goddess. Once manifest in her plastic image she has made that journey from her abode at the acme of the celestial sphere to a locus in the terrestrial sphere.

Proclus reports this is represented symbolically. A disc of the moon was located on the statue's back. Proclus tells us this symbol represents the power the goddess wields over the intra-mundane regions. For this heavenly sphere, called nature, is the abode of Hecate. For she is the ruler of the visible world and resides at its acme as the self-manifesting image of nature.

Proclus even clinically examined those who saw such light. They receive the divine spirit and are possessed by it (*katochoi ginontai, theoleptoi kalountai*). The philosopher noted that this experience was always spontaneous (*aristios*) even though with some it was continuous and with others intermittent. Some mediums are unconsciously ecstatic, others are consciously possessed. Spiritual light was thought to confer a special radiance on its possessor, which in turn could be transmitted to others.

This is what Proclus means when he says that there is a contemplative prelude to theurgy. Before one can practice theurgy one must understand its physical environment; its psychological and epistemological contexts. Moreover, these studies were no stumbling block between the Platonist and salvation. Indeed, they were a necessary propaedeutic. Philosophy had much more to do than fetch and carry for the wisdom of the Chaldaean oracles. Theurgy, therefore, was a scientific art based on observation where the theurgist applied sensible knowledge towards a particular goal—the activation of divine power in the universe.

For Proclus theurgy has two foci: it is an activity, an operation, a technique dealing with the gods based on observable principles; it is also the worship of the gods. Consequently, it is a priestly art (*hieratike techne*).<sup>98</sup>

Its purpose is to evoke a god (*theagogia*) by evoking its light (*photagogia*). This evocation of light illuminates the vehicle of the soul (*ochema*). The result is divine apparitions (*phantasiai*) move the soul's

active imagining perception (*hen en hemin phantastike dynamis*) and the shiny vehicles of the gods are seen.<sup>99</sup>

#### D. The Descended Soul, The Vehicle of the Soul, and Divine Causality

To appreciate the weight that theurgy had upon the perceptions and imaginations of later Roman men and women requires us to return to a psychological problematic—the fall of the soul. By Proclus' time the fall of the soul had become accepted as a symbol for the individual's plight.<sup>100</sup> Her reascent, her journey from corruption to perfection was, for Proclus, a matter of aesthetics.

Proclus, like Porphyry and Iamblichus, maintained the theory of the descended soul. The process of descent is familiar. Proclus sees the soul's movement from the hypercosmic realm to generation as occurring in stages. First the soul is above fate and then upon embodiment becomes subservient to it. There are a series of stages between freedom and slavery.<sup>101</sup> There is the first hypostasis, the distribution, the sowing, the assignment of allotments, and then the descent.<sup>102</sup>

The first hypostasis refers to the soul's hypercosmic life when it is separated from the cosmos and her vehicle.<sup>103</sup> The distribution is the allotting of souls under divine circulations, or the hypercosmic gods.<sup>104</sup> The sowing represents the establishment of the soul and her vehicle into the circulation of the soul's cosmic or visible god.<sup>105</sup> This represents her placement in the heavenly lexis from which the soul either rises to the noetic or descends to the sensible realm.<sup>106</sup> Descent entails the soul's placement of the soul into the four different classes of living things: the heavenly, the winged, the watery, and the terrestrial.<sup>107</sup>

The soul's initial genesis, or sowing, represents her descent from the noetic to the physical realm.<sup>108</sup> Allotted to a visible god the soul takes on the characteristics of her patron and chooses a life.<sup>109</sup> This is what Proclus means by *logon probolai*.<sup>110</sup> However, the soul can choose to life this life rightly or wrongly.

Since Proclus understands this sowing to occur under the young gods, it places the soul under the aegis of the earth, the moon, and other organs of time.<sup>111</sup> Consequently, this sowing involves the soul together with its vehicle. Together they are arranged under the circulations of the celestial gods. This effects a two-fold connection between human souls and the gods. The soul's power is encompassed by the soul's god and the

soul's vehicle is filled by the god's vehicle. Thus the human soul and vehicle are filled by the god's personal nature.<sup>112</sup> Divine and human soul and vehicle are conjoined. Next Proclus states that the sowing occurs in each element (*stoicheion*) under the moon. This includes the four regions divided into the four elements. This explains the difference between different human souls. They are coupled to distinct comic deities.<sup>113</sup> Then the souls hear their fated laws.<sup>114</sup>

At this point the human soul is separate from the divine. Nonetheless, the demiurge:

...himself generates the vehicle of the soul and every life in it, to which the young god's weave the mortal form of life.<sup>115</sup>

Thus, the conditions for the possibility of reascent to the noetic exist for the embodied soul and her vehicle. The rational soul and vehicle are immortal and can attain union with their creator. This will be discussed momentarily.

The reasons for the soul's descent again are familiar. For Proclus there is no part of the soul that does not descend. Descent is necessary but the soul may assent and descend or resist and be forced to descend. Assentive souls make a pure descent; dissident souls an impure descent. Pure souls are impassionate, sinless, and benefit the terrestrial realm; impure souls are passionate, sinful, and wreck havoc in the earthly world.<sup>116</sup>

Unlike the impure soul, the pure soul maintains a connection to the noetic realm while embodied. Purified of all stains and sin this soul serve a religious-theurgic purpose. This soul is the one which invokes the gods and makes it possible for purified souls to encounter the holy and begin an ascent through the heavenly spheres to their leader gods and eventually their maker—the hypercosmic demiurge.<sup>117</sup>

For Proclus a strict metaphysical hierarchy exists in which the noetic gods and the good beyond them are accessible to humans only through the intervention of heroes, daemons, and the visible gods.<sup>118</sup> Nonetheless, from purified human souls to the visible gods and beyond to the hypercosmic deities and the demiurge there is one continuity, one chain of being that links embodied souls with their source.

This means each human soul is allotted a leader god to which it is connected by a series of higher entities—pure souls, heroes, and daemons.<sup>119</sup> The soul's salvation depends on these intermediary entities which can be reached only through theurgy.

From the doctrine of the soul's increasing materiality in descent, the vehicle of the soul (*ochema*) obtains its theurgic function.<sup>120</sup> Once the vehicle of the soul is purified the soul to be able to imagine those symbols and rites presented to her by the gods. This occurs when an individual is initiated into the divine mysteries of theurgy.

Although the immortal vehicle is tied up with the irrational soul it is capable of an existence apart from it.<sup>121</sup> The vehicle's ultimate goal is to be reunited with the ethereal vehicle of the visible god, the soul's leader god. There the vehicle and the irrational soul remain, purified, and perhaps, the rational soul ascends even higher to the noetic realm.

Once initiated and consecrated the vehicle of the soul can be filled with divine images. They prevent any material images or sense-impressions from occurring within the vehicle, thereby blocking out any irrational activities. The rational soul can now operate on the noetic level.

Whenever the partial (i.e., human) soul attaches itself to the whole (i.e., the divine soul), its vehicle also follows the vehicle of the divine soul, and just as the soul imitates the intellection of the divine soul, so also its body imitates the movement of the divine body.<sup>122</sup>

Indeed the vehicle is purified and elevated by the divine light from the soul's leader god. Thus its function is to be illuminated. This occurs through initiation.

### E. Aesthetic Symbols and the Arts

Proclus, therefore, set out three degrees of initiation: initiation (*telete*); consecration (*myesis*); and vision (*epopteia*).<sup>123</sup> Telestic and consecrative initiation constitute the purifying stages for the vehicle.

Marinus reports that Proclus was initiated into the Mysteries of the Great Nestorius by Asclepigeneia, the daughter of the theurgist and thaumaturge Plutarchus, son of Nestorius.<sup>124</sup> Having studied his teacher Syrianus and:

...the many works of Porphyry and Iamblichus and the writings of the Chaldaeans which belong to the same order of ideas and thus, nourished by divine oracles, he rose to the highest level of the... theurgical virtues.<sup>125</sup>

For the philosopher the last initiation, vision, is a liberation of the soul effected by the gods that brings things together. It is to this image we turn. What does this vision (*epopteia*) bring with it? This question brings us back to the symbolics of this essay. We return to the immortal symbol of Hecate's thighs:

About the cavity of the right hip poured forth an abundance of pienteous liquid of the first generated soul, who entirely ensouls the light, the fire, the aether, and the worlds. In Hecate's left hip exists the source of virtue, which remains wholly within and does not give away its virginity.<sup>126</sup>

Since the goddess ensouls the sublunary world her hips symbolize the cosmic orders dominated by her. The right flank represents the potency of this cosmic soul. She is a power who ensouls the totality of the physical cosmos—its elements of light, fire, aether, and worlds. These correlate to *Aion*, the Father begotten light; *Pyr*, the Empyrian realm, *Aether*, the region of the fixed stars, and *Kosmoi*, the zone of the planets and the terrestrial world.

The orifice on Hecate's left hip does not discharge any water for it symbolizes the source of virtue. The goddess is unwilling to imperil its purity by contact with the sublunary world. Accordingly her remains within Hecate and is accessible to those souls capable of rising to the intramundane realm where the goddess resides.

To acquire these powers and the virginal virtue associated with them the soul must approach her left thigh. Although Hecate is unwilling to reveal them on a terrestrial level, she will willingly reveal her charms to those souls who ascend to the aethereal realm. This, however, requires an ascent of the soul to the moon, to Hecate.

For Proclus, art functions as an instrument of the divine intellect. It triggers and actuates the rational soul and her vehicle. Indeed, when Hecate self-manifests in her statue in an apparition perceptible to the imagination human and divine souls and vehicles move in consort together. When the human elements grasp the activity of the divine elements they turn outward to receive the deity and discover their eternal link with the divine. *Aisthesis* is an *antilepsis*, a coming to consciousness of a higher self, and a divine source. For Proclus this is only possible through aesthetics and the symbolics of the hieratic art.

### III Rationality, Ritual, and Culture

#### A. Aesthetic Pattern as Culture Pattern

For ancient Mediterranean men and women the pilgrimage of the soul to intellect and to deity is cast in terms of divine giving.<sup>127</sup> Later Roman men and women treasured the arts and aesthetic perception. The arts transmuted psychological and ontological distance into the deep joy of proximity to self and to the gods. Aesthetics contributed to a network of interpersonal acts that carried the full over-tones of the later Roman cultural traits of love, power, sympathy, patronage and salvation.<sup>128</sup> Perception and the arts functioned as one of the cements of their social world.

#### B. Later Platonic Symbols and Roman Culture

The remains of this aesthetic pattern pullulate through the writings of later Platonism. Its instantiation lay in the *Truimmerfeld* of temple sites and statuary that ring the Mediterranean basin. To the ancient eye these surfaces and solids reveal images of an ideal world of symmetry, harmony, and beauty for an intelligible beauty could be grasped through the narrow apertures of its temples and the formal qualities of its statues. Architecture and statuary present images of ideal being vivified. Masonry and marble symbolize needs satisfied and long distances overcome.

What does an ancient theory formation tell us about an ancient aesthetic pattern? An elusive question to ask, let alone answer. Plotinus has suggested that beauty manifested itself to the Roman in buildings dedicated to the gods; that the beautiful shimmered in the statues formed to their images. Perhaps by localizing intelligible beauty in art these Romans recognized the presence of the divine in the visible, fed on the joys of its proximity, and thereby tempered their fears of distance from self and from their gods.

The human craftsman like the cosmic demurge fashions a world. Artistic creation makes one aware of the attainability in the visible world of an intellectual beauty whose abode is the intelligible world. Distance is overcome, the beautiful is proximate in temple and statue. The visible

fact of the beautiful points to the instantiation of the eternal in the temporal, the formal in the material.

*Hic locus est*—is the refrain that runs through these monuments of a lost age. The intelligible is accessible aesthetically. Through art the lower self communes with the forms, gains union with the higher self, and eventually with the beautiful. For in temples and statuary beauty dwells. Temples are theomorphic sanctuaries; statuary theomorphic beings. Loci for gods and goddesses they become a focus for the image-making faculty of the soul, even perhaps, places where one's daemon appears.

Clearly temples are places where souls meet *daemons* and gods. Porphyry tells how Amelius visited temples at the New Moon and the Feasts of the Gods happily offering sacrifices (*philothutes*).<sup>129</sup> He asked Plotinus to come along. The master answered: "They ought to come to me not I to them". His refusal to accompany Amelius probably means he did not expect to find any of the higher gods waiting for him in their temples, only lower gods or daemons. Thus, he refused to go. This does not mean, however, that Plotinus thought temples devoid of higher beings.

Porphyry reports that Plotinus encountered a god at an *Isis* temple in Rome.<sup>130</sup> The spirit was summoned (*kletheis*) to appear (*eis autophian*). The deity visually appears and the philosopher assesses it through his faculty of sense perception (*aisthesis*). Statues also are vehicles for the manifestation of the image of the form of beauty.<sup>131</sup> Plotinus claims that the perception of the form of beauty instantiated in the statue leads the mind to an understanding of intelligible beauty and, perhaps, to the beautiful (*he kallone*).<sup>132</sup> Since the beautiful is divine, statuary clearly are concrete manifestations (*algamata*) of divine beauty itself.<sup>133</sup>

Thus Plotinus assumes the physical presence of the divine and the beautiful in architecture and statuary. Their beauty and symmetry guarantee the presence of divinity and beauty in their midst. Most significantly, however, he maintains an aesthetic theory that makes their presence in art meaningful. The philosopher was, after all, a mind that grasped these divine and formal images; a soul aware of its undescended self; a figure who knew the intelligible world of the forms; and even succeeded in rising to the highest god four times.<sup>134</sup>

By the fourth century the strictly noetic way of access to the intelligible world, tied to the presence of the ideal world in the act of

intellection, had come to be irreversibly modified in Platonism.<sup>135</sup> Indeed an aesthetic way opened up, legitimized by an axiological shift in the value of perception and imagination, and heralded by the Neoplatonic view of the instantiation of the divine forms in statues and icons, temples and churches.

The great building projects of Constantine and the rededication of temples by Julian reflect this new awareness.<sup>136</sup> A sense of divine grace lies at the root of the building, making, and translation of art objects by the Roman upper class.<sup>137</sup>

As members of an inherited elite Neoplatonists were in a strong position to encourage the translation of the arts, to appropriate and give the stamp of legitimacy to these channels of the holy. For their theories of knowledge, the soul, and reality rendered intelligible the constant presence of the divine in nature and within art.

In the demi-monde of Hellenic Neoplatonism the dark mood cast over the soul due to her fall and separation from the intelligible world was ameliorated aesthetically.<sup>138</sup> For art served as a visible gesture of divine access to the unconscious and descended soul. Aesthetic knowledge and theurgic practice represented a replication of interpersonal relations between humanity and divinity thought lost because of the tragic nature and destiny of the soul.<sup>139</sup>

The ceremony that surrounds the arts in later Platonism, thus, guarantees good happenings in a world cluttered by bad ones. Theurgic rites represent a carefully articulated model of the new aesthetic relationship between humanity and divinity. Art symbolized for the Neoplatonist contact with ancient gods and goddesses, aesthetic knowledge and theurgic action solidarity with their own empire-wide class.

By the fifth century the philosopher and theurgist are indistinguishable.<sup>140</sup> As the knower of divine wisdom and the doer of the hieratic arts, this figure becomes a supernatural extension of divine power (*dynamis*) and love (*eros*) in the universe. Thriving on the tenacious bond of aesthetic friendship (*philia*) their knowledge and activity offered a mantle of divine patronage (*prostataia*) and the possibility of divine salvation (*sotereia*) to all who fell within their orbit. Indeed, the philosophers use and transfer of divine power to their clients rendered accessible the proprietary relationship with the gods thought lost because of the fall of the soul.<sup>141</sup>

### C. The Philosopher as Cultural Symbol

Mortals are not immediately joined to the gods but require greater kinds of intermediaries ranging from the cosmic gods and their angels to heroes and sages. Philostratus, Damascius, Marinus, Eunapius, Sozomen, and Zosimus present the lives of wise men and women who effectively brokered this patron-client relationship.

Asclepiodorus and Heraiscus spent long periods of their lives in temples, Damascius resided in a cave under a temple devoted to Cybele near Hierapolis.<sup>142</sup> Each communed with the gods and goddesses who appeared at such places. Venturing forth they became privileged agents and administrators of divine power, love, patronage, and salvation to a wider Roman world.

Hypatia of Alexandria and Sosipatra of Pergamon were higher souls protected and guided by blessed daemons and heroes.<sup>143</sup> Not only philosophers of high repute—Hypatia was the teacher of Synesius and the author of a famous treatise on numbers and Sosipatra was the instructor of countless students and wrote commentaries on the dialogues of Plato—they were practicing theurgists. Using a statue Hypatia telestically cured a man who fell in love with her while Sosipatra victim of a love-spell cast on her by Philometer had it reversed by Maximus, the pupil of Aedesius and teacher of the Emperor Julian.<sup>144</sup> Other women like Asclepigenia and Anthusa of Cilicia joined men like Plutarch and Hermias to contact, fathom, and translate the divine presence and hallowing in statues to aristocratic clients in city, town, and country throughout the Empire.<sup>145</sup> The inverted magnitudes of temples and statues resided in their souls. Consequently they were able to bring to seance and seminar their condensed solidarity with the divine world.

This map of divine love and power correlates with another symbolized by divine patronage and salvation. Both coalesce around Neoplatonic aesthetic patterns and later Roman cultural patterns. It is easy to be misled by the heritable traits of later Platonic aesthetics and Roman culture.<sup>146</sup>

So often presented as expressions of those who somnambulated in a utopian world many have lost view that this coalescence of aesthetic pattern and culture pattern functioned to enlist and register the participation of listeners (*akroates*) in the manifestation (*autophania*) of the gods in the physical world.<sup>147</sup>

Since matter is not evil it does not prevent communication with the gods. The statue of a god is a material object and matter (*hylē*) is offered (*didomai*) by the gods. Thus, it is congenial (*symphyēs*) to them.<sup>148</sup> Thus to make and consecrate statues to the gods is the aesthetic way of communing with the divine:

Create a statue, purified in the manner I shall teach you. Make the body of mountain rue (*pegannon agrion*)<sup>149</sup> and adorn it with little animals, with domestic lizards, and when you have crushed a mixture of myrrh, gum (*stirax*), and frankincense, blend it with these creatures, go out to the open air under a waxing moon and perform the rite by saying the prayer...<sup>150</sup>

Porphyry says:

You consecrate a statue of Hecate in the following way: Produce a certain kind of fillet; grind lizards together with fragrant essences and burn all that; say a certain prayer in the open air under a waxing moon; do all this to consecrate the statue of Hecate. The she will appear to you in your sleep.<sup>151</sup>

Buildings and statues, herbs and stones, incantations and formulas, gestures and dancing were included in the categories of symbols (*symbola*) and tokens (*synthemata*) that established contact between a human being and a god. Tools like the bull-roarer (*rombos-stromphalos*)<sup>152</sup>. Marinus reports that Proclus used the rhombos wheel to communicate with the gods.<sup>153</sup> Syllabic utterances (*voces mysticae*) were also employed to render the gods visible.<sup>154</sup>

A divine light (*autophia*) often appeared with the manifestation (*autophania*) of the deity. Sometimes the mediator, the philosopher-theurgist, would radiate divine light.<sup>155</sup> While lecturing Proclus would project such light for he communicated with luminous apparitions of Hecate and saw the goddess herself.<sup>156</sup> Not only gods appear; a parousia of nature appears, preceded by a whole choir of daemons, angels, and spirits. They are gracious, kind, and give beneficence to the person who evoked them as well to those whom the theurgist initiates into their mysteries.<sup>157</sup>

Through symbols and tokens the god would recognize the theurgist as a legitimate practitioner, and the theurgist the god as a real god.<sup>158</sup> Scattered throughout the universe through the kindness of the

gods they work without our knowledge<sup>159</sup> but they are known to the higher soul. Known to them they were used to achieve union with the gods.<sup>160</sup> Spoken or unspeakable, concealed within the statues of the gods, they assure the presence and intervention of the gods known only to the *telestai*.<sup>161</sup>

A sacred fire that shines without shape speaks to the theurgist.<sup>162</sup>

For your sake, bodies have been attached to our autophanies (*autoptois*; *phasmasin*).<sup>163</sup>

The theurgist becomes a medium (*docheus*) for the presence of the divine in the world.<sup>164</sup> Eunapius reports that Maximus assembled a large number of friends in the temple of Hecate and burned a grain of incense, reciting to himself the text of a hymn. The goddesses smiled, then laughed, and finally the torches she held burst into flames, into a blaze of light.<sup>165</sup> Wise men and women, therefore, brought a divine presence into the world and the divine power embraced their human community, reintegrating each human soul with her divine source.

Buildings, statues, natural objects, and language became the visible companions that crowded around the men and women of late antiquity. Pullulating with divine expressions of access and friendship they explain the ancient map of relations between deity and humanity in the age of the later Caesars. Neoplatonists were convinced that gods, goddesses, daemons, and angels revealed their natures and names through those special men and women whose primordial sowing linked them eternally with the divine. Aesthetic perception and the arts enabled the imagination to project a structure of a clearly defined reality onto a known social world and to define personal relationships.

#### D. Aesthetic Symbol as Cultural Symbol

Art, in late antiquity therefore, did more than decorate a landscape with imposing temples and sublime statues. It was an expression of piety exquisitely adapted to enable ancient Mediterranean men and women to articulate and render intelligible urgent questions on the nature and destiny of the soul. Art revealed the continuity between the self and the divine, serving to establish a sense of the stability of the identity. It permits the soul to turn her back on the towering disparity between the different orders of the universe and to seek reassurance in the tight web

of her imagination, in the stability of the well-known human relationships of patron and client.

Against this immemorial backdrop, later Romans turned to discover their divine, unconscious selves. Objects of art provided the soul with recognizable forms of divine beings whose self-presentations were rendered aesthetically intelligible through theurgy.

Neoplatonic aesthetics makes clear the metaphysical structure of patronage and the solidarities that bound together the aristocratic classes of the Roman Empire, in these last pagan centuries. Aesthetic theory established the presence of divine love and power in the world, their accessibility, and, therefore, consolidated the Platonic philosopher at the acme of a divinely sanctioned patrocium.

Thus, art, becomes part of a universe increasingly marked by implicit and explicit patronage. The divine has its network; holy men and women tapped into it by building patronage networks of their own. As a result the theurgist was placed at the forefront of later Roman society as the fulcrum of a wide-ranging social patrocium. As patrons divine men and women emerged to resolve the gulf between self and deity through an aesthetic therapy of proximity. The theurgist emerges as the leader of a *patrona communis* who sees the different levels of the self and the manifold levels between the self and god and resolves them. The aesthetic pilgrimage of the soul to intellect and beyond overcomes distance and alienation. Integral to this Odyssey of the soul is the detachment of the arts from a mimetic context and its attachment to a hypostatic context. Through art the divine communes with the human. Moreover it becomes a locus of a network of "interpersonal acts" between gods and humans that carries with it the full overtones of later Platonic epistemological, psychological, and reality theories as well as later Roman understandings of generosity, inter-dependence, and solidarity.

With Plotinus' concession, Platonic aesthetics at last comes to terms with the cultural world of the later Roman Empire. As Plotinus insisted, the absolute certainty characteristic of the intelligible world manifests itself in the sensible world. The world of ideas is self-contained, cogent, and certain. It is accessible because the natural world is deliberately fashioned so that our minds can move freely and confidently within it to capture the divine essence that creates and sustains it.

Everything in the natural world may be in flux, while certainty belongs to the intelligible world. Nonetheless, Plotinus, Porphyry, Iamblichus, and Proclus postulate a fixed framework within nature as a necessary mark of its rationality. The arts provide access into a clearly defined structure of reality within which everything and everyone has a lucidly defined relationship.

Earlier Platonic assumptions, that only a fixed order of being could be intelligible, are proved groundless. The divine order is aesthetically intelligible. In Neoplatonic terms, we understand the world not less, but more completely through nature and the arts. We also understand interpersonal relationships in a new way. Later Romans drew intellectual strength from these facts.

For these ancient Mediterranean men and women Hecate beckons:

Bats are now beginning their short strutting flights against the sky. In the east the color is washing out the world, leaving room for the great copper-colored moon which will soon rise over Epirus. It is the magic hour between two unrealized states of being—the day-world expiring in its last hot tones of amber and lemon, and the night-world gathering with its ink-blue shadows and silver moonlight.

'Watch for her,' says the Count, 'behind the mountains there.' The air tastes faintly of damp. 'She will be rising in a few moments.'

'I am thinking,' says Zarian, 'how nothing is ever solved finally. In every age, from every angle, we are facing the same set of natural phenomena, moonlight, death, religion, laughter, fear. We make idolatrous attempts to enclose them in a conceptual frame. And all the time they change under our very noses.'

'To admit that,' says the Count oracularly, 'is to admit happiness—or peace of mind, if you like. Never to imagine that any of these generalizations we make about gods or men is valid, but to cherish them because they carry in them the fallibility of our own minds.'

## Conclusion

Plotinus, Porphyry, Iamblichus, Proclus: the list would probably have puzzled my grandfather and his generation. It makes sense now; it symbolizes changes in our historical perspective. We can face, more or

less from the same angle, thought communities which seem far apart; and we can find something in common among them through the rationality and the rituals of the social organizations that produced such facts.

For the most part these men did not know one another. No obvious external link connects most of them with each other. Yet all of them gave new meanings to prophecy, divination, and magic in later Platonism, and brought about profound changes in the societies to which they belonged.

We have been led to ask the philosophical and cultural questions that will interpret the teachings of the later Platonists in order to make them more socially perceptible. We have asked what conditioned the appearance of so many kindred understandings of prophecy, knowledge, reality, and the soul within relatively wide chronological limits. We have inquired how indeed were prophecy, divination, and magic interpreted in so many different ways within relatively narrow cultural limits. We have examined why there is a relation between the religious and philosophical ideas of later Platonism and the social messages these thought communities conveyed.

The very nature of the questions that have come to our minds indicates the essence of our new position towards these men and women. Instead of seeing each later Platonist as representatives of specific religions and schools, we now see all of them as participants in a general cultural system. They have explained themselves to us directly by their own words. We have done our part by commenting on their words. Given the necessary knowledge of languages and texts, we may presume that at some future date we shall understand Porphyry and Proclus in the same way as we comprehend Philo and Origen.

Until then firm conclusions about the relation between individual minds and social institutions can be drawn only when all the evidence has been collected and analyzed. Nonetheless, it is possible, even now, to make a few preliminary observations about prophecy, divination, and magic in Later Platonism and their relation to social facts.

A. Later Platonists established a connection between rationality and ritual. This linkage underscores the ontological, epistemological, psychological, ethical, and soteriological significance of occult knowledge and practices.

B. Later Platonists utilize the pneumatic/noetic link between oracular and scientific knowledge to resolve a series of ontological and psychological problematic endemic to their degree of reality metaphysics and the fall of the soul. This is clear from the extensive use later Platonists make of the technical terminology of ontology, epistemology, and psychology. This permits later Platonists to lift ritual out of the *arcana mundi* to which it was consigned.

C. Later Platonic understandings of rationality and ritual suggest a relationship between individual minds and social institutions. This association resolves itself in four main points:

- Later Platonic cognitive processes reflect later ancient social arrangements. This is largely clear in the relationship between later ancient metaphysical theory and later Roman patronage and kinship systems. Knowledge reflects and builds social solidarity.
- The proposition that philosophical facts are social facts suggests that knowledge is essentially social. Key activities of thinking such as the conferring of identity, the positing of similarity relationships, and the classification of divine and natural kinds are shaped by the cultural and institutional contexts in which they occur.
- Later Platonic knowledge processes and practices underpin institutions. Thought communities are social institutions. The fact-generating activity of later Platonism and later ancient cultural complexes get shaped together. To constitute a version of reality is at the same time to constitute a society.
- The thesis that knowledge acquisition and sharing shows how institutions and knowledge get shaped together effectively limits those who are committed to rational choice theory and its assumption that individuals act as autonomous rational calculators. Rational choice theory cannot fully explain the relationships between metaphysical thinking and the social arrangements it reflects. The difficulty lies in rational choice theory's neglect of the prior problem of how knowledge systems come into being.

To view later Platonic rationality and ritual from these perspectives is to connect them with their proper contextual worlds and to explain how ritual was legitimized rationally and socially. If this study has shed light on the relationship between knowledge and society and

stimulates others to investigate these connections further, it will have more than fulfilled its purpose.

## Endnotes

1. Especially, E.R. Dodds, "Theurgy," in *The Greeks and the Irrational*, Berkeley, CA: University of California Press, 1951, pp. 283-311. cf. Pierre Boyance, "Theurgie et telestique neoplatonicienne," *RSR* 47 (1955), pp. 189ff.; Samson Eitrem, "La Theurgie chez Neoplatoniciens et dans les papyrus magiques," *Symbolae Osloenses* 22 (1942), pp. 22f.
2. See, Georg Luck, "Theurgy and Forms of Worship in Neoplatonism," *Religion, Science, and Magic In Concert and in Conflict*, New York, NY: Oxford University Press, 1989, pp. 185-228.
3. Fredrick Suppe, *The Structure of Scientific Theories*, Urbana: University of Illinois Press, 1977, p. 17.
4. In this sense the model of rationality used by Dodds is implicitly logical positivist. This model for theoretical explanations is elaborated on and critiqued by Carnap, Hempel, Nagel, and Braithwaite.
5. See, Hans H. Penner, "Rationality and Religion: Problems in the Comparison of Modes of Thought," *Journal of the American Academy of Religion* LIV 4 (1986), pp. 646-671.
6. Such as those of E.R. Dodds. cf. e.g., *The Greeks and the Irrational*, Berkeley, CA: University of California Press, 1951, pp. 283-311.
7. On the question of rationality, ritual, and science. cf. Hans H. Penner, "Rationality, Ritual, and Science," *Religion, Science, and Magic In Concert and In Conflict*, New York, NY: Oxford University Press, 1989, pp. 11-24.
8. This definition received its classical sociological analysis in the works of Max Weber. For more recent definitions. cf. Steven Lukes, *Essays in Social Theory*, London: Macmillan, 1977, p. 54; Maurice Godelier, *Rationality and Irrationality in Economics*, New York, NY: New Left Books, 1972, p. 12.

*Old Dominion University  
Norfolk, Virginia*

All of the papers in this volume were presented or prepared for presentation at an international conference on "Neoplatonism and Indian Thought" held at Brock University, St. Catharines, Ontario, Canada in October, 1976. The conference was sponsored jointly by the International Society for Neoplatonic Studies and Brock University, and was largely the product of the efforts of Professor John R. A. Mayer of Brock University, who arranged primary funding through the Canada Council, served as co chairman of the planning committee, and handled all local arrangements. President Alan Earp of Brock University also gave the project his full moral and financial support. Some one hundred scholars, representing eight nations, participated in the sessions and the conference was judged to be a success by its planners, sponsors, and participants. It stimulated interest in the study of Neoplatonism, a major objective of I. S. N. S., and it continued the long-standing involvement in comparative studies of Brock's philosophy department.

The conference itself, being the first ever held in any country on the subject, was a pioneering venture. Relatively

few books and articles comparing the two intellectual traditions have been written. Although a few first rate specialized studies, such as Émile Bréhier's chapter on "L'orientalisme de Plotin" in his *La philosophie de Plotin* (Paris, 1928) and J. F. Staal's *Advaita and Neoplatonism* (Madras, 1961) are available, no major work dealing with the conference theme in a comprehensive way has yet been produced. Faced with the fact of the scarcity of scholars who are experts in both Neoplatonism and Indian thought, the planning committee decided to have a conference that would allow for an interchange of ideas between specialists in Neoplatonism and specialists in Indian thought. The end result was that most of the papers accepted for the conference were written by experts in the one who were willing to explore some aspect of its connection with the other, and mainly by Western philosophers and classicists willing to investigate Indian thought and Indian philosophers and Western Indologists willing to investigate Neoplatonism. Discussions after the papers were exceptionally lively, and most participants agreed that the sessions were a challenging and creative experience.

Two specific objectives were predominant in the minds of the conference planners. The first and primary one was a careful consideration of certain concepts and assertions that appear to be common to both philosophical traditions. Most of the conference papers relate to this objective. The second and lesser one was an investigation of the possible historical influence of Indian sources upon late Greek philosophy, and specifically upon the Alexandrine Platonists. Although it was our intention to consider all aspects of Indian thought, most of the papers refer only to Hinduism. The conference gave only minor consideration to Indian Buddhism and the Islamic Indian tradition and no consideration to numerous lesser Indian traditions.

The papers in this volume are presented for what they are, namely, the papers of a conference designed as a serious, but preliminary investigation of the topic. They do not provide an adequate, balanced, or definitive treatment of the subject, an

achievement that must await considerable further investigation and reflection that hopefully will yet be done in India, Japan, the United States, Canada, and Europe. They vary in their degree of scholarship and level of understanding of the various intellectual traditions, as might be expected. They are, nevertheless, generally quite provocative and informative. They should be particularly useful to those students who have a limited knowledge of either Neoplatonism or the various Indian traditions and who would benefit from a selective reading of essays which present them on various levels of sophistication.

It is the hope of the editor that this volume will succeed in stimulating further interest in the study of the affinities of Neoplatonism and Indian thought and will lead to additional scholarly research on the subject both in the East and in the West.

## Acknowledgements

---

The editor wishes to indicate his special appreciation for the various individuals who have assisted in the production of this volume. Dr. Heinz K. Meier, Dean of the School of Arts and Letters, and Dr. Warren Matthews, Chairman of the Department of Philosophy of Old Dominion University have provided both moral and financial support. They were especially helpful in providing funding for the preparation of the manuscripts and camera-ready copy. Gladys Blair, Penny Haws and Sue Massie served as research assistants in editing the original manuscripts, and Joseph Winfield did much of the typesetting. Final editing, production of camera-ready copy, design of the book, and layout are the work of Tom Rich. Professor Woodrow W. Moore, of Old Dominion University's Foreign Language and Literature Department, generously translated Professor Bazan's lengthy article from Spanish into English.

## Introduction

---

John R. A. Mayer

*Brock University  
St. Catharines, Ontario*

While the present volume is an edited record of the proceedings of the Second International Congress of the International Society for Neoplatonic Studies held at Brock University in St. Catharines, Ontario in October, 1976, it is also much more than that. The Congress had for its theme *Neoplatonism and Indian Thought*, and this for very good reasons.

Firstly, it is the view of the organizers of the meeting that comparative philosophy is a field of study to which far less attention has been devoted than it warrants. Philosophical development can be understood not merely as innovation, the invention of new and heretofore unthought of systems, methods and views, but also as recovery of that wisdom from the past whose significance has become lost, occluded from view, due perhaps largely to the gradual transformation of the meaning of key terms in the language in which it was transmitted.

Secondly, throughout intellectual history there has been an interplay between the unitive vision which has provided a harmonization of contrasts, revealing the disparate and seemingly

disjointed aspects of experience as grounded in a common matrix, and the analytic scrutiny which searches out contrasts, criticizes, defines and dissects. The contemporary world is largely fascinated with this latter act, while the Neoplatonic tradition invites the contemplative development of the former state. It is clear that the Neoplatonist understands his tradition as a healing alternative to the fragmented dualisms, pluralisms, apperceptions of the world as chaos, disorder and randomness. This volume, then, is not merely a scholarly report, although it is that, too, but an occasion to draw attention to an often ignored but important tradition.

To quote Simone Weil:

It seems that Europe requires genuine contacts with the East in order to remain spiritually alive. It is also true that there is something in Europe which opposes the Oriental spirit, something specifically Western, . . . and we are in danger of being devoured by it. . . .

European civilization is a combination of the Oriental spirit with its opposite, and in that combination there needs to be a high proportion of the former. This proportion is today not nearly high enough. We need an injection of the Oriental spirit.<sup>1</sup>

This book, then, also proposes to be ■ partial response to the above call.

Neoplatonists today can be divided into two groups, with a number of individuals who fit both categories. On the one hand we have the scholars of the tradition, people interested in the reconstruction and interpretation of the texts of ancients, such as Plotinus or Proclus, or of more recent Neoplatonic authors. On the other, there are those who recognize the perennial value, and hence modern-day relevance, of a monistic, non-materialistic, mystically inspired, but intelligently developed and cogently presented system of thought. They yearn to express such a worldview engagingly so as to

bring to a world dominated by materialistic, pluralistic, relativistic and nihilistic philosophies the challenge and inspiration of an entirely differently textured approach to the nature and meaning of experience—both mundane and contemplative. Most contemporary thinkers are firmly rooted in their conviction of the ontological and metaphysical primacy of the empirical, sensory and common-sense domain. Life, consciousness, and world-process are understood as composed consequences of insensate ingredients. To this Neoplatonists counterpose the image of a Source, from Whose transcendent integral center all lesser and determinate forms of being emanate. Of course there are individual variations and differences in just how such adumbrations are presented by different individual authors. But it is the concern of the second group to develop interest in this tradition in order to evoke by means of new and felicitous formulations the recovery and re-living of the existential basis of the insights of the ancient sages.

It is salutary to discover that the non-dual tradition has had a flowering not only in the 4th and 5th centuries of Western thought, but has had remarkable expression and influence on the culture and civilization of India. While the probability of occasional cross-fertilization of ideas cannot be ruled out, it is nonetheless safe to say that Eastern and Western scholars, sages and seers developed similar philosophies and claims largely in isolation one from the other. Their frequently identical metaphors and similes, therefore, confirm the parallel character of their traditions.

The general intellectual climate is not sympathetic today to the Neoplatonic tradition. And yet, one can find evidence for the persistency and appeal of the tradition in our own days. Apart from scholars, Aldous Huxley and Christopher Isherwood could be named as influential literary masters committed to this heritage, as well as the countless young people, who seek to give content and meaning to their lives by understanding its objective as the reunion of the separated

individual with his original source, by means of devotion, purification and compassion.

Thus, this volume is presented not merely to the world of scholars, but to the serious layman, to whom it can provide in addition to information about the past, glimpses of that future in which educated men and women will consider as their own not only the narrow confines of the mainstream of their immediate culture, however productive, but rather, the breadth of the adventures of the human spirit, throughout history.

The present introduction did not enumerate and comment on the individual contributions of this volume, since that task is ably done by Dr. I. C. Sharma, in the concluding, summarizing essay. For those readers who may wish to have a guide toward a selective reading of this volume, we recommend turning to it first.<sup>2</sup>

*In fine*, the organizers of the Congress, the officers of the International Society for Neoplatonic Studies, and the contributors to this volume wish to express their gratitude for the support of those agencies and institutions without which neither the Congress nor this volume would have been possible. Notably, the Canada Council, the Universities' Grants Commission of India, Brock University and Old Dominion University should be specified, although many other Universities assisted by enabling their faculty to participate.

## Indian Wisdom and Porphyry's Search for a Universal Way

John J. O'Meara

*University College Dublin  
Dublin, Ireland*

Porphyry, the disciple of Plotinus to whom we are indebted for the *Enneads*, the record of his master's teaching, flourished towards the end of the third century A.D. It was a time when men were concerned with the notion of 'salvation'<sup>1</sup> and were particularly anxious to discover some 'saviour', some mediator between God and man, who would be the vehicle by which mankind as a whole might be saved. 'Salvation' had, of course, different meanings for different groups, as indeed had 'god' and 'mediator'. Christianity pointed to Christ as *the* Mediator, God become man, *the* way.

Porphyry rejected the claims made on behalf of Christ and so attracted the attention of Saint Augustine, who was born some fifty years after Porphyry's death. Augustine discusses the matter towards the end of the tenth book of his *City of God* and in doing so quotes passages from a work of Porphyry in which he deals with the return of the soul. It is from one of these quotations that I take my text:

When Porphyry says . . . that no single sect had been found that contained a universal way for the libera-

tion of the soul, deriving from some true philosophy, or the *mores* and *disciplina* of the Indi, or the 'ascent' of the Chaldaeans, or any other way, and that this way had not as yet come to his notice through historical knowledge, he without any doubt admits that some such way exists."<sup>2</sup>

Augustine further asserts that Porphyry held firmly that Providence could not fail to provide such a single universal way for the soul's liberation: for Porphyry it was merely a matter of finding and identifying it.

It is clear from the context in Augustine (whose claims to be a Latin-writing Neoplatonist are variously, but must be seriously, considered) that the liberation of the soul that is in question is its liberation from the cycle of existences as understood by Plato and Plotinus. While these, according to Augustine, accepted that a man might be re-born as an animal, Porphyry demurred: he would allow only that a man might be re-born as man.<sup>3</sup> He held also that the soul could escape altogether from the cycle. "God gave the soul to the world so that when it got to know the evils of matter it would run back to the Father and at length not be held by the polluted contagion of such things."<sup>4</sup> Escape for the individual soul, according to Augustine's report of Porphyry's views, became permanent and absolute when it was cleansed of all evils: it would then be established with the Father and would never again suffer the evils of this world.

The problem did not arise with the individual who might follow the way of philosophy. But only a few were capable of this: some universal way by which the souls of the masses might be freed from the cycle must, Porphyry held, be provided by ■ providence which took such tender care of things of so much less importance.

Having dismissed philosophy, including his own Neoplatonism, as a universal way of salvation Porphyry looked for such a way to the "*mores* and *disciplina* of the Indi," the ascent of the Chaldaeans, and other such systems. His *Letter to Anebo*,

an Egyptian priest, a passage from which is quoted earlier in the tenth book of Augustine's *City of God*,<sup>5</sup> is evidence that among such other systems was the Egyptian, and that in it Porphyry was disappointed.

The 'ascent' of the Chaldaeans requires just a little more notice here, if only because so much attention is given by Augustine throughout the *City of God* to Porphyry's ambivalent attitude to the Chaldaean oracles.<sup>6</sup> These oracles, according to Porphyry, claimed that demons could purge and cleanse the spiritual or pneumatic soul—but not the real, the intellectual soul:

You [Porphyry], being a philosopher, we must assume, can see that for you no such rite of cleansing by theurgic art is necessary in the least. Yet for all that you bring in such rites for the benefit of others. . . . you do it by decoying those who are incapable of becoming philosophers into practices that you admit are of no value to you, who are capable of higher things. Evidently you want all who are turned away from the pursuit of philosophic excellence, which is too lofty for all but a few, to seek out theurgists on your recommendation, in order to obtain catharsis at least of their spiritual, though not, to be sure, of their intellectual soul. And since the number of those who have no stomach for philosophy is incomparably the greater, more are forced to resort to your clandestine and illegal teachers than to the Platonic schools.<sup>7</sup>

Porphyry, then, did not find the universal way of salvation in that minor "ascent" of the pneumatic soul only, which was operated by demons in return for sacrifices made to them and which was commended by the Chaldaean oracles.

Augustine further reports that Porphyry held it as certain that only the Principles, the *principia*, that is, in Neoplatonic terms, the Father (the One) and the Father's Nous (Πατρικὸς νοῦς) could cleanse souls so that they could escape rebirth and abide forever with the Father.<sup>8</sup>

One must emphasize that Porphyry's discussion of all mankind's escape from rebirth is put in a context by Augustine which centres on the characteristically Roman pre-occupation with *vita beata*. The first five books of the *City of God* refutes the claim that happiness in *this* life is ensured by the worship of many gods. The next five books, of which the tenth (with which we are most concerned here) is the last, refutes the claim, represented, Augustine says, mainly by Platonists, that *happiness in the life after death* is ensured by the worship of many gods. Escape from the cycle of existences is essential—since, where there is any possibility of a return to body, happiness cannot be complete and eternal. The nerve, therefore, of Porphyry's enquiry, as represented by Augustine, is escape from *palingenesis*.

When Porphyry then, according to Augustine, in looking for a universal way of salvation, turned to the *mores ac disciplina Indorum*, he had abandoned the hope of finding it in any system of true philosophy—with emphasis on philosophy as experienced by himself. He was turning to something that was not *exclusively* philosophical. The "ascent" of the Chaldaeans was the second such system he specified. The first, however, was the *mores ac disciplina Indorum*. According to the context, what Porphyry was looking for when he turned to the *Indi* was a practical system of providing for all mankind a way of escape forever from rebirth. This does not in the least imply either that there was no true philosophy—in Porphyry's terms—in India or that Porphyry was not aware of the position. This is simply the limiting context of the topic. Indeed insofar as Augustine may reflect Porphyry's views on the point, the Indian Gymnosophists were said explicitly to philosophize: *nudi philosophentur, unde gymnosophistae nominantur*.<sup>9</sup>

It takes even less than my limited acquaintance with Indian philosophies and religions to know that the *Indi* have been at all times greatly preoccupied with practical methods of escaping from the cycle of existences. Of the six classical systems of philosophy the Sāṅkhya, Vaiśeṣika and Mīmāṃsā at least

are reported to have concerned themselves with salvation of one kind or another. That great Hindu text, the *Bhagavadgītā*, teaches the three paths to salvation. Jainism aims at isolation (*kaivalya*): Buddhism aims at *nirvāṇa* in which all distinctions cease to exist.<sup>10</sup> Indian systems of religion always had a strong element also of ritual purification and emphasized, to a degree not so frequent in the West, a very rigorous asceticism.<sup>11</sup>

The notion of the incarnation of a deity to do a service to mankind is prominent in Indian texts. Thus in one branch of Hinduism Viṣṇu is credited with ten *avatāra*—as fish, tortoise, boar, man-lion, dwarf, Paraśurāma, Rāma and Kṛṣṇa, the Buddha and finally (yet to come) Kalkī who will descend on the earth to destroy the wicked and restore purity.<sup>12</sup> And in that development of Buddhism called the Great Vehicle (*Mahāyāna*) the aim of the Buddhist monk is not the old goal of the *arhat*, that is illumination and entering into *nirvāṇa* and being extinguished, but of the *bodhisattva*, that is illumination and the declining, when it is possible, of entering into *nirvāṇa* and rather giving oneself to lead others to *nirvāṇa* by teaching and example.<sup>13</sup>

Finally, the idea of two ways to salvation, one conventional and visible, the other higher and absolute, is found among the followers of the Great Vehicle, who associated the absolute way with themselves, and the conventional with the followers of the Little Vehicle (*Hīnayāna*).<sup>14</sup>

I have ventured the preceding remarks solely to indicate that a complex of notions centring on a universal way of salvation is very prominent indeed in inherited systems of Indian philosophy and religion.

But one may ask if Porphyry searching in his day for such notions could have found them readily? This is the relevant question for us who are concerned with the historical confrontation of Indian wisdom and Neoplatonism. On the matter of the mutual influences of India and the Graeco-Roman world one must be on one's guard against great generalizations. As Filiozat remarked: "Entre temps s'était substitué au préjugé de l'Inde institutrice du genre humain, celui

de l'Inde fermée, de l'Inde ayant créé une civilisation en vase clos."<sup>15</sup> It is possible, as we may see from Derrett's thesis that the *Questions of Milinda* were influenced significantly by Western thought,<sup>16</sup> that our generalizations may now be running to a full circle. Here, however, I shall keep as far as possible to facts as hard as I can find them.

It is hardly necessary to dwell on the contacts of Palestine, where Porphyry was born in 232/3 A.D., or Greece, where he studied at Athens under Longinus, or Italy where he was the disciple of Plotinus, with India in the centuries immediately preceding his birth. Few have not heard of the 120 ships that sailed eastward to India every year at the beginning of the Christian era. Trade with the Roman Empire had assumed great importance in the economic life of southern India, as, for example, the excavations at Virapattanam (the Poducé of Ptolemy?) are reported to indicate. But there were many other marts where Graeco-Roman traders operated, as Tamil literature attests for the period 70-140 A.D. *Direct* Graeco-Roman trade is said—perhaps imprudently<sup>17</sup>—to have declined from around 200 A.D., that is shortly before the time of Porphyry's birth. But indirect trade continued through the Arabians and Persians. Porphyry, born in Palestine, is unlikely, therefore, not to have some near contemporary and contemporary knowledge of India and the Indi. Indeed, as we shall presently see, we know that he had.

He also had, of course, access to quite a considerable amount of published material which began to accumulate after the invasion of Alexander and Nearchus's account of India and of his voyage, which took place around 312 B.C. Foremost amongst this was the *Ἰνδικά* of Megasthenes, who was for some time resident at the court of Chandragupta in Patna towards the beginning of the third century B.C. Nearchus and Megasthenes were used very freely indeed in the *Ἰνδικά* of Arrian who died around 175 A.D. and by others. The relatively great size and range of the literature available in the Greek and Latin languages on India and the Indi in Porphyry's day can very conveniently be judged by English

speakers from the series of compilations of relevant texts in translation done by J.W. McCrindle towards the end of the last century.<sup>18</sup> His translations may not always be accurate, and one must in any case check them against the best texts in each case now available—but he deserves mention here as one who did a great service to those who wish to see how the classical world viewed the world of India. Among pre-Porphyrian authors quoted by McCrindle on the Indi and India at some length are the Pseudo-Callisthenes, Diodorus Siculus, Strabo, Pliny, Dion Chrysostom, Aelian and Clement of Alexandria.

There is much reference in this literature to the *mores ac disciplina* of the Indi. Megasthenes himself made religion and the customs of India major parts of his treatment. Incidentally he was criticized on the ground that his Greek background in philosophy and myth made him an unreliable observer, inventing parallels between two quite different cultures. We should be suitably warned! We, for our part, have to concern ourselves principally with how, historically, the Graeco-Romans saw the Indi, *not* how they *ought* to have seen them.

The Graeco-Roman world in Porphyry's own, third, century is described by Festugière,<sup>19</sup> borrowing the term from Hippolytus, as *καταπλάγεις*, smitten, by what he calls the *mirage oriental*—the idea that the Easterns had better and purer ideas of the deity, communicated to them in more than just rational ways. Taking his cue from Festugière, Filiozat, despite his awareness that Eastern and Western doctrines might develop independently, attempted to show that Hippolytus of Rome (died 235) learned the doctrines of the *Upanisads* through Christian heretics affected by Eastern ideas, and expounded them in his *Philosophoumena*, dated between 222 and 235 A.D.: "ce sont donc les *Upanisad*, les *Upanisad* seules, et spécialement la *Matry-up*, qui sont à la source de l'information d'Hippolyte sur les doctrines brâhmaniques."<sup>20</sup> Hippolytus could not, Filiozat contends, have got his information from such as Megasthenes: "les principales données de son

exposé, les précisions relatives à la nature du Θεός des Brâhmanes, ne se retrouvent pas dans les fragments qui nous sont conservés de Mégasthène."<sup>21</sup> While one might well have reserves on Filiozat's thesis of Christian heretics importing the doctrine of the *Upanisads* to the West, it is probably safe to accept with him that Rome—and *a fortiori* Alexandria<sup>22</sup>—had concrete information on the philosophy of the Brahmins. If the doctrine of the *Upanisads* was available towards the middle of the third century in Rome and Alexandria, then Porphyry can hardly have escaped knowing it.

Here one should at least mention Dihle's interesting thesis<sup>23</sup> that every author likely to have had stylistic ambitions avoided any allusion to contemporary or late Hellenistic India. According to the standards of literary tradition in the time of the Roman Empire, India was to all intents and purposes the country Alexander subjugated and Megasthenes lived in, and nothing else. On the other hand India as represented, for example, in early Christian writings, even in those which have some literary and stylistic pretensions, exactly corresponds to all the information which had been collected by sailors and tradesmen during the first two centuries A.D., information which had been used by the geographers of the same period but neglected by the men of letters. If Dihle's thesis is correct then Porphyry and his contemporaries could have known very much more about India and the Indi than they transmitted to us.

Among the written sources from which Porphyry *did* draw his information on the *mores ac disciplina* precisely was almost certainly Philostratus's work *In Honour of Apollonius of Tyana* which I shall refer to as Philostratus's *Apollonius of Tyana*. The second and third books of this work deal with Apollonius's romanticized visit to India and comprehensive conversations with the sage Iarchas, who claimed to have been King Ganges in a previous existence, at a time when the Ethiopians were still, he said, being an Indian race, living in India. Porphyry at any rate refers to this work in his own *Life of Pythagoras*. This is not surprising since Philostratus's

life overlaps with Porphyry's. Philostratus lived in Tyre (which is either Porphyry's birth-place or near it) from 216 A.D. and subsequently went to Athens around 219 A.D., a city where Porphyry later lived. Indeed the *Apollonius of Tyana* was published in Tyre itself, while Philostratus was living there.

We have regretfully no similar reasons for having an opinion that Porphyry had available to him in any way the *Questions of Milinda*, a Buddhist dialogue composed in Pali sometime after 100 B.C.—but perhaps as late as the second century A.D. *Milinda*, probably the person known to the Greeks as Menander, king of a Greek territory in India around 100 B.C. clearly symbolizes the cultural union of Indians and Greeks. But we do not know if this very important document on the Greek and Indian encounter in wisdom was known or indeed linguistically accessible to Porphyry or his Western contemporaries.<sup>24</sup> We leave it, therefore, out of account here.

We have, however, the testimony of Porphyry's own *de abstinentia* IV.16-18, that he had been briefed, especially on the Brahmins, by one Bardesanes (Bar Daisan), called the Babylonian by Porphyry, who is said to have acquired his information on India from conversing with the members of an embassy from India, possibly one sent to the Emperor Elagabalus who reigned from 218 to 222 A.D. In addition, he lived at Edessa next to the Persian frontier. Here, therefore, is Porphyry himself on the Brahmins and Samanaeans.<sup>25</sup> Although the quotation is rather long it may be excused since it gives in the clearest and firmest manner an idea of the kind of thing Porphyry could associate with the *mores ac disciplina Indorum*:

But since we have already made mention of one of the foreign nations which is known to fame, and righteous and believed to be pious towards the gods, we shall proceed to further particulars regarding them.

For since in India the body politic has many divisions, one of them is the order of the holy

sages, whom the Greeks are wont to call the Gymnosophists, and of whom there are two sects—the Brahmins and the Samanaeans. The Brahmins form the leading sect, and succeed by right of birth to this kind of divine wisdom as to a priesthood. The Samanaeans, on the other hand, are selected, and consist of persons who have conceived a wish to devote themselves to divine wisdom. Their style of life is described as follows by Bardesanes, a Babylonian who lived in the days of our fathers, who met with those Indians who accompanied Dandamis on his embassy to the emperor. For all the Brahmins are of one race, all of them deducing their origin from one (common) father and one (common) mother. The Samanaeans, again, are not of their kindred, but are collected, as we have said, from all classes of the Indians. The Brahmin is not subject to the authority of the king, and pays no tribute with others to the state. Of these philosophers, some live on the mountains, and others on the banks of the river Ganges. The mountain Brahmins subsist on fruits and cow-milk, curdled with herbs, while the dwellers by the Ganges subsist on the fruits which grow in great plenty on the banks of that river, for the soil produces an almost constant succession of fresh fruits—even much wild rice which grows spontaneously, and is used for food when there is a lack of fruit. But to taste anything else, or so much as to touch animal food, is held to be the height of impurity and impiety. They inculcate the duty of worshipping the deity with pious reverence. The whole day and greater part of the night they set apart for hymns and prayers to the gods. Each of them has a hut of his own in which he passes as much time as possible in solitude. For the Brahmins have an aversion to society and much discourse, and when either occurs, they withdraw and observe silence for many days, and they even frequently fast. The Samanaeans, on the other hand, are, as we have observed, collected from the people

at large, and when any one is to be enrolled in their order, he presents himself before the magistrates of the city or of the village to which he happens to belong, and there resigns all his possessions and his other means. The superfluous parts of his person are then shaved off, and he puts on the Samanaean robe and goes away to join the Samanaeans, taking no concern either for his wife or his children, if he has any, and thinks of them no more. The king takes charge of his children and supplies their wants, while his relatives provide for his wife. The life of the Samanaeans is like this. They live outside the city, and spend the whole day in discourse on divine things. Their houses and temples are founded by the king, and in them are stewards who receive a fixed allowance from the king for the support of the inmates of the convents, this consisting of rice, bread, fruits, and pot-herbs. When the convent bell rings, all strangers then in the house withdraw, and the Samanaeans entering offer up prayers. Prayer over, the bell rings a second time, whereupon the servants hand a dish to each (for two never eat out of the same vessel). The dish contains rice, but should one want a variety he is supplied with vegetables, or some kind of fruit. As soon as dinner, which is soon despatched, is over, they go out and go to their usual occupations. They are neither allowed to marry nor to possess property. They and the Brahmins are held in such high honour by the other Indians that even the king himself will visit them to solicit their prayers when the country is in danger or distress, and their counsel in times of emergency.

Both classes take such a view of death that they endure life unwillingly, as being a hard duty exacted by nature, and accelerate the release of their souls from their bodies; and frequently, when their health is good and no evil assails or forces them, they take their leave of life. They let their intention to do so be known to their friends beforehand, but no one

offers to prevent them; on the contrary, all deem them happy, and charge them with messages to their dead relatives, so firm and true is the belief in their own minds, and in the minds of many others, that souls after death have intercourse with each other. When they have heard the commissions entrusted to them, they commit their body to the flames with a view to sever the soul from the body in completest purity, and then they die amid hymns resounding their praises, for their most attached friends dismiss them to death with less reluctance than it gives us to part with our fellow-citizens who set out on a distant journey. They weep, but it is for themselves, because they must continue to live, and those whose death they have witnessed they deem happy in their attainment of immortality. And neither among those Samanaeans nor among the Brahmins whom I have already mentioned, has any sophist come forward, as have so many among the Greeks, to perplex with doubts by asking where would we be if every one should copy their example."<sup>26</sup>

This passage was quoted almost verbatim by Stobaeus, and so must have been considered by him at least to be an obvious passage for selection from Porphyry—and others—on what they had to report on the Theosophists of India. The gist of the passage can be summed up as follows: the term Gymnosophists is applied to both Brahmins and Samanaeans. Both are concerned with divine wisdom; both live a life of righteousness; both are vegetarians; both engage in much prayer; and both aim at happily freeing their souls from their bodies as soon as possible, so that they may enter into an immortality in which they will encounter former friends. The Brahmins, whether those who live in the mountains or on the banks of the Ganges, are called philosophers and regard it as impure and impious even to taste anything other than fruit, cow-milk, rice or herbs or even to touch animal food; they live in silent solitude as far as possible and impose fasting on

themselves if they have observed this less than they consider proper; they spend practically all their time praying to the gods. The Samanaeans, on the other hand, live in community outside a city, abandoning all possessions and care of family; don a special robe and shave off superfluous parts of their persons; eat only rice, bread, fruit or pot-herbs; spend their days in discourse on divine things and have formal prayers.

One can then, I think, say that when Porphyry speaks of looking not to any philosophy taken very strictly but to the *mores ac disciplina Indorum* for a universal way of the soul's deliverance from the cycle of existences, these were at least the kind of *mores* and *disciplina* that he had in mind. Both terms, *mores* and *disciplina*, apply to the regime of righteousness and purification that Porphyry himself describes in relation to the Gymnosophists. But the term *disciplina* can, and almost certainly does here, imply more. Augustine uses the term as meaning 'doctrine'—and, of course, this is a frequent meaning of the term.<sup>27</sup> Indian righteousness and purification were related to philosophical doctrines—the existence of 'gods' (however different the Indians were from Porphyry's 'gods'), the duty of worshipping deity, the immortality of the soul (again however differently that immortality might be understood), and, above all, the possibility of escaping from the cycle of existences.

Here, then, we have evidence of the impact of Indian 'philosophy'—loosely considered and *mores* on an important Neoplatonist. If the range of his knowledge of and interest in Indian wisdom are not altogether distorted by the context from which we have elucidated them—and this is, of course, a possibility—then we are here given firsthand and valuable evidence on the theme of our conference.

Since Augustine in the *City of God* implies that other philosophers, including specifically the 'Indi', hold a number of philosophical doctrines which he outlined as corresponding to those of the Platonists, that is, including Plotinus and Porphyry among others, one is obliged to consider whether Augustine knew of these doctrines as being held by the Indi

from Porphyry or *aliunde*. In either case—since Augustine could claim to be a Neoplatonist too—the matter is of interest to us.

In the eighth book of the *City of God*<sup>28</sup> Augustine refers to the philosophy of all nations and isolated for his attention only those who hold the following doctrines: that there is a God who is the author of created things, the light by which things are known, and the good for which things are done; the principle of existence for us, the truth of doctrine, and the happiness of life. It is easy to see that this is a very Platonic presentation of these doctrines, organized as they are in accordance ultimately with the Platonic classification of Physics, Logic and Ethics. Moreover Augustine elaborates at length details of these three great headings, where, in my view, it would be quite unjustifiable for us here to follow him. But the general doctrine that there was a creator who is the source of illumination for us and also is our final good, even if couched in Platonic terms, is apparently attributed by Augustine to the Indi and we may accept this with some confidence: among those who hold these propositions he lists Platonists and Pythagoreans and "in addition such men of other nations who were regarded as wise men or philosophers and who were persuaded and taught the doctrines mentioned." The other nations then specified are Atlantic Libyans, Egyptians, Indians, Persians, Chaldaeans, Scythians, Gauls, Spaniards.

I know of nothing written on Augustine's knowledge of the Indi—but I must give here some idea of how independent of Porphyry he could have been. Of course, he had available to him quite independently much of the information on the Indi that was available to Porphyry and some, undoubtedly, that was not available. It is known, for example, that the accession of Julian the Apostate, a Neoplatonist also, to the imperial throne in 361 A.D., seven years after Augustine was born, was marked with much interest among the Indi. Ammianus Marcellinus tells us that Embassies from all quarters flocked to the Emperor, the Indian nations vying with emulous zeal in

sending their foremost men with presents as far as from the Maldives and Ceylonese. To what extent this stimulated interest in Italy and Africa in India and the Indi we cannot know. But we might mention, however, for example, that curious document *Περὶ τῶν τῆς Ἰνδίας ἑθνῶν καὶ τῶν Βραχμάνων* preserved under the name of Palladius,<sup>29</sup> a Latin translation of which is attributed to Saint Ambrose.<sup>30</sup> Augustine regarded Ambrose as his spiritual father when he lived at Milan, the Emperor's see, for some years from 384. Ambrose, moreover, was at the centre, it is now thought, of a Christian-Neoplatonist circle at Milan which he probably brought to the notice of Augustine. If Ambrose did do such a translation,<sup>31</sup> then it would very likely be an important recent source for Augustine on the *mores* of the Indi and the Brahmins, even if, as might appear, it had little to add that was not already to be read in Porphyry, for example, or Strabo.<sup>32</sup> We have evidence, in any case, that Augustine at least knew of Philostratus's *Apollonius of Tyana*. He cannot but have known something of the sections of Philostratus's work that describe miracles performed by Apollonius, since he received a letter from Marcellinus—the very person to whom the *City of God* is addressed—(*Epistle* cxxxvi) in which is set forth an account of the controversy between Hierocles and Eusebius of Caesarea concerning these very miracles. Moreover in *Epistle* cii.<sup>32</sup> Augustine refers explicitly to Apollonius of Tyana as a *magus* and philosopher and to the wonderful things attributed to him.

It can be seen, therefore, that when Augustine includes the Indi in his list of philosophers who hold that there is a God who is the author of created things, the light by which things are known, and the good for which things are done, he may have, but need not have, depended on Porphyry. Such views are indeed to be found either explicitly or implicitly in the Classical sources available to both Porphyry and Augustine that I have indicated. Megasthenes, for example, is quoted by Strabo as follows:

... yet on many points their [i.e. of the Indi] opinions coincide with those of the Greeks, for like them they say that the world had a beginning, and is liable to destruction, and is in shape spherical, and that the Deity who made it, and who governs it, is diffused through all its parts. They hold that various first principles operate in the universe, and that water was the principle employed in the making of the world. In addition to the four elements there is a fifth agency, from which the heaven and the stars were produced. The earth is placed in the centre of the universe. Concerning generation, and the nature of the soul, and many other subjects, they express views like those maintained by the Greeks. They wrap up their doctrines about immortality and future judgement, and kindred topics, in allegories, after the manner of Plato. Such are his [Megasthenes's] statements regarding the Brahmins.<sup>33</sup>

Megasthenes also reported that among the Brahmins was a sect that held that "God was light, but not such light as we see with the eye, nor such as the sun or fire, but God is with them the Word—by which they mean... the discourse of reason, whereby the hidden mysteries of knowledge are discerned by the wise."<sup>34</sup> And, as Porphyry himself reports in the text from the *de abstinencia* already quoted, the Brahmins spend almost all their working hours worshipping the deity.<sup>35</sup>

Despite these more philosophical beliefs which I have been able only in a general way to describe and only very tentatively to associate from the *City of God* with either Porphyry or Augustine, the latter, always bearing in mind his main thesis, nevertheless includes the Indi among those who, whatever their more worthy beliefs, resorted in fact also to the cult of many gods.

Philostratus's *Apollonius of Tyana* indeed attests clearly that the Indi had a range of minor gods in charge of various

divisions of activity: "there are many gods in the heavens, many in the sea, many more in spring and river floods, and many whose province is earth, and some beneath the earth."<sup>36</sup> These gods delighted in sacrifices and various appellations. Moreover the Indi practised divination: "the devotees of divination became inspired under its influence and contribute to the *salvation of mankind*."<sup>37</sup> Yet the *Apollonius of Tyana*, though it purports to give a comprehensive survey of all Brahmin teaching, public and private,<sup>38</sup> does not tell us of any *universal way* for the delivery of the soul from the cycle of existences. And although Porphyry is said by Augustine to have searched for such a universal way in the *mores ac disciplina Indorum* he did not find it there.

Joseph Bidez and Franz Cumont in their "Préface" to *Les Mages Hellénisés* proclaim that one of the great problems of the history of ancient thought is 'celle des rapports de l'hellénisme et de l'Orient'.<sup>39</sup> The greatness of the problem is ample justification for the holding of a conference such as this. It is also, I hope, some justification for exploring an approach to the problem on a front even as narrow as I have attempted.

I believe that I have sufficiently alerted you to the fact that my primary source, Augustine, is interested in the *City of God* in what Porphyry has to say about the Indi only in relation to whether or not the Indi teach some universal way of delivering mankind from the cycle of existences. He does not, therefore, refer to all of Porphyry's acquaintance with the Indi and their wisdom, or even such of this as was perhaps known to him.

The evidence, however, which I have brought forward suggests, taken by itself, that the Neoplatonist Porphyry, aware as he was of the traditional Greek regard for the wisdom and philosophy of the Indi, was strongly impressed by the organized piety, abstinence, and general ascetic purgation of the Indi, intended to result finally in a total separation of the soul from body of whatever kind. He was curious to discover if they had any practical method of achieving this result for the mass of men. Later authors, Theodoret (died c. 466),

Claudianus Mamertus (died c. 474) and Aeneas of Gaza (died c. 518) report—in all likelihood, however, using the same source as Augustine—the same interest of Porphyry, which, of course, may be an interest peculiar to Porphyry or of a developing or weakening Neoplatonism. It is, nevertheless, one perhaps not unimportant or unrepresentative strand in the evidence that we must use to clarify the great problem to which Bidez-Cumont refer.

24. See J. Duncan M. Derrett, "Greece and India: the Milindapañha, the Alexander-romance and the Gospels," *Zeitschrift f. Religions Geistesgeschichte*, 19 (1967), pp. 33-64, and "Greece and India again: the Jaimini-Aśvamedha, the Alexander-romance and the Gospels," *ibid.*, 22 (1970), pp. 19-44. Derrett contends that the *Questions of Milinda* reflects neither a Greek nor a Sanskrit 'age', but rather that of the Kushans, and dates therefore from the period 50-200 A.D. Moreover he maintains that the work contains Alexander-romance and Gospel material, thus indicating Indian dependence on the West rather than the opposite. W. W. Tarn, *The*

*Greeks in Bactria and India* (Cambridge, 1951), pp. 432-6, puts forward an hypothetical *Questions of Milinda* written in Greek which reached Alexandria in Egypt by or before 100 B.C. Even if the hypothesis were accepted, we would still have no evidence that Porphyry knew it.

25. Filliozat argues, in "La doctrine des brâhmanes. . .," in *Revue de l'Histoire des Religions*, cxxx (1945), p. 84, that Bar Daisan is speaking not of Brahmins but of Buddhists. A. Dihle appears to agree that Porphyry's *Samanaeans* are Buddhists: art. cit., p. 22. But see Schwarz, art. cit., p. 13 and n. 2.

**Plotinus  
and the  
*Upaniṣads***

---

Lawrence J. Hatab

*Old Dominion University  
Norfolk, Virginia*

The aim of this paper is to present a general comparison of the thought of Plotinus and the *Upaniṣads*. The thinking of Plotinus serves as a rare vehicle which can productively bridge the so-called gap between East and West. Within the language of the western philosophical tradition, Plotinus presents a striking parallel to the form of thinking predominant in India. The basis of this comparative investigation is a remarkably similar four-fold structuring of reality found in Plotinian and Upaniṣadic thought. Our method will be to single out basic elements of Plotinus's thinking which radically distinguish him from the mainstream of the western tradition, and then to analyse, through a point by point comparison, prevalent themes in the *Upaniṣads* which correspond to Plotinus's world-view. And it is hoped that the emergence of such philosophical similarities in a thinker who worked within the Greek tradition, and who felt he was being faithful to that tradition,<sup>1</sup> will prompt the realization that perhaps thought is not entirely bound up within a culture, and that a reconciliation of East and West is not only valuable, but perhaps natural.

The predominant perspective of western thought began with and grew out of Aristotelian philosophy, where the proper object of thought and value is the intellectual apprehension of individual form, through the discovery of universals immanent in individual form.<sup>2</sup> Plotinus, while not denying this perspective, nevertheless claims something further, that the *ultimate* object of thought and value is something which transcends form, both individual and universal, which transcends intellect, and which transcends individual consciousness. With his distinct vision of the One Plotinus undermines a principle that had apparently been fundamental to Greek thought—that the limited and finite is the perfect, while the unlimited and infinite is the imperfect.<sup>3</sup> In contrast, Plotinus claims infinity, unlimitedness and formlessness to be the One's nature, and then calls this the ultimate ground. Plotinus here unveils a new awareness in western thinking, that of a positive infinity, no longer viewing indeterminateness as an imperfection. And because of this absolute transcendence of the One, the most appropriate analysis of the One is a negative analysis.

Generative of all, the Unity is none of all; neither thing nor quality nor intellect nor soul; not in motion, not at rest, not in place, not in time: it is the self-defined, unique in form or, better, formless, existing before Form was, or Movement or Rest, all of which are attachments of Being and make Being the manifold it is. . . . we should put neither a This nor a That to it. [VI.9.3]<sup>4</sup>

The notion of this One as absolute source gives Plotinian thought the following characteristics which distinguish it from tradition. First, since the One is all-pervasive, any differentiation is not strict distinction but must be explained through his emanation-return scheme. The levels of being established by Plato are not separate or distinct. They are emanations of the One, the One-in-dispersion. And in ascendance, the soul

does not contemplate the Ideas, gazing upon them in a subject-object distinction. If the soul is to raise itself to divine intelligibility, it must *become* Nous. Plotinus's hypostases are not therefore objective realms, separate from the soul; they must be seen as levels of spiritual experience.<sup>5</sup> The soul ascends to Nous not by "discovering" it, but by realizing the ground of Nous within itself. Thus firstly it is this mystical affinity and unity of aspects of being that distinguishes Plotinus's thinking.

Secondly, the nature of the One requires that it be beyond even the divine intellect of Nous. The One is an ever-present source infinitely productive of acts of intelligence. However, productive activity is intelligence, Nous, not the One, which is the *source* of this activity. The true vision of the One is not in Nous; this vision is undifferentiated and is therefore no longer intelligence. Rather Nous is oriented toward the One, it is suspended from and turns toward the One. This suspension-from and turning-toward is the first moment of manifestation from the One, resulting in a manifested intelligence, always grounded in the power of the One, with unity as its principle of operation. Plotinus does not exclude intelligence or deny its importance, but the fact that the One is beyond Nous, means that Nous must go beyond itself. Nous is a stage in the realization of that which generates intelligence. Therefore, the One, or the ground of being, transcends being, and thus transcends intellect. This is a crucial departure from the dominant trend in western thought. All intellection is distinction, a subject-object distinction. And for Plotinus the Platonist, this is a *real* distinction, since the objects of thought, ideas, are realities. There can be no distinctions in the One, therefore the One has no intelligible or intellectual characteristics; it is above knowledge; it is a higher reality than thinking and being (III.9.7,9; V.3.11).

Thirdly, with the absolute transcendence of the One, and the soul's power to ascend to union with the One, the soul ultimately relinquishes its individuality (VI.7.35). Here we are in

conflict again with most of western thought, especially Christianity. But for Plotinus, this surrender of individuality is not to be regretted. It is the soul's very nature to transcend itself; it finds its true reality in union with the One, just as *Nous* fulfills its search for unity through its self-transcendence. This union could not take place unless soul, intellect and the One had an ontological affinity, a similitude which allows the union. This secret affinity between the soul and the divinity is the basic premise of any mysticism.<sup>6</sup>

The Plotinian One carries both a mystical and an intellectualistic interpretation.<sup>7</sup> The latter sees the One as the basis of intellect while the former affirms that, since intellect has its source in the One, then intellect is the One from the standpoint of intelligence, and intellect must eventually therefore transcend itself and *become* the One, since reality is a process of emanation and return. Reality could not be a cohesive whole without this circular dynamism.

In sum, it is Plotinus's refusal to give ultimate status to form, individuality and intelligence that radically sets him apart from the Greek tradition in which he operated. For the purpose of transition, let us again locate Plotinus's attitude toward intelligence. There seem to be two aspects of intelligence. First there is the articulated system of definite notions, the intelligible order, the fixed model of the sensible order. This is the Greek and generally the western emphasis. Secondly we find thought directed toward itself, where subject-object distinctions disappear, and where finally intelligence is transcended and the self is merged with the universal principle.<sup>8</sup> This seems foreign to Greek and most of western thought. The first considers rational knowledge of the universe, the second considers a mystical union of beings in the One. The relation of the individual to the universal had always been a Greek problem. But Plotinus moved to show that the universal is present in its entirety in all things without losing its universality. He no longer sought rational knowledge of the universal, but a mystical union where individual consciousness disappears. This is a withdrawal from particular forms,

and all ethical and intellectual aspects of the soul, where the self is lost in contemplation. And it is generally this emphasis on contemplation as the ultimate reality that most conclusively connects Plotinus with the thought of India.

The *Upanisads*<sup>9</sup> are fundamental to the philosophy of India. Each different form of Indian thought has always had to reconcile itself with them. With the coming of the *Upanisads*, Vedic hymns and rites were replaced by a search for the one reality behind all flux. This was also a movement from the "objective" to the "subjective."<sup>10</sup> The key to the One is found within the depths of the human self. The *Upanisads* often criticize ritualistic religion; liberation is an internal, not external experience. The goal of the liberated self is not the bliss of a heaven or rebirth in a better world, but freedom from the objective, *karma*, and union with the Absolute, which is not in any "state." Vedic knowledge is in itself insufficient for liberation. One must have that unexternalized, uncognitive "knowledge" of the Self. Though Vedic knowledge can lead to Self-knowledge, knowing the Self transcends the entire range of human knowledge (cf. the One as the self-transcendence of *Nous*).

The seers of the *Upanisads* asked: what is the one reality multiplicity is reducible to, what is that which persists throughout change? This ultimate reality is called *Brahman*, which comes from the root *bṛh*, to grow, burst forth, and suggests a huddling over, a ceaseless growth<sup>11</sup> very similar to the idea of overflowing power in the Plotinian One. And like Plotinus, for the *Upanisads*, the world emanates from *Brahman* and returns to *Brahman*, while despite this emanation, *Brahman* remains ever-complete and undiminished. In Indian thought creation is not *ex nihilo*; creation is not making but a becoming, the self-projection of the Absolute, which therefore does not really "create" the world but becomes the world.<sup>12</sup> The *Śvetāśvatara Upaniṣad* repudiates all the then-held notions of creation, of it being due to time, nature, necessity, chance, elements, Person, or combinations of these, and calls creation simply the nature of the Absolute, tracing the world simply

to the power of Brahman. Creation does not come about for any "reason," therefore one cannot determine creation to be anything other than the self-expression of Brahman. Why does Brahman create, or manifest? Like the Plotinian One, it is the very *nature* of Brahman to manifest. And again echoing Plotinus, if Brahman is to ground the manifest, it must be unmanifest, or without form, so it can *ground* form, and not itself be one of the forms. The *Subāla Upaniṣad* (VII.1) tells us that Brahman is the indwelling spirit, moving through all the functions and facets of reality and thought, yet these facets themselves apprehend it not; Brahman is beyond all thingness. Because of this, the *Upaniṣads* too consider the most appropriate analysis of Brahman to be a negative analysis.

Absolute Being is not an existing quality or object of thought. It transcends all attempts to grasp it, as it is the source of all manifestations. It can only be described negatively, as the formless, nameless, etc. In relation to concrete beings, it is non-being, but in itself it is the fullness of Being. But we must still not ascribe any positive determinations to the unlimited, the undetermined. Brahman is without form and is beyond sight and the world of objectivity (*Śvetāśvatara U.* IV.20). Brahman is the all-pervading God, devoid of qualities (*ibid.*, VI.11). The *Subāla U.* gives a long list of negative descriptions of Brahman (III.1), and also negates even the negative descriptions by saying that Brahman cannot be said to be dual or non-dual, mortal, or immortal, internal or external knowledge, or both, and it partakes of neither knowledge nor non-knowledge (V.15). In the *Maitrī U.* (VI.3) we find that Brahman has two aspects, the formless and the formed. Though Brahman can take form, in the world, the formless is the fundamental reality, the "cause" of the formed effect. And in the *Bṛhad-āraṇyaka U.* we hear the statement at IV.5.15 that Brahman is *neti neti*, not this, not that (cf. *Enn.* VI.9.3, cited above).

As in Plotinian thought, this absolute transcendence of Brahman demands that it be beyond intellect. Mind and sense,

which operate through subject-object distinctions, are misleading, are *avidyā* or "ignorance," if blind to the intuitive level of *vidyā* or "wisdom" which characterizes "knowledge" of Brahman. If the Real is seen as an object of knowledge, it cannot be known. True knowledge or *vidyā* is an integral creative activity of spirit knowing nothing external to it. Truth is not an expression or reflection of reality, it is reality itself. Knowledge and being are the same thing, inseparable aspects of the same reality, indistinguishable in a realm admitting of no duality. Duality is an otherness, an estrangement, a fallenness. Intellect moves within this sphere of duality. The intuitive level of *vidyā* stems from a unity. The *Mundaka U.* (I.1.4) distinguishes between two kinds of knowledge, higher and lower, *parā vidyā* and *aparā vidyā*. This distinction seems to correspond to the Plotinian distinction between "knowledge" or vision of unity and knowledge of multiplicity. *Parā vidyā* is a knowledge of imperishable Being; *aparā vidyā* is a knowledge of perishable beings. The latter is not false; one can seek Brahman in a particularized manner, yet if it is sought merely as particular and not grounded in *parā vidyā*, the result is still bondage and ignorance. It seems that *aparā vidyā* culminates in intellect and *parā vidyā* manifests as vision, an experience. Again this corresponds to the difference between Nous and the vision of the One. One can understand the *Vedas* and the teachings on Brahman, but this understanding will always be insufficient without the actual *experience* of one's ground, the vision, the clarity of illumination. One can know God only by becoming godlike, not by thinking about God (thus the importance in Indian religion of yoga, or non-theoretical techniques to further expanded *experience*).

The *Kena U.* states that Brahman is the basis of mind, life, sense and it is not an object subject to these states (I.1-2). Brahman is beyond thought, life, sensation (I.3), therefore the impossibility of communication and description. Brahman is above the known, yet also above the unknown (I.4), meaning we can "know" Brahman, but not through the mind. And then we hear the famous paradox concerning Brahman:

To whomsoever it is not known, to him it is known: to whomsoever it is known, he does not know. It is not understood by those who understand it; it is understood by those who do not understand it. [*Kena U.* II.3]

The Supreme is one essence with two natures, eternal immutability and unceasing change, stillness and motion. All motion moves out of its stillness. Unity and multiplicity are both aspects of one reality. Unity is truth, *vidyā*; multiplicity, its manifestation, is *avidyā*, but is false only when viewed in itself, cut off from its ground. This affirmation of the lower realms is an important, though rarely stressed aspect of absolutist-type philosophies such as the *Upaniṣads* and Plotinus. Unity *upholds* multiplicity, though not vice versa, "the all-pervading air supports the activities of beings" (*Īśa U.* 5).

It moves and It moves not; It is far and It is near:  
It is within all this and It is also outside all this.  
[*Īśa U.* 3]

This is a paradox to express an ineffable reality. Brahman is beyond the categories of thought, hence it is expressed negatively and contradictorily. And yet it is not a void; all things are filled with Brahman, which is the basis of reality and cannot therefore be ascertained in any determinate way. The basis of all things cannot be a thing (cf. *Enn.* III.8.10; VI.9.5) even an immaterial "state." And it is this very transcendence which allows Brahman's immanence, its presence within *all* things.

Brahman's immanence indicates that it is not merely the unmanifest, it is all the world as well. Brahman sustains the cosmos and is the innermost self of each individual. Transcendence and immanent universality are *both* real aspects of one Brahman; in the former Brahman is not dependent on the manifold, in the latter it is the principle of the manifold (cf. the two aspects of the One-Nous relation, i.e., the One in itself, and the One as the source of Nous). What follows is a

notion found often in the *Upaniṣads* concerning levels of being, where the levels are seen as Brahman in relation to the world.

In the *Śvetāśvatara U.* (I.1) we find that Brahman is the cause of all things. But Brahman in its unmanifested nature cannot be viewed as a cause. So Brahman as cause is Brahman as *Īśvara*, or Lord, the principle of creation. Previously we have seen that the absolute source is impersonal Brahman. *Īśvara* is the creator working through the power of *māyā*. Brahman in relation to the world is *Īśvara*; but Brahman's absolute nature transcends *Īśvara*. This corresponds to Plotinus's notion that the One in relation to the universe is Nous, the divine Ideas as source of the universe.

Brahman is *both* personal and impersonal, formed and formless, two aspects of one reality. *Īśvara* is the Absolute from the standpoint of form. When we find in the *Upaniṣads* mention of a creator, or cause, we must be careful to keep in mind the distinction between Brahman and *Īśvara* in order to avoid confusion. The fundamental reality is formless Brahman. Brahman in relation to the world is *Īśvara*.

Besides *Īśvara* we often come across a notion of a World-Soul, sometimes called Brahma or *Hiraṇya-garbha*,<sup>13</sup> which seems to represent the creator-God *at work* in the world. This World-Soul is not sharply distinguished from *Īśvara* in the *Upaniṣads*, as it is intimately grounded in *Īśvara* and Brahman. These three principles, Brahman, *Īśvara*, and *Hiraṇya-garbha* are continually referred to, in various contexts, as the basis of the manifested world. But each is subtly distinct in meaning, and we must therefore rank them. It is hard to find such systematization in the *Upaniṣads*, though there are suggestions in the *Taittirīya U.* and the soon to be considered *Māṇḍūkya U.* Much of the "systematization" of the *Upaniṣads* comes to us through the later commentaries of men like Śaṅkara and Rāmānuja. However, we can legitimately structure such principles on the basis of the philosophical assumptions at work in the *Upaniṣads*. Therefore we come across Brahman, the unity of all, and also a World-Soul, which is subject to the changes

of the world and is therefore effect-Brahman as distinct from Īśvara or cause-Brahman. Īśvara is eternally transcendent and is not subject to world changes. The World-Soul arises at the beginning of the world and dissolves at the end.<sup>14</sup>

Therefore, as the *Māṇḍūkya U.* tells us (2), Brahman has four quarters; this can be analysed as four levels of being: (1) A transcendence prior to any concrete reality, Absolute Brahman; (2) A causal foundation of all differentiation, Īśvara or cause-Brahman; Īśvara is looked on as *prāñña*, a supreme intelligence which holds all things in an undifferentiated condition, a divine wisdom which sees *all* things as a primordial whole, unlike human reason which sees things in parts and relations; (3) An interior essence of the world, a World-Soul, effect-Brahman, called Brahma or Hiranya-garbha. This World-Soul emanates from Īśvara the creator (*Śvetāśvatara U.* III.4; VI.18; *Muṇḍaka U.* I.1.9); (4) A manifest world of multiplicity, called *virāj*. These are four coexistent sides of one reality. The Absolute is not a sum of these, or an elimination of any. It is an ineffable unity in the midst of which conceptual distinctions are possible, but only to serve *our* understanding. Brahman has strict distinctions only phenomenally.

Now if we look back over these four aspects of reality and compare them with the Plotinian realms: (1) One, the absolute, undifferentiated, formless source; (2) Nous, the divine Ideas, principle of creation; (3) World-Soul, the agent of creation; (4) the sense world—we find a remarkable similarity of structure.

One of the most famous expressions of this four-fold structure of reality comes to us in the *Māṇḍūkya Upaniṣad*. Here the syllable *AUM* is seen as representing Brahman. This *Upaniṣad* views the levels of reality from the standpoint of the stages of consciousness leading to a realization of Brahman, and corresponds to Plotinus viewing a metaphysical structure in terms of spiritual attitudes, the inward ascension of the soul to the One. First we have the letter *A*, signifying the waking state, *viśva*, a cognition of external objects. Next is *U*, the dreaming state, *taijasa*, a cognition of internal objects.

Next is *M*, the dreamless state, *prāñña*, a mass of cognition, neither internal nor external. Finally there is the transcendental state, *turiya*, the silence surrounding the syllable *AUM*, the unity and basis of all, with no cognition whatsoever, pure Being. *Prāñña* is a unity, but thought becomes one, wisdom. *Turiya* is beyond thought, it is the *source* of thought. *Prāñña* is the basis for creation, and hence manifest, though still a unity, the unified seed of creation, having multiplicity latent within it (quite similar to the Plotinian Nous). *Turiya* is the ground of this creative basis. It is the stillness out of which emanates the creative principle. Here we are given a distinction between the Absolute and God, Brahman and Īśvara, the Unmanifest and Manifest. Creation is a secondary phenomenon. The primary phenomenon is the impersonal Absolute, and the spontaneous emanation out of its stillness. The creative principle, though a unity, is still a manifestation of the Absolute. This Absolute, as *turiya*, is characterized as being not internal, not external, not a mass of cognition, not the cognitive, not the non-cognitive, the unseen, ungraspable, unnamable, unthinkable, the non-dual (*Māṇḍūkya U.* 7).

So the levels of being as described in the *Upaniṣads* can be expressed through the following equations:

1. *A* = *viśva* = waking state = external objects = *virāj* = world;
2. *U* = *taijasa* = dream state = internal objects = *Hiranya-garbha* = World-Soul;
3. *M* = *Prāñña* = dreamless state = mass of cognition, wisdom = Īśvara = creator;
4. Silence = *turiya* = transcendental state = source of all = *Brahman* = peace.

And these levels can easily be seen to correspond to Plotinus's stages of reality:

1. Sense world and the individual soul immersed in its externality;
2. World-soul creating the world from within itself;

3. Nous, the creative principle, unity of divine Ideas;
4. One, undifferentiated source of all.

As in Plotinus, the levels of being found in the *Upaniṣads* are not "other" than the Absolute Brahman, but they themselves are not the ultimate reality. To reach the Absolute, one must penetrate to the formless Brahman. This is accomplished by the self journeying within to its innermost depths where it is one with the Absolute. In the *Upaniṣads* there is a kinship between Brahman and that which seeks Brahman, the self of man. This kinship is explained through the notion of *Ātman*, the principle grounding individual consciousness. In the early prose *Upaniṣads*, *Ātman* was the ground of individuality as distinguished from Brahman, the supra-personal ground of the cosmos. Soon this distinction diminished and the two were identified.<sup>15</sup> Brahman is the transcendent other and the spirit residing within man. Brahman is known through *Ātman*. This whole world is Brahman and this self within me is Brahman too (*Chāndogya U.* III.14.1,4). In order to find the divine one must look within the human soul (*Enn.* V.3.9). Brahman and *Ātman* are two aspects of one reality.

The *Upaniṣads* thus teach the intimate unity of the self of man and Brahman. The wise see God abiding in their self (*Śvetāśvatara U.* VI.12). The knower of Brahman becomes merged with Brahman (*ibid.*, I.7). The individual self sees its true reality as the source of all (*Kaivalya U.* 20-23). It is the task of the individual self to become the Universal Self, and this is not attainable through the *Vedas*, intellectual knowledge, discipline or brain power (*Subāla U.* IX.15), but only through a union. Every individual self has the power to break the veil of separateness and achieve unity, become the Absolute Self. Liberation, *mokṣa*, is different than an existence in paradise, *śvarga*, which is still a part of the manifest, still an individual existence in time. Liberation is not a departure to another "world," nor an expectation of a future state, but the experience of the timeless, placeless presence of Brahman, it is this presence.

This union is the transformation of the soul, the absorption in the divine, seeing one's self in all beings and all beings in one's self (*Īśa U.* 6). One who realizes this is released from sorrow, as all sorrow results from duality (*ibid.*, 7). The self loses itself, casting off all name and form it enters into the Unmanifest (*Muṇḍaka U.* III.2.8). Such is a release from the cycle of birth and death, the wheel of time and change, the achieving of the state *kaivalya*, aloneness (*Kaivalya U.* 25). All of this of course corresponds to Plotinus's flight of the alone to the Alone.

In its initial condition, sometimes the soul is depicted as wandering about, thinking itself different from Brahman, looking on multiplicity as its sole reality (*Śvetāśvatara U.* I.6). This is quite similar to Plotinus's image of the soul wandering through the sense world. Union with Brahman cures the soul of this *avidyā*, or individuality seen in itself independent of its ground, and brings about *vidyā*, or awareness of Brahman. This *avidyā-vidyā* scheme is somewhat comparable to the Plotinian fall-return imagery. Sorrow is seen as the helplessness resulting from being lost in the objective world; salvation involves getting beyond object-thinking to the realm of pure Being (*Śvetāśvatara U.* IV.7).

With the ecstasy of divine union, the world is looked upon as a troubled dream, as illusion, *māyā*. The world is a covering of untruth which hides or veils the truth (*Chāndogya U.* VIII.3.1-3). But it is a mistake to assume that an indifference to the world or a world-denial necessarily results from this.<sup>16</sup> Both the Absolute and Personal God are real; manifestation is not denied. One must "negate" the world to reach Brahman but only to return and redeem the world (*Īśa U.* 18). The world is Brahman, not its own reality. The meaning of *māyā* is that the world is not its own meaning. *Avidyā* is ignorance, viewing the world as its own meaning, as ultimate, as not grounded in Brahman. *Māyā* is a cosmic creative principle, but also the possibility of *avidyā*. *Avidyā* is the subjective phenomenon of ignorance arising from the mistaken attribution of ultimate reality to *māyā*, seeing the play as real, as in itself.

Hence the manifestation of primordial Being is simultaneously a concealment of its original nature. This concealment is *avidyā*. Therefore the world is not unreal, it is merely not independent. There is nothing without Brahman; the unreality of the world is the world seen in itself.

On this point, at times Plotinus accounts for the world through a fall of the soul, resulting from a spiritual pride, *tolma*, forsaking unity for particularity. This seems to be a denial of the value of the world. But in other instances Plotinus sees the descent of the soul as a metaphysical necessity, part of the emanation of the One.<sup>17</sup> The world cannot be denied if the One is ever-present and immanent. Perhaps what Plotinus intends here is what is suggested in the *Upaniṣads*. Perhaps an embodied soul is not evil, but a soul *attached* to a body is evil. So perhaps the world is not evil, but attachment to the world is evil. So the descent into the world is good, is a metaphysical necessity; but this descent allows the possibility of becoming attached to the world, concealing the true reality of the divine realm (the nature of the One defines detachment in a sense). It is *this* aspect of the world, this aspect of the descent which must be modified and which must be considered unreal and valueless. Blind absorption in the world, not the world itself, is that which Plotinus seeks to overcome.

In the *Upaniṣads*, overcoming *māyā* means overcoming worldliness, valuing the world in itself. The meaning of *māyā* is not concerned with the existence of the world, but with the *meaning* of the world, not the factuality of the world, but the way we look upon the world.<sup>18</sup> At times the *Upaniṣads* say the world is appearance, and only Brahman is real; sometimes it is said that the world is real, though not independent of Brahman. Either way, the world is not false or evil, it is merely unfundamental, not being its own ground. This point concerning the status of the world is an important one, needed to counter accusations of nihilism and world-denial thrown at both Plotinus and Hinduism.

We have been able to see deep similarities of thought between Plotinus and the *Upaniṣads*. We find the soul initially

trapped in a fallen awareness, attending to multiplicity and change as the only reality. The task of the soul is to purify and deepen its awareness to reveal the absolute, formless source behind these manifestations. And this awareness is not external but internal, found at the depths of the soul. The soul *is* this Absolute at its depths, hence its individuality is transcended, individuality as an ultimate principle is transcended. The world is an emanation (immanence) of a formless ground (transcendence); form is not the ultimate reality, it must ultimately deny itself, transcend itself, and return to its ground. This is the process of reality, that of emanation and return, reflected in the thought of Plotinus and the *Upaniṣads* in a noticeably similar fourfold organization.

In closing, let me very briefly address the question of Indian influence on Plotinus. I must admit to a certain amount of disinterest in the issue of influence or inter-cultural contact in this regard. I have to say that I like the idea of the independent development of Plotinian thought, viewing it as the consequence and fulfillment of certain fundamental tendencies inherent in Greek philosophy.<sup>19</sup> But I see this "independence" as a modified one, closer to the independence of identical twins separated at birth. There may therefore be a common origin, but one which has nothing to do with cultural or historical contact, but which rather has to do with the necessary depths of thought itself, which thinkers of depth will apprehend similarly. I am somewhat suspicious of influence-theories. They can be seen to stem from either of two far from dispassionate intentions: (1) The impulse to preserve the sanctity of western rationalism by determining non-rational elements to be of external origin; (2) More generally, from the standpoint of historical determinism, which disclaims the possibility of spontaneous creation, thereby diluting the essence and effect of genius, and which therefore cannot claim to be sober philosophical analysis but rather the spectacle of lesser minds dragging greater minds down to a more negotiable level, i.e., subject to external influences. Even

though all thought works with an inheritance, genius is characterized by its autonomy, innovativeness and self-radiance. After being exposed to the genius of Plotinus, I find it hard to believe that he would have sought or needed outside help in articulating his vision. Plotinian and Indian parallels should prompt not a search for historical influences, but rather a re-evaluation of the supposed philosophical distance between the East and West.

## NOTES

**Proclus  
and the  
*Tejobindu Upaniṣad***

---

Laurence J. Rosán

*Miami Beach, Florida*

This paper is an essay in comparative mysticism. The word "mysticism" is being defined, for the purposes of this paper at least, as (1) a philosophical doctrine, namely, that the conscious individual can and should experience a uniting with 'the divine', that is, the Ultimate Reality. Thus mysticism is both a psychology and an ethics, but naturally these in turn presuppose an underlying metaphysics; and this is generally that of absolute, monistic idealism, since if the individual is *consciously* to unite with the One Reality, that Reality itself must be a kind of consciousness. (Other, non-monistic metaphysics, where the object of union is the highest but not sole reality, are also possible though not of concern to us here.)

But mysticism is also (2) a subjective experience for the individual mystic. The mystics of all times and places have spoken of their experiences, though with a great range of difference in the degrees of their introspection, thoroughness of their descriptions, and so on; some have simply alluded, others have been voluble but vague, others have indeed tried to be precise. Now in modern terminology the effort to report on one's own experience in a self-aware and somewhat

philosophical way has been called "phenomenological description," or simply "a phenomenology." (Although sometimes this word is interpreted as if it implied a universal validity, actually, by definition, it can *only* pertain to some individual's subjective experience, though objectively reported.) Therefore, as an individual's subjective experience that is reported to others, mysticism may also be called phenomenology. And this paper will be an essay, not in philosophical doctrine or historical web of mutual influence, but in the comparative phenomenology of mysticism.

For this purpose I have selected two examples, the Neoplatonist Proclus, and the *Tejobindu Upanisad*. The selection of Proclus is no accident since my doctoral thesis (*The Philosophy of Proclus, the Final Phase of Ancient Thought*, New York: Cosmos Greek-American Press, 1949) was a general survey of his whole philosophy; but Proclus is peculiarly apt for this purpose. He stands practically at the end of development within Neoplatonism, which was of course abruptly truncated by the unfortunate intolerance of Christianity, but which might have further advanced into startlingly new directions had it been given the chance. There's no telling what stimulating, even profound ideas would have been provided by a Neoplatonism that had complete freedom to evolve. Proclus, standing just before the truncation of ancient Neoplatonism, offers the clearest example of the novel and suggestive conceptual trends that might have become more fully developed by such a freedom.

To focus on the phenomenology of mystical experience, I will select only those elements in Proclus which seem to bear directly on this theme. They are:

(I) Proclus's intuition (novel for a Neoplatonist) of the *organic* unity of all levels of reality, as expressed through two ontological principles: (A) "All things are in all things, though in a befitting manner," and (B) the interaction between "providential (benevolent) love" and its correlative, "returning (yearning) love"; and,

(II) Proclus's unusually subjective approach to the mystical experience, which I suggest may be called "the integrative immanence of the One Reality."

I. (A) It is well known how, starting with an earlier, simpler cosmology of the World-Soul, World-Mind and the One, Neoplatonism gradually developed further levels of reality, possibly as a reflection of individual mystical experience, but in Proclus more likely as a kind of 'Aristotelian' desire for precision in cosmological relationships. Thus Proclus interpolates "Finiteness" and "Infinity" immediately after the One, together with a whole nearly-infinite series of individual unities or "henads" which mediate between the Absolute Unity and everything else. (Proclus further interpolated other levels of reality, but these lower levels will not concern us here.) Now since every Idea, if not every thing, has its own unity or henad, clearly this highest characteristic of the universe, that is, 'oneness', exists on all lower levels also, although in a manner befitting that level. Conversely, by a unique doctrine, Proclus maintains that the Absolute One, as the sole Cause of the universe with its many mediating henads, in some sense contains all other things within Itself where they *remain*, that is, where they exist logically prior to their "proceeding forth" or emanating. Therefore everything is found within the Highest One Itself, although in a manner befitting Its absolute transcendence. Because this pattern applies to every level of reality, it is clear that "all things are in all things, but in a befitting manner" (*πάντα ἐν πᾶσι, οἰκείως*), that is, the higher are in the lower and the lower are in the higher.

Now since the goal of the mystical experience is to achieve unity with the One, yet each and every thing already *has* some aspect of unity to it—its own henad—Proclus suggests a kind of *aesthetic technique* by which to initiate the mystical experience: concentrate on the unity of some thing or idea, intuitively experience this sense of unity, and then transfer this intuition of oneness to one's own self and *its* relationship with the One Reality. This aesthetic technique is not the same

as the mystical experience itself; but Proclus's mystical consciousness will have been influenced by this prior effort to grasp the sense of unity, partly by means of sensory perception and using so-called material objects, and partly by meditating on sacred names and/or symbols. In fact Proclus speaks highly of "theurgy or theosophy" (respectively, "working with the gods" or 'wisdom about the gods'; but the term "gods" simply refers to the unities or henads themselves, since the One Reality, "the Divinity," produces its mediating henads or "divinities," that is, "gods"). All that the term "theurgy or theosophy" should denote, strictly speaking, is this aesthetic technique of obtaining a feeling of unity from sensory perceptions of material objects or meditation on evocative ideas. Nevertheless, living at the end of an evolution within ancient Neoplatonism, Proclus had been influenced by, e.g., Iamblichus's effort to preserve the values of classical polytheism by incorporating many popular religious customs into Neoplatonic practice, even theory. Thus Proclus additionally alludes, for example, to a ritual of burning figurines made of several substances so that the resulting smoke will "unify what was previously a mixture," an act which of course can be *utilized* by an aspiring mystic but which undoubtedly had prior existence as a popular religious practice! Therefore, whatever the actual content of Proclus's mystical experience as such, it must have been pervaded by the *memory* of having made these aesthetic and religiously theurgic efforts, including (1)(a) visual aesthetic contemplations of objects of nature (cf. the Taoist/Zen spiritually-oriented aesthetics, or Berkeley's statement, "We do at all times perceive manifest tokens of the Divinity—everything we see, hear, feel, or anywise perceive by Sense being a sign or effect of the power of God"); and also (b) what might analogously be called "mantric" meditations on divine names and "mandalic" concentrations on symbols. But further there would have been the memory of (2) religious or ritual acts such as mentioned above; and I suggest (on the basis of Marinus's *Biography of Proclus*, written only a year after Proclus's death), that Proclus's attitude included

*piety* towards ancestors and departed teachers, an intense *loyalty* to the besieged and dying Greek polytheism, and a resultant *nostalgia* for the glories of the philosophic and religious past whose doom could be easily and sadly forecast.

(B) Regarding Proclus's mystical experience itself, we should consider his twofold meaning of the word "love." First, in common with the Platonic and Neoplatonic tradition in general, "love" means the yearning, aspiring movement of the inferior consciousness as it 'returns' towards the sources of its being after having emanated from them to begin with. But, as mentioned above, by his unique doctrine of all things 'remaining', that is, pre-existing in their higher causes, not only can Proclus say that the higher causes contain their lower effects, but also that they "know these effects beforehand," that is, they *fore-know* (Gr. *προ-νοεῖν*, Lat. *pro-videre*). And this foreknowledge is also a kind of love; it is indeed the "providential love" (*ἔρως προνοητικός*) by which the higher causes in a sense benevolently fore-know and even *care for* their effects. Here we are only concerned with the highest Reality, the One Itself, and so we can specifically say that the One Reality loves everything else in the universe, which is contained within Itself, by a providential kind of love. And as the knowing consciousness moves upwards by means of the aspiring, returning kind of love, it ever more clearly becomes *aware* of this continually-flowing benevolent, caring love that comes from the Absolute One above. This interaction, even 'reciprocation', of the returning and the providential types of love, therefore, constitutes a very important content of the mystical experience as Proclus might have phenomenologically reported it. (In other Neoplatonists not only would the idea of the One Reality's providential, benevolent *love* be absent, but also the feeling that there is an interaction, even reciprocation between the two kinds of love.) Obviously this is a personalizing of the One Reality which might seem surprising in as abstract a philosopher as Proclus who, in e.g., the *Elements of Theology* and the *Platonic Theology*, always refers to the One Reality as "It" (*τὸ ἓν*). But as remarked above,

Proclus sincerely followed the leadings of Iamblichus and his own teacher Syrianus in making every effort to integrate classical polytheistic piety with the most precise kind of metaphysics. (Thus in his *Chaldean Philosophy* and *Hieratic Art*, he can even use the metaphorical term "Father" of the One.) And so we must assume that if Proclus had phenomenologically reported on his mystical experience, he would have had to acknowledge that a considerable portion of it consisted of a feeling of personal interaction and almost loving reciprocity with a very transcendent entity. (We should be careful, however, not to interpret this in traditional theistic terms. The personal gods of Greek adoration were to be elevated and legitimized by *their* identification with the One Reality; in no way was the One being lowered by *Its* embracing of their anthropomorphic and culturally diverse qualities.)

(II) As mentioned above, the technique by which anything could achieve unity with the One Reality requires the intermediary of its own unity or henad. So of the human consciousness which, in its journey towards the Absolute has been primarily using its own intuitive mind (*νοῦς*), we would expect that its springboard to the One Reality would be the highest unity that this *mind* could conceive. Proclus indeed discusses this possibility. The unity or divine henad of any individual mind he calls the "flower" of that mind, a poetic way of referring to the intuitive feeling of the unity of our highest thinking. But Proclus specifically rejects this idea and substitutes something even more total: the "flower," that is, the unity or henad of our *whole* 'soul' or personality; that is, the unity of our *whole existence*. By this Proclus means all our conscious power, opinion as well as knowledge, daily and mundane experience as well as philosophico-religious awareness. Notice how different this becomes subjectively. In the case of reaching the One through the unity of our intuitive mind alone, there must be a total withdrawal from all sensory distractions, mundane thoughts, etc., and the most intense

concentration upon the unity of our highest ideas as a springboard to the One Goal, a technique that emphasizes *Its* transcendence. But in the case of the "unity of our whole existence," there's very little that we must really withdraw from—perhaps at the most from the minutiae of daily living, but not from our fundamental desires, attitudes, even weaknesses. Here there would be no pinpointing of attention, but rather an immanent, integrative feeling of self-identity which would therefore suggest an immanence of the divine object, at least at the moment of the mystical union. So though the One Reality is, as Proclus says, "Absolutely Transcendent," by approaching It through the "unity of his whole existence" he must have experienced a sense of divine immanence as *all* aspects of his 'soul' or personality were being integrated with this now-very-close universal Reality. Perhaps the expression "integrative immanence of the One" may be helpful in suggesting the phenomenological nuance intended here.

At least two other Proclean terms regarding the mystical experience, "faith" and "madness," should be considered. The first word, "faith" (*πίστις*), is defined as a "kind of pseudo-belief." Like belief, it is not based on firm knowledge or intuitive grasp, but unlike belief, which is on a lower level, faith pertains to the highest knowledge, the awareness of the One Reality which is higher than the intuitive Mind. The word "faith" therefore refers to a technique of feeling unity with the One Reality but, following its specific connotation, by a distinctive means, namely (I suggest) the effort to *yield* oneself, to give oneself up entirely to the awareness of *Its* integrative immanence in the whole personality. So far "faith" is simply a single term for a complex mystical effort. But in line with Proclus's sincere loyalty to the classical religion, it's very possible to regard this word as additionally filled with traditional late-Greek polytheistic nuances. The second word to be considered is "*μανία*," generally translated since Plato as "divine madness." This would seem to connote that enthusiasm, that energy and joy which results from the mystical

union once achieved. But Proclus does not further elaborate about divine madness, an omission which we should regret.

Let me summarize therefore a hypothetical phenomenological report given by Proclus on his mystical experience: "I, Proclus Diadochus (that is, "Successor" in the Golden Chain of the Platonic tradition), having already sought to increase the feeling of unity within myself by contemplating the unities of particular natural objects, names and symbols, and by employing the pious theurgic or theosophic rituals of the religious tradition to which I remain loyal, have now by these means become strengthened in the sense of my own unity. I gather together all my conscious faculties, ideals, desires, in short, all the elements of my soul or personality, into a feeling of total, integrative unity which I know is caused by the One Reality already close to me. Receiving Its overflowing providential and caring love which reciprocates my own aspiring, yearning love for It, I give myself up to Its absolute Oneness by an act of 'faith', as it were, and am rewarded with that inexpressible enthusiasm, energy and joy, that 'divine madness' which has been so long revered by the Golden Chain of Platonic Successors."

My reasons for selecting the *Tejobindu Upaniṣad* are, of course, very different from those in the case of Proclus. Having read nearly all the 108 *Upaniṣads* in one or another modern language, I have found Chapters 2 and 3 of the *Tejobindu* to contain the *uninterruptedly longest litany of first person singular consciousness*. A "litany" (originally a series of supplications) has come to mean any recital of ideas having the repetitive qualities associated with the original litanies. "First person singular consciousness," when put into writing, refers to declarative sentences which start with the words "I am" or which can be easily translated into such sentences. Such litanies of first person singular consciousness are found in the *Chândogya*, *Ātmabodha*, *Maitreyi*, *Mahā*, *Subāla*, *Adhyātma*, and *Mahāvākya Upaniṣads*, and particularly

in the *Brahmavidyā* (verses 81-III); while Chapters 4 and 5 of the *Tejobindu* contain four separate litanies whose content reflects that of Chapters 2 and 3. But these passages are mostly only short paragraphs, while the *Tejobindu* litany of Chapters 2 and 3 runs to over fourteen pages in the English translation (*The Sāmānya Vedānta Upaniṣads*, tr. into Eng. by T.R. Śrinavāsa Ayyangār, on the basis of the commentary by Śrī Upaniṣadbrahmayogin, and ed. by Pandit S. Subrahmanya (Śastri, Madras: Adyar Library, 1941)). And since this passage directly pertains almost exclusively to the mystical union, that is, to the unity of the knowing Self (*Ātman*) with the One Reality (*Brahman*), the *Tejobindu* offers a rich source for a phenomenological report of a certain kind of mystical experience. It is in fact a wonderful monument in the history of absolute subjective idealism!

One difference between Proclus and the *Tejobindu Upaniṣad* is that the former was a highly individualistic person whose life is authenticated down to the smallest details, whereas it is well known that the actual writers of the *Upaniṣads* are anonymous much more often than not. To be sure, Chapters 2 and 3 of the *Tejobindu* begin with the sentence, "Kumāra asked his father . . . and he, the venerable Parameśvara replied. . . ." But this is reported in the third person, so the actual writer would be neither Kumāra nor Parameśvara. Also, "Kumāra" can be a common noun meaning "son" or "prince" in general, as well as being the proper name of at least a half-dozen Vedic figures, while "Parameśvara" can be the common noun "illustrious personage," as well as the proper name of another several people in Vedic literature. ("Parameśvara" could also refer to the "Supreme Lord" but it is very unlikely that the writer of the *Tejobindu* intended a personal God to speak in the first person as if none of this *Upaniṣad*'s great affirmations could be made by any merely human consciousness, which would be totally contrary to the monistic and mystical teaching of the Vedāntists in general and the *Tejobindu* in particular.) Our conclusion is that the

actual writer of the *Tejobindu* is unknown or merely presumed by ascription; we have no biographical data nor firm date. This means that the material for a phenomenological report must be obtained entirely inductively from the text itself.

This text falls into distinguishable sections. The first (all of Chapter 2), though not directly in the first person singular, is a litany of metaphysical affirmations which pertain almost exclusively to subjective experience. The second (most of Chapter 3) is the great "I am" litany which may be considered the heart of the whole. The third is a one-page litany on the falsehood of everything but the knowing consciousness, and the fourth is a more traditional litany on the value of the affirmation "I am *Brahman*." What all these pages have in common is that they are part of a single litany, a constantly repeated affirmation of closely related ideas, and it is almost a certainty, stylistically as well as in content, that this whole uninterrupted litany was the work of one author.

The metaphysical section of Chapter 2 has two subdivisions. In the first, every sentence has the expression "Indivisible One Essence," in the Sanskrit (from the 108 *Upaniṣads*, in Sanskrit (Bombay, 1895)), "akhandāikarasa(m)", that is, *a-khanda-eka-rasa*: not-fragmented/one/inner-sap or essence—we will use the term "Undivided One Essence." In the second subdivision every sentence has the expression "utter consciousness," Sanskrit "cinnātra(m)," that is, *cit-mātra*: thinking-mind/element(al) or nothing-but—we will use the term "Consciousness itself." These two subdivisions are tightly connected by several sentences specifically equating the Undivided One Essence and Consciousness itself as one and the same thing. Indeed there is no conflict here since "Undivided One Essence" is an abstract expression, denoting the One Reality without suggesting its nature, while "Consciousness itself" is the most immediate of all intuitions since we cannot even conceive something which is "not part of our consciousness," except by extrapolating into it our ideas of "dreamless

sleep," etc., ideas however which are known only to our conscious memory! To identify the Undivided One Essence with Consciousness itself is simply to give an intuitively rich predicate to a metaphysically abstract subject. Therefore both subdivisions of Chapter 2 constitute one doctrine, that of absolute idealism, in this case, however, still 'objectively' presented.

We can analyze Chapter 2 by taking all the characteristics applied to the "Undivided One Essence" and/or "Consciousness itself" (in many cases the same characteristics are applied to both), and by arranging them into certain classes of ideas; (please keep in mind that the sequence of these ideas does not reflect the *textual* sequence but rather the *logical* sequence of meanings). First, the Undivided One Essence which is nothing else than Consciousness itself (and which we may find useful to call "the One Undivided Consciousness") is said to include all existence, the whole world near or far, our bodies, indeed Matter itself! Clearly this is absolute idealism (and closely related to the doctrine of Proclus in which Matter is itself only a final emanation from the One Reality). The One Undivided Consciousness includes all actions, all desires (also detachment), all social ideas such as home, friends, wealth, even religious merit and its opposite or sin. All ideas in fact, all knowledge and the objects of knowledge, whether true or false, all meditation, introspection, the very distinction between "you" and "I"—these are nothing but Consciousness itself. The traditional gods and the sacred *Vedas*, the syllable "Om" and the final *Vedānta*, past, present and future, indeed—and here we reach the highest idealistic affirmations—the One Undivided Consciousness includes both what exists and what does not exist; outside of It nothing can be conceived, there is no leaving this Reality. It is that which has no origin, the imperishable, and transcendent; it is *Ātman*, the Self "who Thou art, who I am"; it is *Brahman*. Summarizing: although Chapter 2 is not itself a first person singular statement, it is easily translated into such (as demonstrated

below), though so far metaphysical and best re-stated by the familiar affirmation "I am *Brahman*."

The core of the *Tejobindu* litany is the five and one-half pages (in the English translation) of pure "I am" affirmations. (It is interesting to note how much of the modern "New Thought Movement" such as Unity, Christian Science, Religious Science, etc., makes constant use of first person singular affirmations; it's also noteworthy that Proclus has almost no statements of this type.) Now whereas in the preceding paragraph we started from the most concrete and moved to the most abstract characteristics, in the case of "I am" statements we should use the reverse technique, since the more concrete the qualities assigned to the "I am" the more distinctive and revealing it will be for a phenomenological report. Here therefore is the list of "I am" characteristics in the order of their concreteness: first, "I am *Brahman*" (said no less than eight times); "I am of the form of the transcendent *Brahman*," absolute eternal being, the Undivided One Essence (twice); "I am imperishable and changeless"; "I am Consciousness itself" (very many times), being all wisdom, knowledge, the form of introspection, the absolute *Turiya* consciousness (which is deeper than dreamless sleep) and even beyond the *Turiya*; naturally, "I am *Ātman*" (several times) and the "form of the *Ātman*." (At this point the very frequent expression "form of" (*rupa*) should be analyzed: in an Aristotelian or dualistic doctrine the form of a thing is not identical with that thing itself, but in idealism the 'form' in the sense of essence *is* the thing itself. Probably what is meant here by 'form' therefore is the *appearance* which naturally may be different from the essence. Thus "I am of the form of *Ātman*" would mean "I am not only the One Self, I am also everything that this Self *appears* to be." This could hold for every other instance of the term 'form' occurring above or below.)

The next group of characteristics are put entirely in the negative form (and will be re-echoed in the short section on "falsehoods" discussed below). Thus: "I have no form," no qualities; I transcend all mind or mental faculties such as

speech, sense perception and the objects of that perception; "I am devoid of body," having neither beginning, nor end, old age nor death; I am devoid of all feeling such as passion, anxiety, all desires, including those for wealth, wife and children, and even desires that would result in either bondage or liberation.

Adding a deeper and more emotional content are the "Bliss and Light" affirmations: "I am Bliss" (said many times); "I am the appearance of the Bliss of the *Ātman*, the non-dual Existence, Consciousness and Bliss" (the famous "sat-chit-ananda" triad which is repeated a half-dozen times); "I am the luminosity, the radiance (*Mahas*) of the *Ātman*; I am of the form of Brightness, I alone am of the form of the Sun of Consciousness in the Ethereal Sky of the heart"; "I am ever wakeful and pure; I am pure liberation and salvation" (*Mokṣa*); indeed, "I am absolute Goodness" and—very interestingly showing some similarity with Proclus—"I am absolute Love."

Very different, however, is another class of positive attributes of the "I am" which might puzzle any Neoplatonist, Proclus included; and from this moment an important divergence between Proclus and the *Tejobindu* appears which will become even greater as we proceed. For the *Tejobindu* affirms "I alone appear like everything else"; that is, I am the *appearances* of all things as well as their Reality. Thus: "Nothing, including the earth itself, has been given up by Me," for "whatever is beyond Me is nothing"; "Of my own accord I manifest myself, the *Ātman*"; "I am satisfied by the *Ātman*, I am the form of complete satisfaction"; "I revel in my *Ātman*, I revel in Myself"; "I revel in the delightful kingdom of my own Self; taking my seat on the throne of my Self I shall conceive nothing but my Self"; "I am the essence of exquisite nectar; I am of the form of extreme emotion"; "I have no need for study or reflection, for I am everywhere the enjoyer of pleasure; I am possessed of delights far and near!"

We must assume that the writer of the *Tejobindu* is speaking after many mystical experiences have sunk deeply into his

consciousness. His intuitions are the fruition of these experiences, and the *Tejobindu* here is the phenomenological report of this great subjective-monistic-idealistic experience of his. He is already the Absolute Itself because what we ordinarily call the individual knower has come to feel himself as the One Undivided Consciousness which is all of Reality, and no longer sees any barriers between one thought and the next, including every materialized appearance. The asceticism which is so generally traditional in idealism, and in fact necessary to remove our attention from worldly distractions, has here disappeared into an all-embracing integration, analogous to but rather more total than the integration of personality mentioned by Proclus. Just as it is said that *Brahman* engages in *play* by producing *Mâyā* or "illusion," so here the knowing Self is totally free to enjoy even the worldly "delights far and near" that up to this moment of victory would have been distractions from the goal of concentration (more on this below).

The one page of "falsehoods" that follows the "I am" litany contains thirty-seven sentences declaring different things to be "false," while seven sentences repeat that only *I* am Reality. In line with the previously-mentioned "negative characteristics" all appearances of mind, or whatever has form, in other words whatever is seen, heard, tasted or smelled—all this is declared to be false. All living creatures, all beings, past, present and future, in fact "*everything* is false" compared to the One Reality which alone is true. Very interestingly, an *antinomian* factor is introduced by the specific rejection of many traditional values: teacher and pupil, and "what does not turn from the path of righteousness" are false; "whatever is wholesome" and all scriptures, the whole *Vedas*, etc. are false; indeed "all truth is false." And applying this antinomianism to conventionally 'bad' as well as 'good' things: right and wrong action, good and bad conduct, victory and defeat, desire, enjoyment and satiation—

all these are also false. This antinomian quality in the *Tejobindu* goes much beyond a merely metaphysical kind of rejection of everything except the Self; on the contrary, the writer has specifically chosen traditionally revered values to reject as 'false'. Nor should we shrug off the *Tejobindu*'s language as merely symbolic, for it is affirming that the One Undivided Consciousness which is the maker, manipulator and enjoyer of all Its thoughts, has the specific *right* to deny the claim of any particular thought to Its reverence.

Antinomianism (or the rejection of traditional patterns on the basis of a higher mystical experience) has been a very frequent concomitant of both Eastern and Western mysticism. The fact that it does not seem to appear in Neoplatonism (or in Proclus) may result from the absence in late classical polytheism of any heavy burden of moral prescriptions or proscriptions (as compared, say, to the Old Testament or the Code of Manu). But the *Tejobindu*'s antinomianism is not so much an indication of the burden of Vedic requirements as it is of the thoroughness of the author's mystical experience. What in Proclus is simply alluded to as "divine madness," that enthusiasm, energy and joy which *follows* from the mystical union with the One Reality, here becomes expanded and totally realized. To appreciate this, let me suggest the possibility of Tantrism, that is, the interweaving of mystical experience with sexual experience. I mention Tantrism not because I believe it to be a really important element in the *Tejobindu*'s composition although the combination of the Self reveling in all Its creations plus the specific rejection of any inhibiting proscriptions does constitute a sufficient basis for its existence—but rather because it is the *ultimate touchstone* (considering the traditional attitudes in both East and West towards sexuality) of the seriousness of any mystic's claim to be united with the One Undivided Reality of Consciousness. To make such a claim and then become disturbed by conventional moral proscriptions which are after all nothing but the creations of one's own divine consciousness to begin with, is to reach the pinnacle only to slip back again. The author of

the great *Tejobindu* litany has not slipped back! "I revel in the delightful kingdom of my own Self; I am everywhere the enjoyer of pleasure, I am possessed of delights far and near." And, as if to leave no doubt about it, he adds: "Know that right and wrong action is false, good and bad conduct is of falsehood; know that all scripture is false, all the *Veda* is always false."

Summarizing, I suggest that the writer of Chapters 2 and 3 of the *Tejobindu* would have given a phenomenological report of his mystical experience somewhat as follows: "I am identical to the One Reality, the Undivided Consciousness Itself; therefore I possess all the perfections and qualities that I deem desirable. And since nothing is alien to Me, being part of My One Consciousness, I am the maker, the manipulator, the enjoyer indeed of every thought, of every delight far and near. The phenomenological report of my *mystical* experience therefore is identical to the report of my *total* experience, whatever I choose to make this be, as long as I continue to be aware that I indeed am the sole Reality." This suggested report by the *Tejobindu*'s writer has not included the methods by which his mystical experience had been attained, as in the case of Proclus, because we are not told just which Yogic (etc.) techniques he may have employed. Rather this report centers on the *results* of the mystical experience, the fearless absorption into the all-embracing unity of the knowing Self of every thought and appearance including those that heretofore might have seemed distracting and/or alien to the One. Conversely, Proclus's phenomenological report was more detailed on the steps *leading* to the mystical unity. What Proclus and the *Tejobindu* have in common is their emphasis on the importance of integrating and unifying all one's faculties, though the *Tejobindu* carries this further. Finally, the *Tejobindu* gives a more detailed paean of praise to that enthusiasm, energy and joy that comes from the mystical union which in Proclus is summed up simply by the famous expression "divine madness."

(Almost as an appendix, the *Tejobindu* litany closes with about one and one-half pages on the affirmation (*mantra*) "I am *Brahman*." Certainly this is a 'correct' affirmation, although "I am the Undivided One Essence," "I am Consciousness itself," etc. would be equally correct. And what is claimed to be the results of this constant affirmation, such as ending the false appearance of duality, destroying grief, re-incarnation, even disease, etc., are also correctly deduced from the basic principles of this philosophy. But the level of consciousness here is not as high as before nor an outpouring of the author's own mystical experience.)

This paper has been "an essay in the comparative phenomenology of mysticism," but some readers may object that the emphasis has been on exposition rather than actual comparison. This is as it should be. First, our "phenomenological reports" have been only hypothetical, particularly in the case of Proclus; but even in the case of the *Tejobindu*, which has provided so many directly first-person statements, there is much that might have been said by its author that we do not know. Secondly, enough actual comparison has been given to provide a basis for anyone wishing to do further work in this area. Finally, all those who recognize the One Reality, generally known as "absolute idealists," constitute a kind of world-wide brotherhood whose similarities are much more important than their differences. The *Tejobindu* stands as a wonderful monument in the history of subjective monistic idealism, a minority type within idealism in general; the *Tejobindu* is a victorious, fully accomplished statement. Proclus stands as an interesting example of movement from the strictly objective idealism of earlier Neoplatonism into the sphere of greater subjectivity; he does not, however, offer "a victorious, fully accomplished statement" but rather presents himself to us with an almost self-conscious poignancy, for he was at least partly aware of the impending truncation of the Platonic Succession's Golden Chain. Perhaps some modern student/philosopher could extrapolate from what Proclus has left us to construct a "new Neoplatonism" which would

continue that evolution into greater subjectivity which Proclus had ventured, explored, and to some extent achieved.

*Buddhi in the  
Bhagavadgītā and  
Psyché in Plotinus*

*Introduction*

The *Bhagavadgītā* is the most important text in the *smṛti* (what is remembered) literature of India, as distinct from the *śruti* (what is heard) literature which is traditionally regarded as ultimately authoritative. The *Bhagavadgītā* has been assigned a date ranging from the fifth century B.C. to the second century B.C. The Indian religious tradition places the *Gītā* at the end of the third age of the present cycle of the universe and the beginning of the fourth, namely the *Kali Yuga* to which we belong.

The *Bhagavadgītā* opens on the battleground of *dharma* (order, law, duty, righteousness) which is concretised at an instance of time at Kurukṣetra. Kṛṣṇa had earlier attempted to reconcile the two feuding families of cousin brothers, namely Pāṇḍavas and Kauravas. However, when war appeared inevitable, and both sides wanted his help, he proposed that one side could have all his armies with their weapons, and the

First published in *Religious Studies* 15 (September 1979): 327-42.

other could have him without any weapon. The Kaurava chief, Duryodhana, had the first choice. In choosing the armies he showed little discrimination and intelligence, and no understanding of the true nature of Kṛṣṇa. Arjuna rightly calls him *durbuddhi* (one whose *buddhi* is bad; *B.G.* 1.23). The Pāṇdavas were overjoyed to have Kṛṣṇa on their side, for he is no ordinary man; as he declared himself later, he is the Supreme Person who pervades and sustains all the worlds (*B.G.* 15.17-19). For the purpose of the battle, Kṛṣṇa became the charioteer of the greatest Pāṇdava warrior, Arjuna.

Before the actual fighting begins, Arjuna asks Kṛṣṇa to take his chariot into the middle of the two armies so he could survey all the assembled warriors. From there he sees his teachers, brothers, uncles, cousins, sons and other relatives and friends arrayed in battle on both sides, ready to kill and be killed. Seeing his own kith and kin on both sides, parts and parcels of himself, Arjuna is bewildered about right action and he turns to Kṛṣṇa in despair, at the end of his human tether, to seek guidance. Kṛṣṇa's instruction, in response to Arjuna's need, is not only about his particular duty in this particular situation at Kurukṣetra, but about *dharma* in general; hence about the end of *dharma*, namely, *mokṣa*, unconditioned freedom, which is Kṛṣṇa's own mode of being, as well as about the paths by which Arjuna's being may be transformed so that it may draw closer to Kṛṣṇa's. Kṛṣṇa places the specific situation of Arjuna in a larger context, viewing it from above, as it were, suggesting that every situation has cosmological foundations and every act has universal implications. The dialogue between Arjuna and Kṛṣṇa, constituting the *Bhagavad-gītā*, is as Kṛṣṇa himself says at the end (*B.G.* 18.70), about *dharma*.<sup>1</sup>

A few general remarks about Plotinus and his writing may be useful in showing the possible fruitfulness and the possible limitations of a comparison with the *Bhagavad-gītā*. The *Enneads*, like the *Gītā*, set the being, thought and action of man in the largest cosmological context. The path by which Plotinus always tried to lead his hearers and readers is a path

from ego-centred particularity to the universality, a path which leads on to something very like *mokṣa*, that union with the One or Good which lies beyond the true universe of *Nous*, the highest our thoughts can reach. But the *Enneads* are a body of various treatises written on different occasions, and perhaps for varying purposes, put together somewhat artificially by their editor, and not like the *Gītā*, a sustained exposition of doctrine taking its start from one particular situation which it rises and expands from but never completely leaves behind. Nor did Plotinus ever claim to speak with anything like the authority of Kṛṣṇa. Though a profoundly original and independent thinker, whose thoughts were solidly based on his own experience, he never professed himself to be more than an exegete, trying to bring home to those who would listen to him in his own time, as clearly and forcibly as possible, the meaning of the one true ancient philosophy (that is to say, the one true way of liberation into the divine) which found its best expression in the Dialogues of Plato. And outside the immediate circle of his friends and disciples he did not exercise, and never has exercised, authority in any form of the Western traditions. Very many people down the centuries have read him, and if they read him seriously the results have often been overwhelming and lasting, and his influence has been very great. But in no tradition, either of Christians, Muslims or even later pagan Neoplatonists, has he ever been a teacher of unchallenged authority, whose doctrine must be assumed to be always right. Perhaps his influence on the Western traditions has been so wide because in a way he stands a little apart from them.

There are, therefore, great differences as well as great similarities between the *Enneads* and the *Gītā*. But the differences are not so great as to make a comparison between them unfruitful, as we hope this paper will show. In each we have a body of mature doctrine, based on tradition and living experience, which points by different ways to the same goal. And we should not make it too difficult for ourselves to see this by making much of inappropriate later Western disjunctions,

which would not correspond exactly to any distinction the author of the *Gītā* or Plotinus would be likely to make between 'scripture', or 'revelation', and 'rational metaphysics', or between 'theology', or 'spiritual teaching', and 'philosophy'.

### *Buddhi in the Bhagavadgītā*

The place of *buddhi* in the *Bhagavadgītā* is central. Kṛṣṇa advises Arjuna to "seek refuge in *buddhi*" (B.G. 2.49). "To them who are constantly integrated worshipping me with love, I give that *buddhi yoga* by which they may draw near to me" (B.G. 10.10). Later in the process of summing up his entire teaching, Kṛṣṇa says again, "Renouncing mentally all actions to me, making me your goal, relying on *buddhi yoga*, become constantly mindful of me. Mindful of me, you will overcome all obstacles by my grace. But if because of self-centeredness you will not listen, you will perish" (B.G. 18.57-58).

What is this *buddhi yoga*, the path of *buddhi*, that leads to Kṛṣṇa? It is both integration of the *buddhi* and integration by the *buddhi*, in a mutually supportive evolution. And furthermore, it is the self-transcendence of *buddhi*.

*Buddhi* derives from the root *budh* meaning "to wake up," in the sense of discerning, becoming awake and realizing. In the *Gītā*, *buddhi* is clearly distinguished from *manas* (mind) which is the faculty of thinking. *Manas* stands in an hierarchical order of subtlety and priority between senses and *buddhi*. It is fickle, unsteady, impetuous, and difficult to control—as difficult as the wind (B.G. 3.42; 6.34). It can, however, be controlled and brought to rest in the self by *buddhi*, by arresting and reversing the usual order, which by itself is quite lawful and follows Kṛṣṇa's lower nature.

Ordinarily, the senses are drawn outward by the sense-objects, and *manas* follows them. Attachment of the senses to the objects of pleasure gives rise to desire, desire to anger, anger to bewilderment which causes the mind to wander. This

lack of steadiness in the mind in turn results in the deterioration of *buddhi*. Once *buddhi* is destroyed, man is lost. In such a man without purpose there is a dispersion of *buddhi* into many branches, for only a resolute *buddhi* is single. (B.G. 2.41, 62, 63).

He who will follow the spiritual path should draw in his senses, as a tortoise draws in its limbs. He should renounce *saṁkalpa* (imagination, inclination), without renouncing which no one can engage in *yoga*. Then he can be free of desires, which have their origin in *saṁkalpa*, and can control the senses with *munus*. *Manas* can, in its turn, be slowly anchored in the self by *buddhi* established in steadfastness. When *buddhi* functions in this right internal order, from above below, it has a quickness which can bring the unsteady mind, driven hither and thither by *rajoguna*, the passion principle in nature, back to stillness in the self. Such a yogi, whose mind is stilled and who is free of blemish, enjoys highest bliss and becomes *brahman*, a part of Kṛṣṇa's higher nature (B.G. 6.2, 24-27).

The initial integration, according to the *Gītā*, consists in the unification of *buddhi*. For this purpose, essentially three renunciations are recommended. First is the renunciation of inaction, for Kṛṣṇa himself, although he needs to do nothing, is constantly engaged in action; if he were to stop working, all the worlds would perish. The second renunciation is that of anxiety about and attachment to the fruits of action. One must do what needs to be done for sustaining the world, understanding the principle of reciprocal maintenance between gods and men, as sacrifice and worship (*yajña*), casting all actions on Kṛṣṇa (B.G. 3.11-12, 19-25).

The third renunciation has already been mentioned, namely the renunciation of *saṁkalpa* which is imagination and desire-will. "The wise men consider it to be renunciation: to give up works dictated by desire" (B.G. 18.2).

Corresponding to these three renunciations, three definitions of *yoga* are given in the *Gītā*, indicating different instructions for and stages of transformation of man. (It

hardly needs mentioning that these stages are in no sense linear or mutually exclusive.) *Yoga* is skill in action, it is equanimity in failure and success, and it is the disconnecting of the connection with *duhkha* (suffering), the connection that is forged by desire and imagination (*B.G.* 2.48, 50; 6.23-24).

Works done according to *yoga*, i.e., in accordance with the above interior renunciations, will gradually lead to a weakening of the sense of egoism and of the craving for acquisition. Along with this, *buddhi*, which was so far dispersed in multiple wishes and projects, now emerges unified and attuned (i.e., in *samādhi*) to the higher self (*ātman*). This integrated *buddhi* is now able to bring about a proper (i.e., according to the right order) and a harmonious functioning of the whole of one's psychosomatic organism, effecting the second integration of the *buddhi yoga*.

*Buddhi* in the *Gītā* is a faculty which needs to be trained, purified and unified, and which in turn can integrate the whole of one's self, body, heart and mind. This faculty alone, which functions rightly only when educated by *yoga*, can have higher knowledge (*jñāna*, as distinct from *vidyā*, which generally means mental knowledge), higher feelings (such as *śraddhā*, faith, and *bhakti*, love-and-dedication) and higher will (as contrasted with desire-will). *Buddhi* is thus the discriminative intellect which perceives correctly and acts accordingly; it is intelligent and sensitive will in harmony with *dharma*.<sup>2</sup>

The really important function of *buddhi* in the *Bhagavad-gītā* is to provide a perceptual link between what is higher and what is lower. It is a crucial agent in the transformation (*bhāvana*) of the being of man. The whole process of development is symbolized by Arjuna, who is once called *kapidhvaja*, one whose banner is a monkey (*B.G.* 1.20). In this first chapter, which is full of names, descriptions, and multiple laws, Arjuna is deeply despondent and assailed by many doubts. He is overcome by pity and self-pity and is paralyzed. He is confused about *dharma*, and refuses to fight. In the last chapter, his confusion is destroyed, his doubts are dispelled and he

has recollected himself. He is now a different person; he sees, understands and acts differently. Realizing his own and Kṛṣṇa's true nature, Arjuna takes refuge in Kṛṣṇa and does his bidding.

Kṛṣṇa declares the five gross elements—corresponding to the five senses in man the microcosmos—as well as mind (*manas*), ego (*ahamkāra*) and *buddhi* to be the eight components of his lower nature. Beyond this is his higher nature, source of life, by which the whole cosmos is supported. A part of his higher nature is *brahman*, which in an individual is called his essential nature or inner being (*svabhāva*). By itself *brahman* is neither being nor not-being; within all beings, yet it is without them; although undivided it appears as divided among beings. This higher nature is more or less equated with *puruṣa* (person), as distinct from *prakṛti* which refers to Kṛṣṇa's lower nature.<sup>3</sup> *Puruṣa* is not bound by the three fundamental qualities (*guṇa*) of *prakṛti*, namely, *sattva* (beingness, affirmation, light), *rajas* (passion, redness) and *tamas* (passivity, resistance, darkness) (*B.G.* 7.4-5; 8.3; 13.12-23).

*Prakṛti* and all its manifestations—such as the gross elements, senses, mind, ego, *buddhi*, thought, desire, hate, pleasure and pain—are together also called *śarīra* (body) as well as *kṣetra* (field). *Kṣetra* is distinguished from *kṣetrājña* (knower of the field). Kṛṣṇa declares himself to be the knower of the field in every field. Then he says that true knowledge consists in knowing both the field and the knower of the field (*B.G.* 13.1-6).

We see that *buddhi* itself, although the highest part of any particular being, belongs to nature. Therefore, it is subject to the three *guṇas* which can, depending on which quality predominates, give it different colourations. The *buddhi* which knows the correct distinction between activity and cessation of activity, between right and wrong, between danger and security, between bondage and freedom is *sāttvic*; the *buddhi* which is unclear about these and understands them incorrectly is *rājasic*; and the *buddhi* which thinks all things in the reversed fashion is *tāmasic* (*B.G.* 18.29-32).

However, although *buddhi* itself is a part of the lower nature, it is only through purified *buddhi* that one can go beyond *prakṛti*. The function of *yoga* is in a way a reversal of the natural emanations of *prakṛti* expressing itself in a hierarchy of material manifestations, which in man range from *buddhi* to the senses, farther and farther away from the primal source. By following the path of *yoga*, the sensual man, at the periphery of the expanding circle of emanation, moves inwards to become a man of *buddhi*. For this purpose Kṛṣṇa advises the use of the chief creative force of *prakṛti* responsible for giving rise to different states of beings, namely *karma* (action, work, deed), rather than renouncing it. By an interiorization of the renunciation of *karma*, in offering the fruits of *karma* to Kṛṣṇa, the generative force of *prakṛti* can be used to move beyond *prakṛti* itself; *mokṣa* can thus be approached through *karma* (B.G. 3.31; 8.3).

From the level of the purified *buddhi*, the movement is in a wholly different dimension. In that state in which the senses are quietened and thought ceases, one can experience the boundless joy of the transcendent realm of *ātman*. This joy cannot be perceived by any of the other senses or by the mind but only by *buddhi*. Having seen and overcome the process of emanation, the *yogi* stands stilled in *brahman*, attaining to the sight of *brahman* in which he can see all beings and all things without attachment. He is now beyond all dualities and without a sense of ego or possession. Now he is not anything or anyone in particular, for his own being (*svabhāva*) is merged with Kṛṣṇa's being (*madbhāva*). Therefore, he is no longer reborn as this or that (B.G. 6.20-25; 14.19-26).

Here Kṛṣṇa feels it necessary to remind Arjuna that *prakṛti* is also a part of Kṛṣṇa and that it operates by his own creative and magical power (*māyā*), although it does not constrain and limit him. Kṛṣṇa urges him to fight, for Arjuna must do his part in the cosmic drama; he must become an instrument for Kṛṣṇa's purposes. Taking his stand in his own *brahman* nature, he should act without attachment, renouncing all

works to Kṛṣṇa, self-recollected, without expectation, without acquisition and without agitation, to bring about order in the world (B.G. 3.25, 30; 11.32-33; 14.12).

It is as if the circle of eternity and the circle of time almost touched each other in *buddhi* but not quite. Well-honed and purified *buddhi* functions as the antenna for receiving messages from the other shore, as a lookout into the non-personal spiritual dimension of *ātman-puruṣa-brahman*, and as the guiding will of the individualized *prakṛti*.

Having led up to *brahman*, the task of *buddhi yoga* is essentially finished. It has made possible *jñāna* of the transcendent realm. It has done so by a creative synthesis and balancing of four distinct, yet interdependent, *yogas*. The path of action or *karma yoga*, the path of love or *bhakti yoga*, the path of meditation or *dhyāna yoga*,<sup>4</sup> and the path of knowledge or *jñāna yoga* constitute the four limbs of the *buddhi yoga* of the *Bhagavadgītā* which integrates them into an organic whole.<sup>5</sup> Each of these *yogas* is taught and emphasised in its place, without losing sight of the others. The unformed Arjuna, like linear thinkers before and after him, is anxious to have Kṛṣṇa tell him one definite and clear path, clear that is to his untrained (*akṛta*) and ordinary mind. Kṛṣṇa, however, is less intent on giving Arjuna a one-dimensional, logical consistency or mental clarity. He plays a veritable symphony of *yogas*, and himself uses wisdom, tact, love and terrifying form to help Arjuna become attuned to a higher wisdom. This higher wisdom is not of his personal intelligence, although it is within him. Nor is this *jñāna* any mere speculative theory. The characteristics of *jñāna* include absence of pride, non-violence, patience, self-control, lack of identification with I, unfailing love-and-dedication to Kṛṣṇa, and constancy in the knowledge of self (B.G. 13.7-11). *Jñāna* is a way of life, it is a *yoga*; one who follows the *yoga* of knowledge lives this way. All other *yogas* complement and aid this one, just as it complements them.

Kṛṣṇa himself is still beyond. For he is the foundation of imperishable *brahman*, of eternal *dharma* and of absolute bliss

(B.G. 14.27). He declares in B.G. 18.54-55: "Having become *brahman*, with tranquil self, a person neither grieves nor longs; regarding all beings alike he attains the highest love-and-dedication (*bhakti*) to me. By love-and-dedication he comes to know me as I really am, how great I am and who I am in truth; then knowing me as I am, he enters me forthwith."

A simile given in the *Kaṭha Upaniṣad* says that the body is a chariot of which *ātman* is the owner; *buddhi* is the charioteer, mind the reins and the senses are the steeds (I.3.3-4). Since the teaching of the *Bhagavadgītā* is most closely related, of all the *Upaniṣads*, to the *Kaṭha Upaniṣad*, we may be justified in extending this simile to the situation in the *Gītā*. For Kṛṣṇa to become Arjuna's charioteer at Kurukṣetra is a perfect symbol of Kṛṣṇa having manifested himself in *prakṛti* in order to give Arjuna *buddhi yoga* by which he may come to know himself and Kṛṣṇa as they really are. Then Arjuna can love Kṛṣṇa and act in accordance with his word.

#### *Psyché in Plotinus*

*Psyché* in Plotinus, like *buddhi* in the *Gītā*, has a very long history behind it. But we cannot incorporate a complete history of Greek psychology into this paper, so *psyché* will be described here as we find it in Plotinus, with only brief indications of the most important points of doctrine which he owes to or has in common with his predecessors. Even so, only a sketch of his doctrine can be given here, as it is immensely rich and complex, and his statements about *psyché* contain a good many formal inconsistencies.<sup>6</sup> These inconsistencies are partly due to varieties and incompatibilities in the traditions which he inherited, Platonic, Aristotelian and Stoic, already interacting and combining in various ways before his time: and partly, perhaps, to the fact that "he wrote his treatises straight down as if he was copying from a book" and never revised them or looked them over again;<sup>7</sup> and the treatises are not parts of a planned exposition of a system, but occasional works written for wider or narrower groups of

friends and collaborators in his rather informal circle (which was never any kind of officially recognised academic institution). But there may be a much deeper and more important reason. Plotinus wrote out of his own lived experience: and he would always rather get in all the deliveries of that experience than attain formal consistency by selection, omission or distortion of any part of it. Further, he derives from Plato, and perhaps carries further, a certain scepticism about the adequacy of language to express what he finds within: at the higher levels this scepticism about language becomes total: he knows he cannot say what he sees, however hard he tries, though he does his best. And being a philosopher of late antiquity, he feels bound to use the language and concepts of his school tradition, the Platonic, which was complex and at times incoherent, and to avoid novelties of expression as far as possible (though in fact his language is at times highly original).

The first thing to observe about *psyché* in Plotinus is the enormous range of its functions and sphere of activity. This is something which he owes in great part to the tradition which he inherited. To oversimplify crudely, the concept of *psyché* which he inherited results from a combination of the oldest Greek conception of *psyché* known to us, the Homeric, in which it is the breath of life which leaves the body at death as a mindless ghost, and the Pythagorean-Orphic belief that the *psyché* was a spiritual being fallen from a higher sphere into the cycle of birth and death, capable of wisdom and good conduct, or the reverse, and able eventually to return to its original state by the exercise of wisdom and virtue (or the appropriate ritual way of life in the Orphic version). These come together before Plato: and into Plato's thought about *psyché* there enters too, after much development and differentiation, the conception of the earliest Greek philosophers that the stuff which makes itself into the universe is alive with a life analogous in some ways to *psyché* in man, and sometimes with some kind of intelligence. Aristotle's attempts to delimit

*psyché* at the top by marking it off from pure, divine or god-like thought, *nous*, in a way Plato had not done (in Plato *nous* is a function of *psyché*) created further complications for later Platonists, to be considered in due course. So *psyché* in Plotinus is what makes everything live and grow; it is the principle of physical locomotion and the sensations and appetites which prompt and guide it; it is the principle of all emotions; it is that which thinks discursively; and at its highest reach we discover that it is an eternal inhabitant of the world of divine intuitive thought, the *nous* which is the Platonic Forms or Ideas, and shares its activity and life, and its power of self-transcendence and return to its source beyond thought, the One or Good. And because of its range, it has a cosmic dimension. The psychology of Plotinus differs from most modern psychology (except perhaps that of Jung) in not being exclusively concerned with men. It is a geological, botanical, zoological, demonological, astronomical and theological as well as an anthropological psychology. Everything in the universe of the philosophers of late antiquity is living organism. The earth, the heavenly bodies, and the universe as a whole are ensouled organisms. The life of *psyché* is a continuum reaching from living rock to living gods. Man is not, in fact, very important or exalted in rank among beings possessed of *psyché*. He is rather near the lower end of the continuum in his normal empirically observable this-worldly state. He has, of course, all the levels of *psyché* within him and, by reason of the participation of his highest *psyché* in the eternal life of *nous*, he has the eternal intelligible world within him too. "We are each of us an intelligible universe," Plotinus says (III.4[15].3.21-22; cp. V.7[18].1.9-10 and VI.7[38].6.23). All *psychai* are in a sense one, though differentiated (to various degrees at different levels) in their unity, and in the eternal intelligible world in which *psyché* at its highest is a permanent inhabitant, the unity-in-difference is far more intimate, the interpenetration of parts more complete. "Light is transparent to light." "The sun here is all the stars and each star the sun and all the others" (V.8

[31].4.6, 9-10). Our *psyché* has no absolute limits other than those of universal *psyché*, though its lowly state may make it more difficult to overcome its limitations, and it has limitations which the *psyché* of a god, for instance, has not. And the limits of universal *psyché*, horizontal and vertical, are no narrower than the limits of all existence. Further, there is something in us, though it may be better to call it "self" (*autos*) than *psyché* at this level, which can transcend existence and attain union with its unknowable source, the One or Good.<sup>8</sup> (The rather baffling variations and inconsistencies in the statements of Plotinus about the relation of our *psyché* to *nous* will be mentioned later.) By being *psyché* we are inevitably part of this vast continuum which extends from the depths to the heights and spreads out to the limits of possible being: we cannot drop out of our psychic universality, or really lose or get rid of anything in it. Of course most men are unconscious of most of what is within us (or, better, what we are within) most of the time, and none of us is conscious of all of it all the time—the sort of consciousness in which we can objectify ourselves and talk about the psychic level we are on is not very important or desirable to Plotinus: it is an epiphenomenon dependent on the satisfactory functioning of the compound of lower *psyché* and body. But we can choose on what level we will live: we are not confined to the ordinary empirical-human level of being *anthropos*, "man." We can and should aspire to rise above it, and we can, and probably most men do, fall below it, to live on what is really an animal or vegetable level. And if we do, this will have consequences. Plotinus, like all Platonists, believed in reincarnation, and unlike some, thought a human *psyché* could be reincarnated in an animal or vegetable body. So if we live on a vegetable level in a human life, we may find in our next incarnation that we "have taken the trouble to turn ourselves into trees" (LII.4[15].2.23-24). But we can also (though few do) take the much greater trouble necessary to rise to the highest divine level. If we do, our *psyché* will not, as long as we are in an earthly body, stop functioning on all our lower

levels: in fact it seems likely that it will quite spontaneously function better on the levels of discursive thought, and when required participate in virtuous and beneficent action. The material, space-time universe is in the thought of Plotinus everlasting, without beginning or end, and on its own level real, beautiful and valuable, though only a phantasm or reflection of the intelligible world, and with its characteristic dispersion and separation, leading to conflict, which is not found above. But its existence forever is good and necessary, being the last and lowest self-diffusion of the Good, and it depends immediately, both in general and in its particulars, for its existence, formation and ordering, on *psyché*. Plotinus says that our first step in our return to the Good, which is a matter of "waking up" and understanding who we really are, is to understand that we, as *psyché*, make, animate and direct the material world (VI[10].2). *Psyché* of all sorts therefore must always have the capacity to act on all its lower levels, and must so act when the order of the universe requires. Cosmic and divine *psyché* always does so without, in the normal thought of Plotinus, any disturbance of its unbroken intuitive, noetic contemplation, without calculation, planning or willing, by a spontaneous projection of images and activities which is, so to speak, the reflex of its contemplation. And the ideal state of man for Plotinus seems to be one in which his individual *psyché* behaves as like cosmic *psyché* as possible. And he seems to have lived up to his ideal very well, if we are to accept Porphyry's account. Porphyry's biography is a hagiography, with a tendency to idealize the Master, but Porphyry had known him intimately in the last years of his life, and is sober and truthful as hagiographers go, and his account of Plotinus at the relevant points here rings true to many Plotinian scholars.<sup>9</sup> Plotinus went further than some of his Platonist contemporaries and successors in preaching withdrawal from the rather futile political and social life of the time to wealthy Levantines and Roman aristocrats in his circle of friends, sometimes successfully, but never seems to have recommended or practised withdrawal from human company

or the real human duties which it imposed. In a fine phrase of Porphyry's (*Life*, Chapter 8), "he was present at once to himself and others." He never relaxed his unbroken contemplation, but this did not prevent him writing and lecturing continually and being "at the disposal of all who had any sort of acquaintance with him" (*Life*, Chapter 9). He answered Porphyry's interminable questions, sent him away for a holiday when neurotic depression was driving him to suicide, found a valuable necklace which a lady friend had lost, heard the lessons of his numerous wards and looked after the accounts of their estates, and acted as arbitrator in petty legal disputes. (And he may, for all we know, have done more frivolous things, which his solemn biographer would not have recorded as unworthy of a Sage—he may even have played with the children of whom his house was full.) His withdrawal from the world was primarily an inner withdrawal. He lived austere and simply enough, though in a great and well populated house. But he did not live as a solitary ascetic or monk. And this perhaps helps to give a more vivid and concrete idea of how he thought *psyché* should be in the world.

We now have to consider briefly some puzzling features of the various accounts which Plotinus gives of the relationship between *psyché* at its highest and *nous*.<sup>10</sup> There are passages in the *Enneads* where the situation appears quite simple and straightforward. Plotinus has, so to speak, an official doctrine, which he propounds in many places, particularly when he is explaining how many hypostases or levels of reality there are. In this, below the One or Good which transcends thought and being, there is the One-Being, *nous*, which is at once intuitive eternal thought and Platonic Forms or Ideas in the most perfect thinkable unity, and below this again there is *psyché*, whose characteristic activity is discursive thought and whose function in the great self-diffusion of the Good which constitutes the universe is to transmit as much as it can of the rich and varied plenitude of being which *nous* holds in unity in its eternal contemplation to the material, space-time, world

which *psyché* contains and to which it gives such reality as the material world can have. In one important passage (III.7 [45].11) the wilful tendency of a 'part' or 'power' of cosmic *psyché* to discursive reasoning is said to be the origin of time. Individual *psychai* (though not cosmic soul, even in its lowest activities when it functions as "nature" (*physis*) giving form and life to bodies, or divine embodied souls) can, though they need not, when they are embodied be carried away by their involvement in the material and bewitched and entrapped by this world into an egocentric concern with the needs and desires of their lower individual selves and bodies, though their highest part can never fall or be affected by their lower activities. This seems fairly straightforward and consistent. But when we read further in the *Enneads* we discover that the sharp distinction made between the hypostasis *nous* and the hypostasis *psyché* in the official account becomes blurred, and even tends to disappear altogether. There is a long and important work, divided by Porphyry into two treatises, *On the Reason Why Being is Everywhere All Present, One and the Same* (VI.4-5 [22-23]) in which it is not at all clear for a great deal of the time what hypostasis Plotinus is talking about, and it does not seem to matter very much. In his greatest work on *psyché* (again divided by Porphyry), written not long afterwards (IV.3-4 [27-28]) and a number of other places, we discover that cosmic *psyché* and the soul of the embodied gods do not think discursively but noetically or intuitively, just like *nous*. This is often stated in conscious opposition to the fundamentalist Platonist and Judaeo-Christian doctrine of "artisan" creation, which Plotinus consistently disliked, in which God plans or designs the universe and then proceeds to carry out his plan. Further, as we have seen, the individual human *psyché* at its highest is an inhabitant of the world of *nous* and thinks intuitively, not discursively. The position is complicated here by the fact that *nous* in the individual *psyché* is several times referred to, which is distinct from the hypostasis *nous* but functions in harmony with and is illuminated by it; and probably, by the

dependence of the individual human *psyché* on an individual *nous*-form which is a full member of the intelligible world, being a Platonic Idea in *nous*.<sup>11</sup> There are even a couple of passages where *psyché* and its characteristic activity of discursive reason seem in danger of being "squeezed out" altogether and the intelligible and sensible worlds and intuition and sense perception left immediately juxtaposed (V.8 [31].7; VI.7 [38].7.29-31). Plotinus never seems very enthusiastic about discursive reason (*dianoia*) though he admits its necessity and place in the hierarchy of mental activities. Finally, *nous* itself becomes at times curiously "psychic." The distinction between the two hypostases is never simply one between the static and the mobile. The eternal being of *nous* seethes with the intensest and most vivid life and movement (see especially V.8 [31].3-4 and VI.7 [38].1-15). And it is not quite as easy as the "official" scheme and tidy-minded accounts of Plotinus's thought might suggest always to distinguish noetic and psychic activity as "eternal" (in any generally accepted meaning of eternity) and "temporal" respectively.<sup>12</sup> There are times when the Plotinian interpreter feels that Plotinus might have managed better if he had abandoned the distinction between the two hypostases which he derived from the Aristotelianized Platonism of some of his predecessors and returned to something more like the authentic position of Plato, with *nous* as the highest, divine or godlike function of *psyché* (to discuss the reasons why he did not do so would take us too far from our subject here). This tendency of higher *psyché* to fuse with *nous* may mean that we shall have to take both into account in our comparison with *buddhi*.

### Conclusion

Similarity between the *Bhagavadgītā* and the *Enneads* is striking as far as the general movement of the self (*autos*) is concerned, from its being centered in the ego, with a disintegrated preoccupation with particular needs and desires of one's lower nature, to being centered in the One or Kṛṣṇa.

However, there are significant differences between them in the demarcation of the various parts of a human being and the emphasis placed on different methods of integration and transformation.

*Psyché* in the *Enneads* ranges over the entire lower nature of Kṛṣṇa and does not correspond exactly to *buddhi* alone which is only a part of *prakṛti*, albeit the highest. In the *Gītā*, discursive thought does not occupy a significant place in the attainment of *jñāna* or true knowledge. *Manas* is considered one of the senses, although it can control other senses when it is functioning properly. The fickleness, unreliability and limitations of *manas* are strongly noted. In the higher, contemplative intelligence of *buddhi*,<sup>13</sup> *manas* ceases its activity and is quietened, so that a vision of the transcendent realm may be possible. On the other hand, discursive reasoning is the characteristic activity of *psyché*. The relationship between *manas* and *buddhi* sometimes looks like that between the "middle" part of the human *psyché*, and the higher part which is eternally in touch with, and an inhabitant of, the world of *nous*. Plotinus does not stress the unreliability of discursive thought as much as the *Gītā* does of *manas*. Nevertheless, Plotinus himself seems to have had much less use for analytical reasoning than might be supposed. Cosmic and divine *psychai* do not think discursively, or deliberate or plan in carrying out their creative and ruling activities. And human *psyché* at its highest can and should think and act like them. Plotinus often seems to be making great efforts (especially in V.8 and early chapters of VI.7) to get his readers to think "noetically," not "dianoetically" or discursively about *nous*. This is possible because our higher *psyché* does not "come down" and can be brought to see *nous* in the proper way "from the inside" and as *nous* itself (VI.7.15, end). There is a striking likeness between the meaning of the root *budh* and Plotinus's repeated exhortations to wake up and realize who we really are and where we belong. This realization of our true nature, which is *jñāna* and *nous* both, is not an outcome

of discursive thought either in the *Bhagavadgītā* or in the *Enneads*.

However, *buddhi*, unlike the higher part of human *psyché*, can be disintegrated, distracted and dispersed. It needs to be purified and trained. The higher *psyché*, on the other hand, does not descend; what we have to do is to become aware of it and let it direct us. (This is not easy!) At this point the *Gītā* is closer to the later pagan Neoplatonists after Iamblichus as well as the main Judaeo-Christian tradition. But higher and middle *psyché* together are like *buddhi* the means of control of what is below them. Besides, higher *psyché*, like *buddhi*, is our "lookout" on the higher world.<sup>14</sup> Roughly speaking we could say that the unintegrated *buddhi* corresponds to the middle *psyché*, which can be attracted upwards or downwards, and the purified and integrated *buddhi* corresponds to the higher *psyché*, attuned to the *nous*.<sup>15</sup>

*Nous* corresponds fairly well to the higher self of man, namely *ātman-puruṣa-brahman*. What is said of the man who has become *brahman* agrees almost exactly with what Plotinus says about the man who has become *nous*. And a man becomes *brahman* or *nous* because he always was so. It is only that now he realizes it; this seeing or realizing is the same as becoming it. Further, *jñāna* is the sort of knowledge *nous* has and we have in it.

The line of demarcation between the hypostases of *psyché* and *nous* is vaguer and more variable in the *Enneads* than that between *buddhi* and *brahman* in the *Gītā*. However, even in the latter, there are considerable variations: *ātman-puruṣa-brahman* is sometimes imperishable, wholly transcendent and unmanifested; sometimes it is perishable and unmanifested; sometimes it appears entangled with *prakṛti*. It is likely, as said both by Plotinus and Kṛṣṇa, that these distinctions in the level of being are too subtle to be grasped without the eye of *nous* or *jñāna*. One can truly see *nous* or *brahman* (which is the object of *jñāna*) only by becoming *nous* or *brahman*.

In addition to *jñāna yoga*, three other types of *yoga*, namely *dhyāna yoga*, *bhakti yoga* and *karma yoga*, constitute the four limbs of the *buddhi yoga* of the *Bhagavadgītā*. We have already said a little about the counterpart of *jñāna yoga* in Plotinus. As far as *dhyāna yoga*, namely the *yoga* of meditation, and the concomitant physical postures are concerned, there are no traces of these in the *Enneads*. Indeed it is difficult to discover them in any pagan Greek philosopher. The later pagan Neoplatonists may have practised something of the sort but the evidence is not at all clear.<sup>16</sup> The *Gītā* is here closer, and the other Indian traditions which have further developed *dhyāna yoga* perhaps closer still, to the monastic and non-monastic Eastern- and Western-Christian traditions of "methods of prayer."

Although Kṛṣṇa is beyond being and non-being, beyond personal or non-personal existence, one of the *yogas* he recommends is *bhakti yoga*, the *yoga* of love and dedication to him. It has often been remarked that a sense of pious devotion to a personal God is missing in Plotinus. This may be true at the level of lower *bhakti* which is little more than conventional piety directed to God. But we wonder if it is true at the level of higher *bhakti*, which is a way, perhaps the way, of coming to know the essence of Kṛṣṇa and uniting with him (*B.G.* 18.54-55). There is the most intense love (*eros*) of the Good, given by the Good, running through the whole *Enneads*. And though the Good is neither personal nor impersonal, the final union is often described in personal terms.<sup>17</sup>

For both the *Gītā* and Plotinus *prakṛti* is good and real, in its own degree. The Platonist will miss in the *Gītā* what is central to all forms of Platonism, the conviction that the lower world is the image of what is beyond. This relation of image to archetype may sometimes mean that the lower world of *prakṛti* is relatively spectral, inauthentic and inferior. But it may also mean that the two worlds are brought very close together, so that the world of *nous* is seen as an inner world

rather than another world, as this world glorified and apprehended *sub specie aeternitatis*. This is very evident in the great descriptions of *nous* in V.8, 3-4 and VI.7, 1-15. These passages seem to be based on direct experience, where dialectic passes beyond itself into vision.

However, both the *Gītā* and Plotinus are basically concerned with what is beyond *prakṛti* and therefore beyond action and becoming. Still, work in *prakṛti* is necessary, and inaction is no way to go beyond action. Action according to one's *dharma*, based on one's own essential nature (*svabhāva*), is certainly more emphasised in the *Gītā*. This, however, may simply be due to the fact that the *Gītā* is intending to deal with a more absolute sort of inaction and withdrawal from the world than any Greek seeker of truth ever practised.

If a person takes Kṛṣṇa's *buddhi yoga* seriously, he must above all attempt to wake up to his own indwelling essential nature, his *svabhāva*, and act out the law of his inner being, his *svadharma*, with a resolute and a quiet mind, without self-pity or self-importance. Arjuna's way was that of a warrior, Plotinus's that of a teacher and a spiritual leader. Each acted out his *svadharma* admirably. The *Gītā* stresses the importance of discovering and living by one's own *dharma* and not someone else's. Śaṅkara and Rāmānuja, following their *dharma*, wrote and taught like Plotinus. And other Platonists of late antiquity understood their *svadharma* differently from Plotinus, for example, the nearest equivalent to Arjuna in the history of pagan Platonism, the Emperor Julian.

#### NOTES

1. For the thesis that the root meaning of *dharma*, as the upholding of the orderly relatedness of all that is, as established in the *Rg Veda*s, the most ancient *śruti* text, has a demonstratable continuity in the *Bhagavadgītā*, see P. W. R. Bowlby, "The Lotus and the

Chariot: A Study of the Root Meaning of Dharma in the Indian Religious Tradition" (Ph.D. Thesis, McMaster University, London, Ontario, 1975).

2. In the religious traditions of India, there seems to be a consensus that the root cause of human bondage and suffering is ignorance, and that what is needed is true knowledge; action is not generally stressed as an avenue to freedom. In the Judeo-Christian traditions, on the other hand, the mainstream emphasis is less on knowing reality; truth has been revealed, the challenge for man is whether he can act according to the revelation and gain salvation. The *Gītā* imbues *buddhi* with both discernment and will. Its teaching and setting insist that right knowledge and right action are inseparable.
3. In addition to the ordinary meaning of *puruṣa* as man, there are three distinct kinds of *puruṣa* mentioned in the *Gītā* (15.16-19): the perishable *puruṣa*, the imperishable *puruṣa*, and *puruṣottama*—highest *puruṣa* who is other than these both and is also called *paramātmā*, the supreme self. Kṛṣṇa declares himself to be *puruṣottama* which does not exclude his being the other *puruṣas* as well; they are also his and they are in him, but he is still beyond. Similarly, in addition to *puruṣa*, other labels referring to the constituents of the higher nature of Kṛṣṇa, namely *brahman* and *ātman*, also have further divisions. These, however, need not be distinguished for our purposes here.
4. It is the same word from which Japanese *zen* is derived by a phonetic shift, through the Chinese *tchan*. *Dhyāna yoga* is also sometimes called *rāja yoga* (royal *yoga*), although *rāja yoga* is not any specific kind of *yoga*; it is *yoga per se*.
5. The various Indian schools of religious thought and practise, before, after and contemporaneous with the *Gītā*, seem to have shown a distinct preference for one or the other of these *yogas*. In the process they usually became one-sided and lost the wholeness of spiritual life and the organic balance and tension characteristic of the *Gītā*. Kṛṣṇa himself says that he taught his eternal *yoga*, which is a supreme secret, to Vivasvat, a sun god, who taught it to Manu, the first among humans. Taught from one to another, this *yoga* was known by sage-kings; but with the lapse of time this teaching was lost on earth (*B.G.* 4.1-3). Kṛṣṇa then taught this *yoga* to Arjuna. The merciless time has undoubtedly again done its damage.
6. The best detailed studies of *psyché* in Plotinus at present available are those by H. J. Blumenthal, *Plotinus's Psychology* (The Hague, 1971), and the two papers, "Soul, World-Soul and Individual Soul in Plotinus," in *Le Neoplatonisme* (Paris, 1971), pp. 56-63, and "Nous and Soul in Plotinus: Some Problems of Demarcation," in

*Plotino e il Neoplatonismo* (Rome, 1974), pp. 203-19. The full commentary by R. T. Wallis on the Fourth *Ennead* (which is entirely concerned with *psyché*) will be of the greatest value.

7. Porphyry, *Life of Plotinus*, Ch. 8.
8. On this see G. O'Daly, *Plotinus's Philosophy of the Self* (Shannon, Ireland, 1973).
9. It is perhaps important to remark here that, though Plotinus writes a great deal about the *spoudaios*, the perfectly wise and good man, the Sage or *Mahatma*, in the *Enneads*, there is no evidence in the *Enneads* or Porphyry's biography that he himself claimed to have attained this perfection, any more than any other great Greek philosopher. They all thought of themselves as *philosophoi* rather than *sophoi*. It was their disciples, like Porphyry, who thought of them as Sages.
10. At this point we depend very much on H. J. Blumenthal's second article (see n. 6). See also, for what might be called "*psyché*-like" characteristics of *nous*, A. H. Armstrong, "Eternity, Life and Movement in Plotinus's Accounts of *Nous*," in *Le Neoplatonisme* (see same note), pp. 67-76, which Blumenthal at some points constructively criticizes. Much further work is in progress about the problems raised in this paper.
11. This is a much disputed question. Reasons for the view adopted here (with an account of previous discussions) are included in a lecture, "Form, Individual and Person in Plotinus," reprinted in A. H. Armstrong, *Plotinian and Christian Studies* (London: Variorum Reprints, 1979), chap. XX.
12. On this see Blumenthal's and A. H. Armstrong's articles cited in n. 10. There are plenty more to come, notably from Dr. Peter Manchester.
13. *Buddhi* is traditionally located in the heart rather than the head. Although this is not specifically mentioned in the *Gītā* with respect to *buddhi*, Kṛṣṇa declares himself to be located in the heart of every being. On the other hand, Platonists were rather peculiar among Greek philosophers in making the brain the organ of intelligence. The traditional seat of all thought for Greeks was in the heart (or earlier the *phrenes*, the diaphragm and the organs above it) and Aristotelians and Stoics maintained this position. Plato had placed intelligence in the head for symbolic reasons in the *Timaeus*, and the nobler passions in the heart, and later Platonists like Plotinus thought that the Master's doctrine had been confirmed by the discovery of the nervous system by Erasistratus and Herophilus in the 3rd century B.C., whose discovery had been restated and made widely known by Galen in the 2nd century A.D. See Plotinus IV.3

- [27].23.9-21, and A. H. Armstrong, ad. loc., in the Loeb *Plotinus*, Vol. IV.
14. Cosmic and divine *psychai* are altogether of the higher world; intuitive, unchanging, infallible and impeccable.
  15. This was the guess made by one of us in a footnote a few years ago. See R. Ravindra, "Self-Surrender: The Core of Spiritual Life," in *Studies in Religion* (Spring, 1974). On *psyché* and self (*autos*) see G. O'Daly, *Plotinus's Philosophy of the Self* (Irish University Press, 1973).
  16. See A. Smith, *Porphyrus's Place in the Neoplatonic Tradition* (The Hague, 1974), pp. 97 ff. and 115 ff.
  17. This whole question of love for God, and also God's love for man, in the *Enneads* and the *Bhagavadgītā* is very important. However, we cannot dwell on it here any longer without being sidetracked from the subject of this paper.

## The Plotinian One and the Concept of *Paramapurusa* in the *Bhagavadgītā*

---

I. C. Sharma

Cleveland State University  
Cleveland, Ohio

Plotinus was essentially a mystic philosopher. It is therefore important that his original contribution be kept apart from the external influence on his thought. He no doubt studied Plato and other earlier philosophers, but his reference to them in his work aimed at clarification, elucidation, and confirmation of his own vision and experience. Any examination of his concepts without reference to the mystical experience, which is the core of his philosophy, is a misinterpretation, if not a distortion. Elmer O'Brien, in his work *The Essential Plotinus*, has committed this fallacy in saying that the historical approach is necessary. Even though he agrees that Plotinus never knew the writings of Philo, yet he imagines that the Plotinian One is the expression of Plotinus's own mystical experience arrived at through contemplation or meditation. O'Brien, a typical historian of philosophy, further comments that Plotinus's meditation shows the influence of Plato. Supporting this contention, he cites Porphyry:

First published in *Ohio Journal of Religious Studies* 6 (April 1978): 3-12.

Porphyry again is our informant that it was by meditation and by the method that Plato teaches in the Banquet that Plotinus "lifted himself . . . to the first and all-transcendent divinity." The reference is to the passage wherein Socrates retails the words of Diotima, the wise woman of Mantinea. The method taught there is that of a twofold purgation of the mind, one qualitative, the other, quantitative.<sup>1</sup>

Even if we were to accept that Plotinus borrowed contemplative method from Plato, the experience that he had was that of the Transcendent One and was his own VISION OF THE TRUTH. Moreover, the meaning of contemplation as understood by Plotinus is different from that which is foisted on him by critics like O'Brien.

It seems important to clarify the meaning of contemplation with reference to Plotinian philosophy. Contemplation as meditation in Plotinus, leading to the experience of the One through Intelligence, bears a strong parallel to its meaning and significance in the *Bhagavadgītā*. The thought of the *Bhagavadgītā* is no doubt a philosophical exposition of the mystic experience of *Paramapurusa*—the Supreme Self—the One, which is both immanent and transcendent. This immanence of the Transcendent One has been recognized by Plotinus in the eighth chapter of the third *Ennead*. There he states that even nature contemplates. It should be remembered that the only way of being aware of the One, according to Plotinus, whether on the part of the individual soul or the World Soul or the Intelligence (Nous), is contemplation. The *Bhagavadgītā* consistently advocates contemplation (*Yoga*) as the sole means of attaining the Supreme Self (*Paramapurusa*). The *Gītā* is older chronologically than the *Enneads* and propounds the manifestation of the World Soul, the Individual Souls, and the Nous or the Intelligence which is designated as *Aksara* or the Indestructible *Puruṣa*. Nature, *Prakṛti* in the *Bhagavadgītā*, stands for the material creation as well as the divine Energy which is immanent in nature. The highest forms of natural

manifestations have been mentioned in the *Gītā* as objects worthy of contemplation for spiritual realization. Having attained identification with *Paramapurusa*, Kṛṣṇa says to Arjuna:

In my unmanifested form I am irmanent in the entire creation. Everything rests in Me, but I am not in them.<sup>2</sup>

This immanence of the Transcendent One in nature has been described by Plotinus as well:

That [which] is called nature is a soul, the offspring of a superior soul with a stronger life; that it quietly holds contemplation in itself, not directed upwards or even downwards, but at rest in what it is, in its own repose and a kind of self perception, and in this consciousness and self perception it sees that what comes after it, as far as it can, and seeks no longer, but has accomplished a vision of splendour and delight.<sup>3</sup>

Although Plotinus places contemplation before the attainment of mystic experience as an intellectual means to the end of understanding the One, yet in essence and in effect contemplation is the same thing as the *Yoga* of the *Bhagavadgītā*. Later we shall show how the *Buddhi Yoga*, or the *Yoga* of the Intellect, has been regarded as the highest in the *Gītā*. However, it is important to give the meaning of this term in Sanskrit. This word was derived from the root *Yuj*, which means "to unite" or "join." When we unite ourselves with the Source, the Goal, the One, we are said to be in *Yoga* or in contemplation. Thus *Yoga* is the means of the union of the soul with the One as a technique, and it is also the state of that union itself. This union is the main theme of the *Bhagavadgītā*. At the end of every chapter recurs the statement that the *Bhagavadgītā* is a *Yoga Shastra* or the science of *Yoga*.

As a technique *Yoga* is an activity, and, most accurately, it

is the highest activity of the intellect or the *Buddhi*. As a state of mind, *Yoga* is an attainment of the highest mystical experience which a *Yogin* or contemplator can ever achieve. In this state the *Yogi* may be outwardly inactive because he becomes the source of all activity. But it must be remembered that without the highest intellectual activity no *Yoga* is possible. According to the *Bhagavadgītā*, *Yoga* means efficiency in activity (*Yoga Karmasu Kauśalam*). In this sense, the entire creation has been designated as the *Yogamāyā* or the Creative Energy of the *Paramapurusa*. It has also been referred to as the *Līlā* or the play of God. Plotinus as well talks about play in reference to contemplation. In the *Upaniṣads*, which are the warp and woof of the philosophy of the *Bhagavadgītā*, creation is the play of *Brahman*, the Supreme Being.

The *Vedas*, which include the Brāhmaṇic and the Upaniṣadic literature, propound the fourfold aspects of *Brahman*:

1. *Avyaya Brahman*—Infinite Beyond, Beyond Being, without any qualifications, not even One (because One is a limitation);
2. *Akṣara Brahman*—Indestructible One, the Ultimate Cause, not yet differentiated from Pure Existence;
3. *Ātmakṣara Brahman*—The Cosmic Self with the potentialities of creation, preservation, and destruction, not yet manifested in Cosmic Creation; as such *Brahman* is the Creator in the same sense *Nous* is;
4. *Viśvasṛit Brahman* the Projection of the *Ātmakṣara* into the entire creation of time, space, causality. As such *Brahman* is the Cosmic Form—the World Soul. This fourth is also called *Virāt Puruṣa*.

The first three aspects of *Brahman* are transcendent, but all three combined are immanent in the World Soul and in the Cosmos consisting of material nature and the individuated souls. The entire creation is the play of just one part of the Cosmic Self which should, in fact, be called Acosmic Self. The ground, the cause, and the creator, which as transcendent realities are 'beyond' the cosmos, combined 'partially' in the

manifested World Soul, are 'immanent' in the spatio-temporal world. This is the basic metaphysics of the *Vedas*, which the philosophy of the *Bhagavadgītā* attempts to explain throughout. Before elaborating on the comparative analysis of the concepts of the Plotinian One and the *Paramapurusa*, let us consider the relationship of play with contemplation as Plotinus sees it:

Well, as the discussion has arisen among ourselves, there will be no risk in playing with our ideas. Then are we now contemplating as we play? Yes, we and all who play are doing this, or at any rate this is what they aspire to as they play. And it is likely that, whether a child or a man is playing or being serious, one plays and the other is serious for the sake of contemplation; and every action is a serious effort towards contemplation; compulsory action draws contemplation more towards the outer world, and what we call voluntary action, less, but all the same, voluntary action, too, springs from desire of contemplation. . . . Let us now talk about the earth itself, the trees, and plants in general, and ask what their contemplation is, and how we can relate what the earth makes and produces to its activity of contemplation, and how nature, which people say has no power of forming mental images or reasoning, has contemplation in itself and makes what it makes by contemplation, which it does not have.<sup>4</sup>

This paragraph especially needs the attention of those who consider Plotinian contemplation merely as empirically intellectual and dialectically discursive.

Our study reveals that contemplation, *Yoga*, and mystic experience are to be understood in the same sense. The philosophy of the *Bhagavadgītā* is the outcome of the mystic experience of the Vedic and Upaniṣadic sages, re-affirmed by the self-realization of the king of the mystics, Yogirāj Śrī

Kṛṣṇa, who declared the *Yoga* of Intelligence to be the integrated *Yoga*.

Since *Yoga* means "union with the One," the entire *Bhagavadgītā* expounds this union in every chapter, each one of which is a *Yoga* of one kind or another. The emphasis of Plotinus on contemplation is parallel to the concept and understanding of the *Paramapurusa* through *Buddhi Yoga* in the *Bhagavadgītā*.

We can throw more light on the comparison by analyzing the nature of God as accepted in the *Gītā*. The analysis presented here, based as it is on Brahmanic literature, is different from sectarian interpretations of the *Gītā*. The sources of this analysis have not yet been published in the English language. All the commentaries on the *Bhagavadgītā*, including that of Śaṅkarācārya, brought to the West by scholars like Radhakrishnan, have generally overlooked the fact that the metaphysics of the *Gītā* is the same as that of the *Vedas* so far as the concept of God is concerned. The concept of *Brahman*, with its four aspects as stated above, is basic for understanding the peculiar nature of *Māyā* as Creative Energy and as an emanation from *Paramapurusa*. A lack of understanding of *Māyā*, caused by their not referring to the Vedic literature, has been responsible for the conflicting conclusions arrived at in different sectarian interpretations.

It has already been stated that the nature of the *Brahman* is fourfold. The *Avyaya Brahman*, the Infinite Ground, the nameless, is the highest and is parallel to the One of Plotinus, when he calls it "beyond all names." The *Akṣara* or the Indestructible Absolute may correspond to the good and sometimes to the One of Plotinus. The *Ātmakṣara* corresponds to the Nous and the *Viśvasṛiṭ*, or the Immanent *Brahman*, manifested in the entire spatio-temporal cosmos and yet beyond it, corresponds to the World Soul of Plotinus.

By referring to this fourfold nature of *Brahman* we see that the *Bhagavadgītā* is the science of *Yoga*, as it is stated at the end of every chapter. In the words of Plotinus, we could call

it the science of contemplation on the One. The above interpretation of the *Bhagavadgītā* has been given by two great contemporary Orientalists, Śrī Madhusudan Ojha and his pupil, Śrī Motilal Shastri, neither of whom knew the English language. The two works of these great scholars, *Brahman Vijñāna, the Science of Brahman*, by Ojha, and *Gītā Vijñāna Bhāṣya, the Commentary on the Science of the Bhagavadgītā*, by Shastri, are perhaps the two most monumental works ever published in the Hindi language.

According to Motilal Shastri, the *Bhagavadgītā* as *Yogashāstra* is a most valuable dictionary of the *Jñāna* (comprehensive knowledge) and *Vijñāna* (scientific knowledge) of India. It may be called the index of the definitive terms used in the science of the *Vedas* from the point of view of comprehensive and scientific knowledge. (For the sake of accuracy, I use the terms *Jñāna* and *Vijñāna* instead of their English versions.)

These words have been used in the same senses in the *Bhagavadgītā*. The significance of these terms is so great that the seventh chapter of the *Gītā* is entitled "Jñāna Vijñāna Yoga." Similar is the significance of the words *Akṣara Brahman*; the eighth chapter is entitled "Akṣara Brahman Yoga." The concept of *Paramapurusa*, which is closely connected with these two chapters, is explained in the fifteenth chapter, entitled "Puruṣottama Yoga" (*Puruṣottama* is a synonym for *Paramapurusa*). It is therefore important to clarify the terms *Jñāna* and *Vijñāna* in the present context.

In the *Vedas* there are two independent subjects, *Brahman* and *Yajña*. The word *Yajña* has been poorly translated as "sacrifice." Thus, there are two types of definitions of technical terms in the *Vedas*: (1) Definitions which analyze or explain *Brahman* (the One) as a reality; and (2) those which explain *Yajña* (the pluralistic evolution or expansion) as the reality. Unitive *Brahman* comprehensively knowable as One through *Jñāna* has been accepted as the ground and foundation of pluralistic *Yajña* knowable through *Vijñāna*. In the words of Śatapatha Brāhmaṇa: "brahma vai sarvasya pratiṣṭha" (*Brahman* is the ground of all existence).<sup>5</sup>

This is in fact what is called the eternal natural divine *Yajña*. According to the *Vedas* this pluralistic, scientifically analyzable, and knowable cosmos has evolved from and is grounded in that *Brahman* which is knowable as One through *Jñāna*.<sup>6</sup> Thus *Jñāna* (the unitive knowledge of the One) and *Vijñāna* (the pluralistic knowledge of the manifold cosmos) are significant because they presume the metaphysics of the fourfold *Brahman*.

Since the seventh chapter of the *Bhagavadgītā* is devoted entirely to these two terms, it is evident that the metaphysical and the cosmological assumptions of this work are Vedic. In the seventh chapter of the *Gītā*, Śrī Kṛṣṇa says:

I will explain to you the reality in detail through the methods of unitive knowledge, *Jñāna* and divisive science, *Vijñāna*, having understood which nothing else remains to be known.<sup>7</sup>

It is needless to emphasize the significance of this verse in the face of the facts stated above. Almost all the sectarian and uninformed translations of the *Gītā* have neglected the significance of *Jñā*, which refers to the acceptance of the One, the *Paramapuruṣa*, who as immanent of the World Soul is called *Puruṣa* only, and, as the transcendent indestructible Absolute, is called *Akṣara* as well as Beyond, Beyond One. Similarly, the significance of divisive scientific knowledge of the pluralistic spatio-temporal cosmos has been overlooked. The pluralistic manifold material nature is described in this very chapter and designated *Aparā Prakṛti* or inferior nature. The individual souls are called *Parā Prakṛti* or superior spiritual nature, which is the ground of the weaker or inferior material nature. Plotinus, too, explains matter as privation and as weaker emanation of the One in the same strain.

According to the *Bhagavadgītā*, the immanent World Soul, *Puruṣa*, itself is rooted in *Paramapuruṣa* (Nous according to Plotinus). However, *Paramapuruṣa* as transcendent is beyond Nous as well. The World Soul is the source of individual souls

or of life. In this sense, the One is the beginning as well as the end of all beings. All beings are strung on it as beads are strung on a thread. The sixth and seventh verses of the seventh chapter read:

I am both the origin and dissolution of all the material and spiritual beings. O' Arjuna, there is no being superior to Me; everything is rooted or strung in Me as the pearls are strung on a thread.<sup>8</sup>

In these verses the material nature and the individual souls, as well as the World Soul immanent in the cosmos, are associated with *Paramapuruṣa*, who is the Supreme Self beyond all distinctions, and as such is the One.

The Plotinian notion of the One is a similar "unity in diversity." In the sixth *Ennead* Plotinus says:

As the One does not contain any difference, it is always present and we are present to it, when we no longer contain difference. The One does not aspire to us, to move around us; we aspire to it, to move around it. Actually, we always move around it, but we do not always look... we are always around The One. If we were not, we would dissolve and cease to exist. Yet our gaze does not remain fixed upon The One. When we look at it, we then attain the end of our desires and find rest. Then it is that, all discord passed, we dance an inspired dance around it.

In this dance the soul looks upon the source of life, the source of The Intelligence, the origin of Being, the cause of the Good, the root of The Soul.<sup>9</sup>

The last paragraph here is almost a paraphrase of the fourfold nature between *Brahman* or *Paramapuruṣa*. It points out the relation between the individual souls, including all natural life, (*Viśvaśrit*), the Nous (*Ātmakṣara*) and the One which also is referred to as the Good. It has already been stated that

*Brahman* as ground is the Beyond and *Brahman* as the One Indestructible is the Cause. The One of Plotinus is sometimes the *Brahman* as the ground and sometimes the *Brahman* depending on the context in which he uses the term.

*Brahman* as the ground is indefinable. In the *Upaniṣads* it has been called the transcendent Being which is indescribable, *Anirvacanīya*. The sages have tried to describe it in negative terms, "Neti, Neti"—not this, not that. Plotinus follows the same methods when he says:

The awesome existent above, The One, is not a being for then its unity would repose in another than itself. There is no name that suits it, really. But, since name it we must, it may appropriately be called 'One', on the understanding, however, that it is not a substance that possesses unity only as an attribute. So, the strictly nameless, it is difficult to know. The best approach is through its offspring, Being: we know it brings The Intelligence into existence, that it is the source of all that is best, the self-sufficing and unflagging begetter of every being, to be numbered among none of them since it is their prior.<sup>10</sup>

Plotinus tries to point out that the One, the transcendent in the sense of being prior to the Good, the Intelligence, the Soul, and the material nature, is yet the begetter of its entire offspring. He arrives at this conclusion and understanding through contemplation. The *Bhagavadgītā* aims at the understanding of the same One, the *Paramapurusa*, as One who knows everything, who is the oldest, who is the controller, who is smaller than the smallest, who is the sustainer of everything, who is beyond material conception, who is unthinkable, who is luminous like the sun, who is beyond material nature and is transcendent.<sup>11</sup>

The same transcendent One pervades the universe and is eternal. Clarifying this aspect of the One, Śrī Kṛṣṇa says:

Remember that Being is eternal and true  
Which pervades everywhere and manifests too:  
No one can ever annihilate  
That Being Immortal Indivisible and Great.<sup>12</sup>

Since man is regarded as miniature *Brahman*, the *Bhagavad-gītā*, like the *Vedas*, accepts that the totality of man is constituted by the body, the mind, the intellect, and the soul, corresponding to the manifested World Soul in the form of the cosmos, the cosmic Self as the potential Creator, the indestructible One as the cause, and the infinite beyond Being, as the ground. Thus the real soul is beyond senses, beyond mind, and beyond intellect. Referring to this definition of soul (which has incidentally been accepted by Plato as well), the *Bhagavadgītā* says:

Senses are of subtle kind,  
Subtler than senses is mind;  
Subtler than mind is intellect great;  
Soul is beyond intellectual state.<sup>13</sup>

The word "God" in the *Bhagavadgītā* is not used in an anthropomorphic sense. It is used in the Vedic and *Upaniṣadic* sense as *Īśa* (Immanent), *Sarvajña* (Omniscient), *Parah Puruṣa* (Beyond Being), etc. The fifteenth chapter, "The Yoga of *Puruṣottama* or *Paramapurusa*," has great significance from this point of view. It points out that all three transcendental aspects of *Brahman*, the Ground, the Cause, and the Creator, are present in the cosmos as material destructible nature called *Kṣara Puruṣa*, the indestructible *Akṣara Puruṣa* in the form of spiritual nature, and *Uttama Puruṣa* in the form of the Ultimate Soul (*Paramātmā*). This has been clarified in the following verses of the fifteenth discourse:

There are two *Puruṣas* in the cosmos, viz: *Kṣara*, the material nature, and *Akṣara*, the spiritual nature; all the material as well as the spiritual beings are contingent so far as their manifestation is concerned.

They are therefore *Kṣara Puruṣa*. The immanent unitive Soul is the indestructible *Aksara Puruṣa*. There is the other Supreme Self, *Uttama Puruṣa* (*Paramapuruṣa*), the Excellent Self, who has been called the Ultimate Soul, who is Infinite and who, having entered the three dimensional cosmos of space, time, and causality, sustains all existence.<sup>14</sup>

This description of the Immanent Ultimate Soul fits quite well with Plotinus's description of the Soul. The Soul as participant unity, *Visva Srit*, the Ultimate Soul within the cosmos, has been construed in the *Bhagavadgītā* as the presence of the One and has been called *Paramapuruṣa* as well as *Paramātmā* (Ultimate Soul). Plotinus points out that the unity of the Soul is derived from another source (the One). In fact, although the expression is different, the truth expressed by Plotinus and by the *Bhagavadgītā* is the same. In the words of Plotinus:

The Soul, while distinct from The One, has greater unity because it has a higher degree of being. It is not The One. It is one, but its unity is contingent. Between The Soul and its unity there is the same difference as between body and body's unity. Looser aggregates, such as a choir, are furthest from unity; the more compact are the nearer; The Soul is nearer still, yet—as all the others—is only a participant in unity.<sup>15</sup>

To sum up, the Plotinian concept of the One and that of the *Paramapuruṣa* are methodologically and metaphysically the same. Many Western thinkers have said that Plotinus's approach is psychological. The truth is that it is contemplative, Yogic, and intellectually mystic. He uses the word "Intelligence" in a sense which is not common. Intelligence, according to both Plotinus and the *Gītā*, is next to the One. In man, it is next to soul. Though the One is beyond Intelligence, yet it is closest to the latter. Both Plotinus and the

*Bhagavadgītā* are metaphysically monistic and methodologically contemplative and ethical. A deeper study of the *Yoga* of the *Bhagavadgītā* shows that the method of *Yoga* which brings union of the soul with the One is not limited to the path of knowledge, the path of selfless action, and the path of love or devotion. There is the fourth and highest path called *Buddhi Yoga*, the path of Intelligence, which in fact is the essence of the philosophy of the *Gītā*, Śrī Kṛṣṇa has emphatically stated that the *Buddhi Yoga* is the highest and most efficacious path, because it is all inclusive. It is the sum and substance of the *Bhagavadgītā*, both as a metaphysical exposition and as the science of *Yoga*. The *Buddhi Yoga* is a golden mean between the two extremes of asceticism and unrestrained indulgence in sensuous satisfaction. So is the philosophy of Plotinus.

This comparative study reveals that mystic experience is not antagonistic to practical life. Intelligence being nearest the One, the way to the mystic experience of oneness is via Intellect. Thus contemplation in the *Buddhi Yoga* and in Plotinus justifiably brings about the union of the empirical and the mystical, the psychological and the logical, the metaphysical and the ethical aspects of philosophy.

## Phraseology and Imagery in Plotinus and Indian Thought

---

Richard T. Wallis

*University of Oklahoma  
Norman, Oklahoma*

The existence of significant resemblances between Neoplatonism and Indian thought,<sup>1</sup> despite the presence of perhaps equally important divergences between them,<sup>2</sup> can hardly be questioned; it is, indeed, a necessary presupposition of this colloquium. The question that naturally arises is whether we have to do with mere parallels between them, or whether one culture is borrowing from the other, and, if so, which is the borrower. The existence of abundant opportunities for cultural contact between the two civilizations both before and during the Neoplatonic period does not guarantee that borrowing actually took place, since equally impressive parallels can be found in cases where only the most foolhardy scholar would accept the existence of contact; Dr. Joseph Needham, for instance, observes significant resemblances between fifth and fourth century B.C. Greek scientific theories, notably in Aristotle's biology, and almost contemporary Chinese developments.<sup>3</sup> It may be, therefore, that we must rest content with tracing the similarities and differences between the two traditions and leave the question of cultural contacts unresolved.

Moreover, as Dr. Conze observes, after noting the resemblances between Judeo-Greek and Indian ideas on wisdom, to explain these by "borrowing" ignores both the equally important question of the *motive* of the borrower and the fact that the concept of wisdom in both traditions "grew quite naturally out of the preceding tradition, and is in no conflict with any of their basic concepts."<sup>4</sup> Admitting all these cautions, I wish to suggest here a methodology for approaching the question of "influence" and to apply it to one of the parallels which in my view affords the strongest evidence for interaction of ideas, namely Neoplatonic and Indian ideas on divine activity, in particular, the views of Plotinus and those expressed in the Mahāyāna Buddhist work *Uttaratantra* or *Ratnagotravibhāga*.<sup>5</sup>

First of all, in considering possible parallels between two systems of thought, we must examine their nature. We may, first, have to do with parallels of experience, especially, in the case that interests us, of mystical experience. In my paper, presented to the first of these colloquia in 1973, I drew attention to the parallels between the experiences underlying Plotinus's two higher Hypostases and those of Hindu and Buddhist mysticism.<sup>6</sup> The resemblances between the accounts given by the mystics the world over is a commonplace, and while cultural contact may explain some such cases, it is clearly inapplicable to mysticism as a whole. Secondly, there are resemblances of ideas or philosophical theories. These may or may not be concerned with the interpretation of experience; thus in progressing from the "ineffability" of his experience to the construction of a "negative theology" the mystic has already advanced from experience to interpretation, and, to give a more specific case, remarkable parallels exist between Neoplatonic criticisms of the Aristotelian view of Intelligence as the highest hypostasis and the debate between the Mādhyamika and Yogācāra (or Vijñānavāda) schools of Mahāyāna Buddhism over whether the absolute can be described as "thought."<sup>7</sup> Of a more abstract kind are the parallels between the Greek and Indian ideas on reincarnation.

Here we are on more uncertain ground, but must always keep in mind the possibility that we have to deal not with influences, but simply with similar minds viewing the world in similar ways. This is less likely the closer the verbal parallels between the formulation of such theories; in particular, and this brings us to our third class of parallels, significant resemblances between the images used by different authors in illustration of these theories or experiences deserve the closest attention. Even here, whether borrowing is involved is often uncertain, since, whether or not we accept Jung's theory of "archetypes," there is no doubt that certain images tend to occur spontaneously to the human mind. Thus Plato's simile of the sun (*Rep.* VI.507-9) has very definite parallels in Indian religion literature, including the *Uttaratantra*,<sup>8</sup> but there is no doubt that the use of sun and light as symbols of Ultimate Reality and the illumination it affords is a natural one and widespread throughout the world. The same need not, however, apply to all particular applications of the sun simile, and it is from one of these that I propose to start. In line with the methodology proposed above, I shall deal with parallels both of imagery and of conceptual formulation. It is clear from what has already been said that my method involves a large measure of subjectivity. Yet even if I am wrong and we have to do with "parallels" rather than "influences," these are nonetheless of considerable interest. I must finally confess that my knowledge of Indian philosophy is far from complete and my knowledge of Indian languages virtually non-existent, and I hope that others here may be able to supply texts unknown to me to round out my account.

In his famous account of Emanation in *Enn.* V.1.6. Plotinus stresses its spontaneity; the One he declares, produces "without inclination, will or movement," but, while it remains unmoved, a radiation proceeds from it like that of light from the sun.<sup>9</sup> Similarly the modern Hindu sage Ramana Maharshi declares that "not from any desire, resolve or effort on the part of the rising sun, but merely due to the presence of his rays, the lens emits heat, the lotus blossoms, water evaporates

and people attend to their various duties in life. . . . The three-fold activity of creation, preservation and destruction . . . takes place merely due to the unique presence of the supreme Lord. . . . The Lord himself has no resolve; no act or event touches even the fringe of his being. This state of immaculate aloofness can be likened to that of the sun, which is untouched by the activities of life, or to that of the all-pervasive ether, which is not affected by the interaction of the complex qualities of the other four elements."<sup>10</sup> The ether comparison, as we shall see, has an extremely interesting anticipation in the *Bhagavadgītā*,<sup>11</sup> but, for the rest, my knowledge of Hindu philosophy is too scanty for me to know what anticipations of the Maharshi's account of divine activity exist there. Moreover, since the Maharshi had numerous Western disciples, some of whom must have had at least a superficial acquaintance with the *Enneads*, we may wonder whether he could not have derived the idea from them. This need not be so, however, since very precise anticipations thereof exist in Indian thought, namely the Mahāyāna Buddhist conception of the Buddha's activity—the Buddha, at this stage of Buddhist thought, being conceived as a cosmic principle, identical with Ultimate Reality, of which the historical Buddha is a mere appearance. More precisely, he is conceived as having three "bodics," the *Dharmakāya* (identical with Ultimate Reality and sometimes termed the "Cosmical Body"), the *Saṃbhogakāya* (the "Community" or "Bliss Body," the ideal form in which he appears to beings more advanced than ourselves) and the *Nirmāṇakāya* (or "Transformation Body") the phantom body in which he appears on earth. J. Przyluski has noted the obvious resemblance to the Neoplatonists' three Hypostases,<sup>12</sup> but details of the doctrine, especially of the intermediate *Saṃbhogakāya*, are hard to come by, and the sections of the *Uttaratantra* that discuss the *Saṃbhogakāya* show few Neoplatonic affinities.<sup>13</sup> In any case, the parallels with which I shall deal are less controversial.

The account of the Buddha's activity which interests us occupies the fourth chapter of the treatise traditionally entitled *Uttaratantra*, made up of a sequence of verses, ascribed to Maitreyanātha, the founder of the Yogācāra school of Mahāyāna, together with a prose commentary ascribed to his disciple Asaṅga. Maitreyanātha's dates, assuming him to be a historical figure (which is not universally granted), are traditionally given as A.D. 270-350 and Asaṅga is said to have flourished around the latter date.<sup>14</sup> Recent research, however, has identified the work with the *Ratnagotravibhāga* of Sarāmāti (or Sthiramāti), a later Yogācarin commentator, who is generally dated between 350 and 450 A.D.<sup>15</sup> Any of these dates, it will be observed, would make the work post-Plotinian in composition and one is therefore tempted to conclude that, if influence is at work, it is of Neoplatonism upon Buddhism rather than the reverse.<sup>16</sup> Uncertainty is, however, added by the fact that the *Uttaratantra* (as we shall call it for convenience's sake) appeals for authority to various *Sūtras*, or discourses ascribed (mythically, it need hardly be said) to the Buddha.<sup>17</sup> The dating of these texts is even more uncertain than that of the Mahāyāna philosophers, and all that can safely be said is that they must have been composed during the early centuries A.D.<sup>18</sup> Hence uncertainty concerning the origin of the ideas in question must persist.

The sun simile is one of the nine used in the chapter in question to illustrate the view that the Buddha's activity takes place "without effort and uninterruptedly."<sup>19</sup> Or, as the Tibetan writer Gampopa (1079-1153) summarises the doctrine in the final chapter of his *Jewel Ornament of Liberation*, "when a man becomes a Buddha, habit-making thoughts and forced effort cease for him. Therefore, whatever is, or is thought to be, necessary for sentient beings happens all the time of its own accord."<sup>20</sup> Hence, "without effort or discursiveness the Buddha's voice proclaims the Dharma simply because it is good for those so fortunate as to listen to it."<sup>21</sup> In the *Uttaratantra* (IV.61 ff.) the sun simile appears as follows:

IV.61. Warmed by the sun, at one and the same time,  
The lotus flower expands and the Kumuda folds its  
leaves;

But the sun, it has no searching thought  
About the qualities and the defects  
Of the water-born flowers as they open and fold.  
Similar to that is the saint (in his acts).

62. Free from any searching thought,  
The sun, expanding its light, simultaneously,  
everywhere  
Makes the lotus flower unfold its leaves  
And causes to ripen (other kinds of plants).

63. Similar to that is the sun which is the Buddha  
With its rays—the highest of doctrines.  
Free from a searching thought, they are directed  
Upon the concerts resembling lotus flowers.

64. Arising in the leaves of Enlightenment  
As the Cosmical Body and the visible forms,  
The sun of Omniscience casts the rays  
Of divine wisdom over all living beings.<sup>22</sup>

In another simile (IV.56-57) we read:

IV.56. As Brahmā, without moving from his abode,  
In all the regions of the gods  
Demonstrates his apparition without effort.

57. In a similar way, in all the regions of the world  
The Lord, though motionless in his Cosmical Body,  
Shows himself in apparitional forms,  
Without effort to those who are worthy.<sup>23</sup>

In short:

The Buddha does not search, nor does he reflect  
(about the character of the work to be done). How-  
ever, he does act, and this his activity free from

search and reflection manifests itself miraculously  
and without effort."<sup>24</sup>

The Perfect Supreme Buddha is motionless, he does  
not reflect, nor does he speak, nor search, nor inves-  
tigate. He neither searches, nor investigates (the  
past), nor does he reflect (about the present), nor  
has he any thoughts (and desires regarding the  
future)."<sup>25</sup>

V.3. Who and by what means is to be converted,  
What is to be the aim, and at what place and time,—  
Without having any constructive thought regarding  
all of this,  
The sage always acts completely free from effort.

4. Indeed he does not give himself up to thoughts  
As to what may be the constitution of the convert,  
Which of the many means of conversion is to be used,  
Where and when it is to be accomplished, the place,  
and the time."<sup>26</sup>

Similar ideas are expressed at many places throughout the  
treatise.<sup>27</sup>

We thus find that in the *Uttaratantra* the Buddha (a) abides  
unmoved, like the One in Plotinus's account of Emanation  
(the familiar Neoplatonic principle of "undiminished giv-  
ing"<sup>28</sup>); similarly, the Buddha's Cosmical Body is "not sub-  
jected to augmentation and decrease."<sup>29</sup> (b) Secondly, "the  
Buddha acts uninterruptedly, as long as the world exists" and  
"is characterised as neither becoming originated nor disap-  
pearing (anew). Being thus immutable, he cannot be regarded  
as acting (in the ordinary sense)."<sup>30</sup> Similarly in Neoplatonism  
the divine Hypostases' activity constitutes an eternal process,  
like the outflow of light from the heavenly bodies.<sup>31</sup> It fol-  
lows that the *Timaeus*' account of divine deliberation cannot  
be taken literally, since there was no time at which such  
deliberation could have taken place.<sup>32</sup> Hence, in both systems

divine activity proceeds (c) effortlessly and (d) without discursive thought. As Sallustius summarises this teaching, once again introducing the sun simile: <sup>33</sup>

We must consider that the gods bestow all this attention on the universe without any deliberation or toil: just as bodies with a function do what they do merely by existing, as the sun lights and warms merely by existing, in this way and much more so does the providence of the gods benefit its objects without involving toil for itself. Hence the questions of the Epicureans are answered: their contention is that what is divine neither is itself troubled nor troubles others. <sup>34</sup>

As Sallustius goes on to observe, the doctrine of the effortlessness of divine providence constitutes the Neoplatonic answer to Epicurus's objection<sup>35</sup> that exercising providence would be a burden for the gods. That the Hypostases do not deliberate is equally rooted in earlier theological debates. Jean Pépin has well brought out that it was essential to Aristotle's account of deliberation that such a deliberation constitutes a search for knowledge of which one is initially ignorant,<sup>36</sup> and I myself have shown, briefly in my *Neoplatonism*<sup>37</sup> and at greater length in a paper to appear in *Aufstieg und Niedergang Der Römischen Welt* how the Sceptics had turned this point against popular conceptions of divine wisdom.<sup>38</sup> As Plotinus observes, to regard deliberation as essential to divine wisdom confuses the search for wisdom with its actual possession and ranks God with the apprentice rather than the master of an art. For the process of deliberation ceases with the achievement of wisdom, and beings whose wisdom is eternal have no need to resort to it at all.<sup>39</sup> Finally (e) both the Neoplatonists and the *Uttaratantra* agree that divine activity proceeds uninterruptedly and that the variability of its reception by inferior beings is due to their own weakness, not to any change in the illumination bestowed upon them from above.<sup>40</sup>

Leaving the *Uttaratantra* for a moment, I wish to note another remarkable parallel between Plotinus and Buddhist thought, their views concerning the omniscience of the world-soul in the former case, of the Buddha in the latter. As Conze observes, Buddhist scholasticism, while upholding the Buddha's omniscience, normally refrains from delineating the nature of that omniscience too precisely.<sup>41</sup> He notes, however, that Asaṅga's younger brother Vasubandhu in his *Abhidharmakośa*,<sup>42</sup> a work written before Asaṅga converted him to the Mahāyāna and one which forms the most systematic compendium of the philosophy and psychology of the Sarvastivādin School of Hīnayāna Buddhism, expounds the view that "the Buddha knows the future not by inference, or by various portents or omens which allow fortune-tellers to guess it, but by seeing it before his own eyes."<sup>43</sup> Likewise, Plotinus, in refuting any idea of divine deliberation, declares that the world-soul's knowledge is not like that of diviners, but of the man responsible for an action, who has full control over its outcome and therefore no doubts concerning it. Hence the world-soul knows the future, as it knows the present, in an unchanging vision and thus need not resort to reasoning.<sup>44</sup> We learn elsewhere that this is *a fortiori* true of Nous, where the future is already present; or rather temporal distinctions have no meaning there, but become operative only with the unfoldment of the sensible world.<sup>45</sup> That the idea is of Stoic origin is shown by Cicero's *De Divinatione*,<sup>46</sup> where we read that, since the world unfolds from its causes according to the law of Fate, one who knows all causes thereby knows all effects. Such knowledge however, is possible only to the gods, who, we learn elsewhere in the treatise, know the universe since they are its cause.<sup>47</sup> For man, however, it is possible only to draw partial inferences from partial effects (artificial mantic exemplified by astrology or the inspection of omens) or at best to observe some of the world's causal principles directly when his mind is freed from the body's influence in prophetic ecstasy or sleep (natural mantic). This distinction between two kinds of mantic was to have great influence on

later thought.<sup>48</sup> All that concerns us here, however, is that Plotinus's contrast between divine knowledge and the inferences of human diviners exactly parallels Vasubandhu's, with the exception that the idea of divine causal knowledge is absent from the latter, since the Buddha, unlike the Stoic or Neoplatonic God, is in no sense the world's cause or creator.<sup>49</sup>

We have thus a further remarkable parallel between Neoplatonism and the Buddhist circles within which the Yogācāra arose. We may now examine some further parallels with the *Uttaratantra* itself. It is essential to Neoplatonic emanation, as opposed to Christian creation, that beings "are not thrown into existence by an external creator without any choice on their part. On the contrary, they come forth voluntarily from this source and shape themselves."<sup>50</sup> Hence the later Neoplatonists' description of them as *αὐθυπόστατα*, a concept whose origin has recently been brilliantly illuminated by Professor Whittaker<sup>51</sup> who observes that "the main objective behind the introduction of self-generating secondary principles was . . . that of preserving unimpaired the immobility of the first principle, if the first principle is to remain immobile it cannot generate, and in consequence any secondary principle must proceed from it rather than be generated by it."<sup>52</sup> As Whittaker shows, while the term *αὐθυπόστατος* is not found before Iamblichus, the notion of a self-generating deity was a "theological common-place of the Roman Empire" and synonymous terms are widespread throughout its religious texts. And though such terms are absent from Plotinus, the notion itself is a necessary corollary of his system.<sup>53</sup> Hence the *Uttaratantra*'s use of the term "self-sprung" or equivalent phraseology affords yet another parallel to the Neoplatonic and contemporary Greek systems, the most revealing example being at IV.59 (at the end of the Brahmā simile):

IV.59. As owing to the vows of Brahmā himself,  
This vision is perceived without effort,

so is the apparitional form (of the Buddha),  
which becomes originated by itself.<sup>54</sup>

The other main analogy used by the Neoplatonists to express the emanation concept was that of the Logos, whereby "just as external speech (*logos prophorikos*) constitutes the external expression of internal thought (*logos endiathetos*), so an hypostasis flows forth from its prior and expresses it under conditions of greater multiplicity."<sup>55</sup>

In the *Uttaratantra* (1.143) a similar analogy is used of the relation of the Buddha's teaching to the Dharmakāya: "The cosmical body is to be known in two aspects: It is the Absolute perfectly immaculate and its natural outflow, the word which speaks of the profound (highest truth), And (of the elements of the Empirical World) in their variety."<sup>56</sup>

I pass over other resemblances between the two systems, which seem to me less significant. Thus, the idea that Ultimate Reality transcends conceptual thought is common to mystics the world over.<sup>57</sup> More doubt may be felt over the use, by both Plotinus and the *Uttaratantra* of the simile of cleaning gold or a statue that has fallen into mud,<sup>58</sup> as a symbol of spiritual purification, but on reflection the simile seems one that might occur independently to two minds. I will therefore pass to two final uses of the sunlight analogy, which seem to afford better evidence of contact between the two systems. The first concerns the Neoplatonists' use of light, based on *Parmenides* 131B, as an illustration of how True Being can be simultaneously present in its entirety at every part of the sensible world.<sup>59</sup> Similarly in the *Uttaratantra* we read:

I.83. It is the Cosmical Body, it is the (Buddha)—one  
with the absolute,  
It is the Highest Truth and point of saintliness, and it  
is Nirvana,  
Just as the sun and its rays, so are its properties,  
indivisible,

Therefore, there is no Nirvana apart from Buddhahood. . . .

85. (It is the Cosmical Body, since)  
The properties of the Buddha are indivisible  
(manifesting themselves in all that exists).<sup>60</sup>

And further on:

The Divine Knowledge of all the objects of cognition . . . penetrates into all the objects cognizable in all their forms; it is thus akin to the net of (the sun's) rays which is spread (over everything perceptible) . . . All these properties [viz. Analytic Wisdom, Divine Knowledge and Deliverance from Defilement] constitute the indivisible nature of the absolute, therefore they resemble (the light, the rays and the disc of the sun) in their indivisible character. <sup>61</sup>

Yet both the Neoplatonists and the *Uttaratantra* recognize the limits of the analogy, since the sun is a physical body of limited dimensions occupying a definite place. Hence, Porphyry observes the sun is not present everywhere that its light reaches in the way that the soul, not being circumscribed by spatial dimensions, is simultaneously present at every point in the body.<sup>62</sup> Likewise the *Uttaratantra* remarks that the sun's light cannot penetrate all the different worlds and all regions of the sky in the way that the Buddha's illumination penetrates everywhere and extinguishes all ignorance.<sup>63</sup> Yet more revealing is the work's comparison (IV.77) of the absolute to space:

IV.77. Although it [sc. space] is experienced (as divisible)  
In higher and lower (parts),  
This is not its true nature,  
Which is that of being one whole.  
Similarly, though the Buddha is seen in all his  
different forms,

He is not such as we perceive him  
(Being unique and undifferentiated).<sup>64</sup>

An explanation is necessary at this point of the Sanskrit term *ākāśa*, here rendered "space" and sometimes alternatively translated "ether." Not merely does the term denote "space" in our sense; as Conze remarks: "At the same time, and without any sense of being inconsistent, the Buddhists treat *ākāśa* as something which has ■ material and positive nature, as a finely material, ethereal fluid which is eternal and omnipresent. The ether is itself unsupported by anything . . . but it supports all the other primary elements. First the element of air rests on it, and then again water and earth rest on the air below them. Finally the ancient traditions of India induced the Buddhists to treat this ether as self-illuminating, and to derive the word *ākāśa* from the root *kāś*, "to shine." Āryadeva tells us that the absence of matter is called *ā-kāś-a* because things therein "shine brilliantly," and in this sense Saramati can say that Buddhahood shines brilliantly like the sun or the ether."<sup>65</sup>

This resemblance between *ākāśa*, as so conceived, and Aristotle's fifth element, or light in the Neoplatonic universe, is evident. Conversely we may recall that Proclus, according to Simplicius, identified space with light, partly on the ground of the latter's indivisibility and impassibility.<sup>66</sup> And it is precisely these two qualities that form the basis of the *Uttaratantra*'s comparisons between *ākāśa* and the absolute. The former we have already noted. With regard to the latter we read (I.61-62):

61. The Spiritual Essence is like space,  
Being uncaused and unconditioned.  
It is devoid of the complex (of producing factors)  
And knows no birth, destruction, and (temporary)  
stability.

62. The Spiritual Essence which is pure and radiant  
Is unalterable like space

And cannot be polluted by the occasional stains.  
Of desire and the other (defiling forces)  
Which arise from the wrong conception (of  
existence).<sup>67</sup>

The Neoplatonists similarly use the analogy of the union of light with air to illustrate how the soul's presence in the body involves no substantial intermixture (contrary to Stoic belief) and hence leaves the soul unchanged and unaffected by the passions of the psycho-physical organism.<sup>68</sup> It will be recalled that the passage quoted earlier from Ramana Maharshi used the ether analogy to make a similar point,<sup>69</sup> and here, we observed, there was a precedent in Hindu tradition, namely *Bhagavadgītā* IX.4-9. The relevant verses, in Zaehner's translation, are as follows:

IX.4. By me, unmanifest in form, all this universe was spun: in me subsist all beings, I do not subsist in them. . . .

IX.6. As in [wide] space subsists the mighty wind blowing [at will] ever and everywhere, so do all contingent beings subsist in me. . . .

IX.9. These works (of mine) neither bind-nor-limit me; as one indifferent I sit among these works, detached.

With this we may compare *Enn.* IV.3.22.1-7:

Ἄρ' οὖν οὕτω φατέον, ὅταν ψυχὴ σώματι παρῇ, παρῆναι αὐτὴν ὡς τὸ φῶς πάρεστι τῷ ἀέρι; καὶ γὰρ αὐτὸ καὶ τοῦτο παρὸν οὐ πάρεστι καὶ δι' ὅλου παρὸν οὐδενὶ μίγνυται καὶ ἔστηκε μὲν αὐτό, ὃ δὲ παραρρεῖ· καὶ ὅταν ἔξω γένηται τοῦ ἐν ᾧ τὸ φῶς, ἀπῆλθεν οὐδέν ἔχων, ἕως δὲ ἐστὶν ὑπὸ τὸ φῶς, πεφῶτισται, ὥστ' ὀρθῶς ἔχειν καὶ ἐνταῦθα λέγειν, ὡς ὁ ἀῆρ ἐν τῷ φωτὶ, ἥπερ τὸ φῶς ἐν τῷ ἀέρι.

The two passages thus agree on the following points: (a) the union (of soul with body in one case, of God with the world in the other) resembles that of light (or ether) with air in that (b) the air blows through the ether (or flows by—*παρρρεῖ*), while leaving the latter detached or unmixed; hence (c) we should not say that the soul is in body (or God in the world), but the reverse.

In light of such parallels I find the hypothesis of cultural contact hard to resist. The question remains, if this is so, which system is influencing the other. In favour of the priority of the Neoplatonic texts, we may observe (a) that they antedate the datable Mahāyāna philosophers we have mentioned and (b) that, while the Mahāyānists generally state their views dogmatically and appear to regard them simply as following from the nature of the Absolute, Plotinus generally argues his position at length and usually takes as his starting-point the arguments of earlier Greek philosophers.<sup>70</sup> On the other hand, we saw that the Buddhists allude to earlier scriptures of uncertain date; hence the fact that I have not found their views argued anywhere in as much detail as those of the Neoplatonists may be due simply to my own ignorance, or to gaps in our current knowledge of the Mahāyāna's development. We may likewise observe that, while the text quoted from the *Bhagavadgītā* is obscure in the extreme, Plotinus's meaning can be grasped without undue difficulty. Yet it would be hard to assign a post-Plotinian date to the *Gītā* as a whole,<sup>71</sup> though the possibility of later interpolations cannot definitely be excluded. In short, the question which tradition is influencing the other must for the moment remain uncertain and the possibility of influences both ways must be borne in mind.<sup>72</sup> I hope, at any rate, that the present paper has provided at least a start towards the investigation of this question and offered some guidance as to how it can most profitably be pursued.

## NOTES

1. The most complete study so far is I. F. Staal's *Advaita and Neoplatonism* (Madras, 1961); cf. especially his survey (pp. 235-49) of earlier scholars' views on possible connections between Plotinus and Indian thought. More recently, cf. E. R. Dodds, *Pagan and Christian in an Age of Anxiety*, p. 88, and A. H. Armstrong, *Cambridge History of Later Greek and Early Medieval Philosophy*, p. 201, n. 1.
2. Cf. J. M. Rist, *Plotinus, the Road to Reality*, pp. 228-9, criticizing E. Bréhier's excessive assimilation of Plotinus's thought to Advaita Vedānta.
3. *Science and Civilization in China*, Vol. I, pp. 150-7, esp. pp. 150, 155. The whole section (pp. 150-248) forms a most valuable survey of cultural contacts between China and the West.
4. *Buddhism; Its Essence and Development*, p. 143. For further parallels, cf. the same author's *Thirty Years of Buddhist Studies*, pp. 49-50, 170-2, 207-9, and 217-20.
5. E. Obermiller, trans., *Acta Orientalia*, IX (1931), pp. 111-296; cf. below, p. 105.
6. "Nous as Experience," *Neoplatonism, Ancient and Modern*, Vol. I, pp. 121-55.
7. Cf.: Santideva, *Bodhicaryāvatāra*, IX.17 ff., and pp. 113 ff. of Marion L. Matics' introduction to his translation; Gampopa, *Jewel Ornament of Liberation*, trans. H. V. Guenther, pp. 209-11; T. R. V. Murti, *The Central Philosophy of Buddhism*, pp. 317 ff. Note especially the charge, which Guenther (op. cit., p. 227, n. 20) regards as unjust, that the Yogācārins identify the absolute with "Thought cognizing itself"; cf. Plotinus's criticism of Aristotle as discussed, e.g., by Armstrong, *Les Sources de Plotin* (Études Hardt V), pp. 409-11.
8. Cf. especially Obermiller (p. 135): "Just as the sun casts its light on all the visible objects, in the same way the path makes clear everything cognizable in all the different aspects."
9. *Enn.*, VI.1.6.22-30: τὸ οὖν γινώμενον ἐκεῖθεν ὡς κινήθεντος φατέον γίνεσθαι. εἰ γὰρ κινήθεντος αὐτοῦ τι γίνετο, τρίτον ἂν ἐκείνου τὸ γινώμενον μετὰ τὴν κίνησιν ἂν γίνετο καὶ οὐ δεύτερον. δεῖ οὖν ἀκινήτου ὄντος, εἴ τι δεύτερον μετ' αὐτῆς, πῶς προσηύδατος οὐδὲ βουληθέντος οὐδὲ ὅλως κινήθεντος ὑποσῆναι αὐτῆς. πῶς οὖν, καὶ τί δεῖ νοῆσαι; περὶ ἐκεῖνο μὲν ὄν, περιλαβὼν ἐξ αὐτοῦ μὲν, ἐξ αὐτοῦ δὲ μένοντος· ὅσον ἡλίου τὸ περὶ αὐτὸν λαμπρὸν ὥσπερ περιθέον, ἐξ αὐτοῦ αἰεὶ γιννόμενον, μένοντος δέ.

11. IX.4-9, on which cf. below, p. 114.
12. "Les Trois Hypostases dans l'Inde et à Alexandrie," *Ann. de Inst. de Philol. Orientale*, IV (1936).
13. Obermiller, pp. 253-4, 263-4. On the obscurity of the Sāmbhogakāya doctrine, cf. Conze, *Thirty Years of Buddhist Studies*, p. 72, and *Buddhist Thought in India*, pp. 233-4.
14. Cf., e.g., T. R. V. Murti, *The Central Philosophy of Buddhism*, p. 107, n. 6.
15. See Richard A. Gard, *Buddhism (Great Religions of Modern Man)*, p. 22. Cf. also A. K. Chatterji, *The Yogācāra Idealism*, p. 53 and n. 3, for the possibility of the existence of several philosophers of that name.
16. Believers in reincarnation might also note that A.D. 270, the traditional date of Maitreya-nātha's birth, was also that of Plotinus's death!
17. Cf., e.g., Obermiller: p. 113, n. 2; p. 114, n. 11; p. 115, n. 4; p. 128, nn. 1 and 5; p. 153, n. 3; p. 189, n. 2; p. 269, n. 2; p. 280, n. 5; p. 284, n. 2; and p. 285, n. 1.
18. Cf. Conze, *Buddhism; Its Essence and Development*, pp. 29-31, on the uncertainties of Indian chronology; also, *Thirty Years of Buddhist Studies*, p. 19, where, in an article originally published in 1960, he declares that "perhaps five percent of the *Mahāyāna Sūtras* have been reliably edited and perhaps two percent intelligibly translated. It is clear that inferences drawn from the scanty material at our disposal must remain extremely dubious." Clearly, even allowing for the progress of research since then, the same general conclusion must hold true.
